There can be little doubt that hydrophobia is a specific disease due to a multiplication of some virus in the nervous system, in the elements of which it is ultimately fixed; that it passes from the wound to the central nervous system by the lymphatics, and that, as in tetanus, the muscular spasms are the result of the action of some special poison on the central nervous system.

Scarlet Fever.—In scarlet fever recent observations have been comparatively few and unimportant. Craoke, and later Klein,
PARASITIC DISEASES

and others have, however, shown that in the glands and throats of scarlet fever patients a streptococcus, to which is assigned the chief aetiological rôle in connexion with this disease, is present. On the other hand, it is maintained by many observers that these streptococci are nothing more than the streptococci found in purpural fever, erysipelas, and similar infective conditions, and certainly the organisms described closely resemble *Streptococcus pyogenes*. In 1904 Mallory described certain "bodies" which he considers may be associated with scarlet fever, and which were sufficiently distinctive to justify him in suggesting that he was dealing with the "various stages in the developmental cycle of a protozoon." These bodies, which were demonstrated in four cases of scarlet fever, "occur in and between the epithelial cells of the epidermis and free in the superficial lymph vessels and spaces of the corium." They are small, varying from the size of a blood platelet to that of a red blood corpuscle, and "stained delicately but sharply with methylene blue." Well formed rosettes with numerous segments may be seen, forms which Mallory thinks may correspond to the phase of asexual development of the malarial parasite. He also describes "coarsely reticulated forms which may represent stages in the sporogony or be due to the conditions of the other forms." He gives beautiful illustrations, both drawings and photographs, of these organisms, and without claiming that he has proved any aetiological relation between these bodies and scarlet fever, states that his personal opinion is that such relation exists.

D.—Infective Diseases not yet proved to be due to Micro-organisms.

Small-pox.—There have been few recent additions to our knowledge of the aetiology of small-pox, though Dr Monckton Copeman now holds that the small-pox organism, like that of vaccine, is probably a very minute bacillus, which, from its behaviour in the presence of glycerin, is possessed of the power of forming spores. If vaccine lymph, taken from the calf, be protected from all extraneous spore-bearing organisms and treated with 50% solution of glycerin, it, in time, becomes absolutely sterile as regards ordinary non-spore-bearing organisms. Even the staphylococci and streptococci, usually found in call lymph, cannot withstand the prolonged action of this substance, but spore-bearing organisms still remain alive and active. Moreover, the lymph still retains its power of producing vaccine vesicles, so that the vaccine organism, in its powers of resistance, resembles the spore-bearing, and not the non-spore-bearing, organisms with which we are acquainted. This vaccine organism must be very minute; it is stated that it can be cultivated only on special media, though it multiplies freely in the superficial cutaneous tissues of the calf, the monkey and the human subject. Perhaps the most important outcome of Dr Monckton Copeman's work on this subject is that he has obtained a vaccine lymph from which are eliminated all streptococci and staphylococci, and, if the lymph be taken with reasonable care, any other organisms which could possibly give rise to untoward results.

Typhus Fever.—Although it is fully recognized that typhus must be one of the specific infective fevers brought about by the action of a special micro-organism, no definite information of this nature has as yet been obtained. It is always looked upon as a "filth" disease; and from the frequency of minute haemorrhages, and from the resemblance to the haemorrhagic septicaemias in other respects, it appears probable that the bacillus of typhus is the organism described by Mott in 1883 as an actively motile dumb-bell coccus, and ten years later by Dubieff and Bruhl as the *Diplococcus typhosus exanheumaticus*; the polar staining and general resemblance to the diplococcus of fowl cholera, the plague bacillus, the diplococcus of "Wildseuche," certain forms of swine fever and hog cholera, and others of the haemorrhagic septicaemias, are sufficient to suggest the generic affinity of this organism to this septicemic group. We have as yet, however (1910), no absolute proof of the aetiological relation of the bacillus to this disease.

Measles.—In measles, as in scarlet fever, micrococci have had ascribed to them the power of setting up the specific disease. Canon and Fielicke have, however, described minute bacilli somewhat resembling those as described in vaccinia lymph. These are found in the blood in the early stages of the disease, and also in the profuse catarrhal secretions so characteristic of this condition. There are no records of the successful inoculation of this minute bacillus, and until such evidence is forthcoming this organism must be looked upon as being an accessory, possibly, but not the prime cause, of measles.

Mumps.—It is generally accepted that mumps is probably caused by a specific micro-organism, the infective material making its way in the first instance through the ducts to the parotid and other salivary glands. It appears to bring about a peculiar oedematous inflammation of the interstitial tissue of the glands, but slight parenchymatous changes may also be observed. The virus is present in the tissues for some days before there is any manifestation of parotid swelling, but during this period it is extremely active, and the disease may be readily transmitted from patient to patient. The infectivity continues for some time, probably for nearly a week after naked-eye manifestations of the diseased condition have disappeared.

Whooping-Cough A diplococcus, streptococcus, and various higher fungi have in the past been put down as the cause of this disease. It must, from its resemblance to the other specific infective fevers, be considered as an infective disease of microbial origin, which goes through a regular period of incubation and invasion, and in which true nervous lesions, especially of the pneumogastric and superior laryngeal nerves, are somewhat common.

Affansieff, and later Koplik, have described a minute bacillus, with rounded ends and bi-polar staining, which occurs in the mucus discharged at the end of a paroxysm of whooping-cough. Koplik examined sixteen cases, and found this organism in thirteen of them. There can be little doubt that the infective material is contained in the expectoration. It may remain active for a considerable period, but is then usually attached to solid particles. It is not readily carried by the breath, and multiplies specially in the mucous membranes, setting up inflammation, probably through its toxic products, which appear to be absorbed, and, as in the case of the tetanus poison, to travel specially along the lymphatics of the local nerves. Affections of the lung—bronchitis and broncho-pneumonia—may be directly associated with the disease, but it is much more likely that these affections are the result of secondary infection of tissues already in a weakened condition.

PARASITISM, in biology, the condition of an organism which
its nourishment wholly or partially from the body of
another living organism, and which usually brings about extensive modifications in both guest and host, a phenomenon
widespread amongst animals and plants. The term has been
appropriated by biologists as a metaphor from the Greek (see
Parasite). The lives of organisms are so closely intermeshed
that if dependence on other organisms for food be the criterion
of parasitism it is doubtful if any escape the taint.
Green
plants, it is true, build up their food from the inorganic elements
of the air and the soil, and are farthest removed, from the suspicion of dependence; but most, if not all, thrive only by the aid
of living microbes either actually attached to their roots or
swarming in the nutrient soil. Saprophytes, organisms that
live on organic matter, are merely parasites of the dead, whilst
all animals derive their nourishment from the bodies of plants,
either directly or indirectly through one or more sets of other
animals. It is plain, therefore, that if parasitism is to be employed as a scientific term it must connote something more
than mere dependence on another living organism for nutrition.
The necessary additional conceptions are two: the bodies of
obtains


PARASITISM

host and parasite must be in temporary or permanent physical contact other than the mere preying of the latter on the former; and the presence of the parasite must not be beneficial, and is usually detrimental to the host.

It is to be observed that the limits of the strictest definition of parasitism will cover the facts many degrees occur. The terms symbiosis and commensalism have been applied to conditions really outside the definition of parasitism, but closely related and usually described in the same connexion. Both terms cover the physical consortings of organisms in such a fashion that mutual service is rendered.

The name symbiosis was invented by the botanist A. de Bary in 1879, and is applied to such an extraordinary community as the thallus of a lichen, which is composed of a fungus and an alga so intimately associated, physically and physiologically, that it was not until 1868 that the dual nature of the whole was discovered. The presence of chlorophyll, which had always been associated only with vegetable organisms, was detected by Max Schultze in 1851 in the animals Hydra and Vortex, and later on by Ray Lankester in Spongia and by P. Goddes in some Turbellarian worms. On the theory that the chlorophyll occurs in independent vegetable cells embedded in the animal tissues, such cases form other instances of symbiosis, for the oxygen liberated by the green cells enables their animal hosts to live in fouler water, whilst the hosts provide shelter and possibly nutritious food to their guests.

The term commensalism was introduced in 1876 by P. J. Van Beneden to cover a large number of cases in which “animals have established themselves on each other, and live together on a good understanding and without injury.” The most familiar instance is that of fishes of the genus Fiersaster which live in the digestive tube of sea-cucumbers (Holothuria; see Echinodermata). A variety of commensalism was termed mutualism by Van Beneden and applied to cases where there appeared to be an exchange of benefits. A well-known instance of mutualism is the relation between sea-anemones and hermit crabs. The hermit crab occupies the discarded shell of a mollusc, and anemones such as Sagartia or Adamsia are attached to the outside of the shell. The bright colours of the anemone advertise its distasteful capacity for stinging, and secure protection for the crab, whilst the anemone gains by vicarious locomotion and possibly has the benefit of floating fragments from the food of the crab.

It is plain that such terms as symbiosis, commensalism and mutualism cannot be sharply marked off from each other or from true parasitism, and must be taken as descriptive terms rather than as definite categories into which each particular association between organisms can be fitted.

R. Leuckart has made the most useful attempt to classify true parasites. Occasional, or temporary, parasites are to be distinguished from permanent, or stationary, parasites. The former seek their host chiefly to obtain food or shelter and are comparatively little modified by their habits when compared with their nearest unparasitic relatives. They may infest either animals or plants, and as they attack only the superficial surfaces of their hosts, or cavities easy of access from the exterior, they correspond closely with another useful term introduced by Leuckart. They are Epizoas or Ectoparasites, as distinguished from Entozoa or Endoparasites. They include such organisms as plant-lice, and caterpillars which feed on the green parts of plants, and animals such as the flea, the bed-bug and the leech, which usually abandon their hosts when they have obtained their object. Many ectoparasites, however, pass their whole lives attached to their hosts; lice, for instance, lay their eggs on the hairs or feathers or in rugosities of the skin of birds and mammals; the development of the egg, the larval stages and the adult life are all parasitic. Permanent or stationary parasites are in the most cases endoparasitic, inhabiting the internal organs; bacteria; gregarines, nematodes and tapeworms are familiar instances. But here also there are no sharp lines of demarcation. Leuckart divided endoparasites according to the nature and duration of their strictly parasitic life: (1) Some have free-living and self-supporting embryos that do not become sexually mature until they have reached their host; (2) others have embryos which are parasitic but migratory, moving either to another part of their host, to another host, or to a free life before coming mature; (3) others again are parasitic in every stage of their lives, remaining in the same host, and being without a migratory stage.

Origin of Parasitism.—Now that the theory of spontaneous generation has been disproved, the problem of parasitism is no more than detection of the various causes which may have led organisms to change their environment. Every kind of parasite has relations more or less closely akin which have not acquired the parasitic habit, and every gradation exists between temporary and permanent parasites, between creatures that have been only slightly modified and those that have been profoundly modified in relation to this habit. There are many opportunities for an animal or plant in its adult or embryonic stage to be swallowed accidentally by an animal, or to gain entrance to the tissues of a plant, whilst in the case of ectoparasites there is no fundamental difference between an organism selecting a dead or a living environment for food or shelter. If the living environment in the latter case proves to have special advantages, or if the interior of the body first reached accidentally in the former case prove not too different from the normal environment and provide a better shelter, a more convenient temperature, or an easier food supply, the recipient may lose its former habits, and themodation to which parasitism exists amongst animals and plants it is clear that it must have arisen independently in an enormous number of cases, and it may be supposed that there must be many cases in which it has been of recent occurrence; E. Metchnikoff, indeed, has suggested that amongst parasites we are to look for the latest products of evolution. In any case it is impossible to suppose that parasites form a natural group; no doubt in many cases the whole of a group, as for instance the group of tapeworms, is parasitic, but indications point clearly to the tapeworms having had free-living ancestors. Parasitism is in short a physiological habit, which theoretically may be assumed by any organism, and which actually has been assumed by members of nearly every living group.

LIST OF PARASITES

A.—Animals.

Vertebrata.—These are rarely parasitic, and cases are unknown amongst mammals, birds, reptiles and amphibians. Amongst fish and cyclostomes, Myxine burrows into codfish, Remora attaches itself to the external surface of sharks; Rhodens amarus, the bitering, a small, carp-like fresh-water fish, injects its eggs into the body of the goby (Gobius), which is killed thereby, whilst the mollusc reciprocates by throwing off its embryos on the parent fish; Stegocephus insidiosus, a small colourless fish from Brazil and the Argentine, lives parasitically in the gill-cavity of large cat-fishes and sucks the blood in the gills of a large Silurid; Vandella cirrhosa, the candiru of Brazil, a minute fish 60 mm. in length, enters and ascends the urethra of people bathing, being attracted by the urine; it cannot be withdrawn, owing to the erectile spines on its gill-cover. The natives in some parts of the Amazon region make use of this fish to clear the water by wearing a sheath of minutely perforated coco-nut shell.

Mollusca.—Few if any are true parasites. The Gastropods, Entimae, Styliferae and Entoconae lodge in Echinoderms, the latter at any rate being only temporarily host.

Protocordata and Hemichordata.—Most of these are sessile and may lodge on other animals, but are not parasitic.

Arachnida.—Mites and Ticks are Arachnids, the vast majority of which are parasitic; the mite infest almost every vertebrate group, but there are some free-living forms. Pycnogonids are parasitic in their youthful stages on Hydroids, whilst the Pentatamoids have been so much modified by parasitism that they were long regarded as worms; they may occur in all vertebrates. Crustacea. These contain a large number of forms in all stages of parasitic. Some Copepods are amongst the most degenerate parasites known, the so-called fish-lice being for the most part Copepods with piercing mouth-organs, elaborate clinging apparatus, and degenerate organs of locomotion. In Lernae, the female, after becoming attached to its host, undergoes a retrogressive metamorphosis, losing almost completely the segmentation of the body and discarding the appendages and sense-organs, whilst the male, although not so degenerate in structure, is dwarfed in size and itself becomes a parasite of the female. The Copepods
PARASITISM

are all sessile in the adult condition. The Lepidoptera are the least modified and are rarely parasitic; the Bulinidae are more modified and frequently become embedded in the skin of whales. The Abdominalia live as parasites buried in the shells of other Cirripeds and barnacles. The Apoda live as parasites in the mantle cavities of other Cirripeds, whilst the Rhizocephala live chiefly on the abdomen of Decapod Crustacea, sending burrowing root-like nutritive processes into their tissues.

Insects.—A very large number of insects are temporary or permanent parasites of animals or plants, the adult stages being chiefly ectoparasitic, the larval stages endoparasitic. The Hemiptera, allies of the earwigs, are ectoparasites on rats. The Mallophaga or bird-louse are degenerates wingless insects spending their whole life on birds. Many of the larvae of Hemerobiinae are parasitic on Aphiidae. The saw-flies are parasitic on plants. There are over 200,000 species known of the Hymenoptera parasitica or Terebrantia. The adults deposit their eggs in the bodies of other insects, and the larvae that develop are internal parasites. Many of them are parasites of domesticated and wild animals, and the parasites of the house-fly, the blue-bottle, and the blow-fly are by far the most powerful. The ear-wig, or Lepidoptera. The clothes-moth, for instance, is known to be subject to the attack of over sixty species of Hymenoptera. To such an extent has parasitism been developed in this group, that the parasites themselves are attacked by other parasites, giving rise to the phenomena known as hyperparasitism. The gall-flies (see GALLS) are included amongst the Terebrantia, but in their case the early stages are passed in vegetable galls more frequently than in the bodies of animals. The Mantidae, Mantididae, and a very large number of Hymenoptera are parasitic in the larval condition as parasitic on the larvae of wasps and bees. The Drosidae are bees that in the larval stage are parasitic on other bees, the larvae of the parasites being deposited in the food-cells prepared for their own larval food. Many of the larvae of the leaf-cutting bees are parasitic on larvae of ants; and the mature larvae of ants with other insects must be referred to in connexion with ants. The nests of many species are inhabited by foreign insects of various orders, such insects being termed myrmecophiles or ants-insect. The larvae of bees are known to be parasitic on honey-combs, and the bees migrate with their hosts. Aphidae, Coccidae and other bugs that secrete sugary matter are cherished and attacked by ants; so also the caterpillars of some Lycaenid butter flies are associated with ants of some kind. Some species of ants are very useful parasites. There are also many Orthoptera, Hemiptera, and other insects, as well as some acarids and wood-louse found only in ants' nests as cherished or tolerated guests. The relations between ants and parasites are a very instructive and peculiar example of parasitism, and may be classified under the head of mutualism. The adult stages of the parasites are one minute and helpless, and are carried from the nests of ants to the nests of birds, where they are laid on the eggs of the parasites of birds, or they are themselves the parasites of birds, a relationship which is complicated and less understood than the former. The staphylinidae, Cerambycidae, and other Coleoptera, as well as many Diptera, are parasitic on insects, and the parasites are in a way or other carried to their hosts. The parasites of bees may be divided into two classes: in the first class the parasites are able to escape from the nests of bees, but in most cases so highly modified as to be capable of existence only on the particular species with which they are associated. Lower Invertebrates.—No true Chaetopods are parasitic, but a few are commensals. The leeches are probably Chaetopods modified by parasitism; and Myzostomes are still more highly modified, for they are relatives of the group, very degenerate and parasitic on Crinoids. A few rotifers are ecto- and endo-parasites. Brachiopoda, Polyzoa or Echinoderms are true parasitae. The flat-worms and round-worms contain the most characteristic endoparasites, and parasitic worms form a very large family of animals, which is of importance from a zoological point of view, as it has been discussed in the separate articles dealing with the various natural assemblages of such worms. All the Cestodes (see TAP-WORMS), most of the Trematodes (q.v.), and a few of the Planarians (q.v.) have been referred to in the articles on their respective families. Cestodes and tapeworms are the most degenerate of the parasitic worms, and it is hardly possible that the Ascaris larvae of Helminthes, for instance, are not endoparasitic in the ovaries of the crustacean Galathea strigosa, whilst Eumermes and Tetrastemma occur on Ascidians, and Macalolebias in lamellibranch Molluscs. The Terebrantia, including the Leeches, are very degenerate parasites. The Nemertes (q.v.) or typical round-worms, exhibit every degree from absolute free-living to absolute parasitism in animals and plants. The Echiuroidae (q.v.) are mostly free-living, but the male of Benthia lives as a very degenerate parasite in the uterus and pharynx of the female. Although Coelentera and Porifera are usually sessile, very few are true parasites; young stages of the Narcomedusae are parasitic in the9 intestines of crustaceans, and in the larval stage anthozoan parasites is a degenerate medusa living on the pelagic mollusc Phylliodes. The Protozoa, from their minute size and capacity to live in fluids, naturally include an enormous number of parasitic forms, the importance of which in producing disease in their hosts is so great that they have been the subject of a special and distinct branch of Pathology. The Sacrecina (q.v.) many forms of Amoeba such as Amoeba coli are associated with dysentery and kindred diseases. A very large number of the Malsiphora (q.v.) are parasitic on certain of the Kinetoplastids, as are the larvae of the parasitic Tardigrada. The males of such parasites are parasitic; in fact, observation by adequate means of the juices of almost any animal reveals the occasional presence of some kind of mobile protozoan, provided with a whip-like process. The endoparasites of the group of Sporozoa (q.v.) are entirely parasitic, and have been found in every group of animals except the Protozoa and Coelentera. Infusoria (q.v.) contain a considerable number of parasitic forms, some endoparasitic; others like the Suctoria, ectoparasitic.

Plants.—Bacteria.—Every degree of adaptation to parasitism occurs amongst bacteria, a majority of which pass at least some stage of their lives in a parasitic condition.

Fungi.—As in the case of Bacteria, the absence of chlorophyll from the tissues of fungi makes it necessary that they should take up carbon from compounds already assimilated by other organisms, and accordingly they are either saprophytes or parasites. The mycelium is, so to say, the parasitic organ of the fungus, ruminating in the tissues of the host. The plant may obtain access to its host by the imaginative term of mycorrhiza, by the more restricted term of roothairs and air-passages of mammals and birds, or by the more restricted term of root-hairs and air-passages of mammals and birds, or occasionally by natural apertures such as the stomata of plants. The fungi that develop in the organs of warm-blooded animals reach the blood-stream through wounds, and thence spread to the tissues where germination takes place. Many cochleatae are parasites of the scutaria that host by germinating tubes which emerge from the spore and penetrate either by a natural or artificial aperture, whilst in other cases the germinating tubes or hyphae actually penetrate unjured tissues or membranes.

The fungi parasitic on animals are in most cases little known, and additions to the list, of which the pathological rather than the botanical features have been worked out, are constantly being made. The number of species of Ascomycetes, usually saprophytic, may migrate to the bodies of animals, spreading in the tissues and exciting a disease known as mycosis or aspergillosis. They were first described in the disease of the human ear known as otitis, and this condition is now regarded as a disease of the external and air-passages of mammals and birds. Recent pathological investigations conducted at the Protectorate of the Zoological Society of London, show that mycosis is extremely frequent and fatal in birds and reptiles, and rather less frequent but very fatal in the great majority of mammals. Many of the fungi of the group of Ascomycetes usually vegetate as saprophytes but readily settle on aquatic animals such as goldfish, salmon, salamanders and frogs, with fatal results. It is not yet entirely certain if diseases of this kind, of which the salmon disease is the most notorious, are produced on healthy animals, by the
PARASITISM

attacks of the fungi, or if some antecedent predisposing condition be necessary. There are a number of well-known fungi that produce diseases of the skin in man and other vertebrates. *Achorion schoenleinitii* produces favus in man, rabbits, cats, fowls and other birds. *Aspergillus flavus* has been isolated from the fungus of tinea or ringworm in man, oxen, horses, dogs and rabbits. *Sclerotium albidens* (Keess), produces thresh of the mouth in young herbstina and birds. *Actinomyces bovis* (Harr) is associated with the corns of cattle and kangooros, but has been found in pigs and human beings.

The fungi parasitic on plants are much better known and are responsible for a large number of diseases. They display every gradation of parasitism comparable to the conditions in parasitism. *Pyrenomyces*, the group Erysiphaceae contain a large number of common parasites; the main body of the fungus is usually epiphytic in various mildews (*p.p.*). Ergot (*q.v.*) is the most familiar example of the group. The *Drechsleraceae* are chiefly saprophytic, being found on dead fruiting roots and so forth, but many of them kill living plants: *Exosoros* on plums, peaches and cherries. *Sclerotinia* is most common on dead juicy fruits, but will destroy turnips in store, and has been known to attack living Phaseolus and Zea. The *Erysiphaceae* are naturally parasitic, but when they gain access through wounds are the most destructive parasites of living timber. The *Oidaceae* are endoparasites in Phanerogams, and are especially notable for their attacks on grasses, the species of *Ergot* being found in the tissues of their hosts, and the enlarged spaces thus formed become filled with the spores of the parasite. The *Uredinae* are also endoparasites of the higher plants and produce the diseases known as rusts. The species of *Ergot* are particularly conspicuous enemies of agriculture and horticulture. *Phytophthora infestans* (de Barro), the potato-disease fungus, is a typical example. *Dactylella* is another rot-producing fungus, and yellow cells found in Hydroids and Planarians referred to in connection with symbiosis and the small green algae that infest the hairs of sloths are on the border-line of parasitism. A species of *Nectococcus* occurs in the interior of the living plants; *Chalmodyllum* is found in the tissues of *Lemna*, and *Phyllostom arisari* (Kilin) infests the parenchyma of *Arum arisarum*.

The flowering plants have a considerable number of representatives. The flowers are usually produced by species which exhibit various degrees of parasitic degeneration. The Monotropaceae allied to the heaths, are degenerate, with no chlorophyll and with scale-like leaves but the evidence as to their parasitism is more than doubtful; they are possibly only saprophytically. The allied Lencaceae, a small group also devoid of chlorophyll and with scale-leaves, are true root-parasites. The genus *Cuscuta* of the Convulvulaceae consists of the true parasites known as dodders. They are destitute of chlorophyll and attach themselves to other plants by twining stems on which occur haustoria that penetrate the tissues of the host and absorb nutritive material. *Cuscuta europaea*, the great dodder, is a parasite of nettles and hops; *Cuscuta epithymum* is the flax dodder; *Cuscuta reflexa* is a species of Kentucky dodders, *Cuscuta trifoliis* is very destructive to clover. Several genera of Scrophulariacae are partially parasitic; they contain chlorophyll but have degenerate roots with haustoria. *Euphorbia*, the eye-bright, is destitute of the roots of grasses; *Pedicellaria*, the lousewort, *Rhinanthus*, the rattle, *Melamphyrum*, the cow-wheat and *Bartsia* are all partly parasitic on the roots of other plants. The Orobanchaceae or broomworts, are all destitute of chlorophyll and have scale-leaves; they are parasitic on the roots of other plants, species attacking different genera of plants being often found together. *Cytisine* are true parasites devoid of chlorophyll and leaves, with deformed bodies and conspicuous flowers or inoffences. Most of them are tropical, and the group is widely scattered throughout the world. Among the species of *Solanum*, all parasites on branches, have chlorophyll, but rather degenerate leaves; others like the tropical *Balanophora* are eucephalous, saprophytic in nature, and parasitic on the bodies of *Loranthus*, a few genera as *Cassytha* (the tropical "dodder-laurels") are true parasites, without chlorophyll and with twining stems.

**Effect of Parasitism on Paracies.**—The phenomenon of parasitism occur so generally in the animal and vegetable kingdoms and are repeated in degrees so varying that no categorical statements can be laid down as to the effects produced on the organisms concerned. All living creatures have a certain degree of correspondence with the conditions of their environment, and parasitism is only a special case of such adaptation. The widest generalization that can be made regarding it is that parasitism tends towards a rigid adaptation to a relatively limited and stable environment, whilst free life tends towards a looser correspondence with a more varying environment. The *sumnum bonum* of a parasite is to reach and maintain existence in the limited conditions afforded by its host; the goal of the free-living organism is a varying or experimental fitness for varied surrounding conditions. As the metaphor be continued, the danger of parasitism for the parasite, is that if it become too nicely adjusted to the special conditions of its host, and fail to attain these, it will inevitably perish. The degeneration of parasites is merely a more precise adaptation; in the favourable environment they degenerate, or specialized parasite is best equipped for successful existence, but the smallest change of environment is fatal. Such a generalization as has been formulated covers nearly all the peculiarities of parasitism. Organs of prehension are notably developed; parasitic plants have twining stems, boring roots and special clinging organs; parasitic animals display hooks, suckers and boring apparatus. The normal organs of locomotion tend to disappear, whether these be wings or walking legs. Organs of sense, the chief purpose of which is to make animals react quickly to changes in the environment, become degenerate in proportion as the changes which the parasite may have to encounter are diminished. The changes correlated with nutrition equally well with the necessities of life; the chlorophyll of the plant becomes unnecessary and tends to disappear. The animal has no longer to thrust a spreading crown of leaves into the tender tissues or greedy rootlets into the soil, but absorbs already prepared nourishment from the tissues of its host through compact conduits. And so the parasitic higher plant tends to lose its division into stem and leaves and roots, and to acquire a compact and amorphous body. The animal has no longer to seek its food, and the little segmentation of a body adapted for locomotion becomes replaced by a squat or insinuating form. Jaws give place to sucking and piercing tubes, the alimentary canal becomes simplified, or may disappear altogether, the parasite living in the juices of its host, and absorbing them through the skin. So, also, parasites obtaining protection from the tissues of their host lose their intrinsic protective mechanisms.

The reproduction of parasites offers many peculiarities, all of which are readily correlated with our generalization. A creature rigidly adapted to a special environment fails if it does not reach that environment, and hence species most successful in reproduction are able to afford the largest number of misers to secure a few hits and so to maintain existence. High reproductive capacity is still more urgent when the parasites tend to bring to an end their own environment by killing their hosts. Reproduction in parasites, so far from being degenerate, displays an exuberance of activity, and an extraordinary efficiency. In parasitic flowering plants the flowers tend to be highly conspicuous, the seeds to be numerous, and specially adapted to ready diffusion. Amongst the fungi, the reproductive processes are most prolific, spores are produced by myriads, and very many special adaptations exist for the protection of the latter during their transference from host to host. It is notorious that the spores of bacteria and the higher fungi resist changes of temperature, desiccation, and the action of physical and chemical agents, to an astonishing extent. Vegetative reproduction is extremely active under favourable conditions, and resting reproductive bodies of varying morphological character are produced in numbers. Among fungi, a phenomenon known as heterocercos development is a special type of parasitic conditions, and recalls the similar adaptations in many animal parasites. At one stage of its existence, the fungus is adapted to one host, at another stage to another host. *Puccinia graminis*, the fungal rust affecting many grasses, is a typical instance. It inhabits wheat, rye and other grasses, developing a mycelium in the tissues of young plants. During the summer, the mycelium gives rise to large numbers of simple processes which break through the tissues of the host and bud off orange-coloured *uredosporium*. These small bodies are scattered by the wind, and reach other plants on which they germinate, enter the new host through the stomata and give rise to new mycelia. Towards autumn, when the tissues of the host are becoming hard and dry, darker-coloured *telusgondonia* are produced, and these remain quiescent during the winter. In spring they germinate, produce
small free-living mycelia on which in due course _sporidia_ are formed. When these, scattered by the wind, fall on the leaf of the barberry-plant, they germinate, and entering the leaf-tissue of the new host by the stomata produce a mycelium bearing reproductive organs so different from those of the phase on the grass-plant, that it was described as a distinct fungus (_Aecidium barberitidis_), before its relation with the rust of grasses was known. The spores of the _Aecidium_ when they reach grasses give rise to the _Puccinia_ stage again.

The reproductive processes of animal parasites are equally exuberant. In the first place, hermaphroditism is very common, and the animals in many cases are capable of self-fertilization. Parthenogenetic reproduction and various forms of vegetative budding are found in all stages of the life-history of animal parasites. The prolificness of many parasites is almost incredible. R. Leuckart pointed out that a human tapeworm has an average life of two years, and produces in that time about 1,500 proglottides, each containing between fifty and sixty thousand eggs, so that the single tapeworm has over eighty million chances of successfully reproducing its kind. The devices for nourishing and protecting the eggs and embryos are numerous and elaborate, and many complex cases of larval migration and complicated cases of heterocercy occur. (See TREMATODE AND TAPEWORM.)

The physiological adaptations of parasites are notable, especially in cases where the hosts are warm-blooded. The parasites tend to become so specialized as to be peculiar to particular hosts; ectoparasites frequently differ from species to species of host, and the flea of one mammal, for instance, may rapidly die if it be transferred to another although similar host. The larval and adult stages of endoparasites become similarly specialized, and although there are many cases in which the parasites that excite a disease in one kind of animal are able to infect animals of different species, the general tendency is in the direction of absolute limitation of one parasite, and indeed one stage of one parasite to one kind of host. The series of events seems to be a gradual progression from temporary or occasional parasitism to obligatory parasitism and to further restriction of the obligatory parasite to a particular kind of host.

**Effect of Parasitism on Hosts.**—The intensity of the effect of parasitism on the hosts of the parasites ranges from the slightest local injury to complete destruction. Most animals and plants harbour a number of parasites, and seem to be unaffected by them. On the other hand, as special knowledge increases, the range of the direct and indirect effect of parasites is seen to be greater. It is probable that in a majority of cases, the tissues of animals and plants resist the entrance of microbes unless there is some abrasion or wound. In the case of plants the actual local damage caused by animal or vegetable ectoparasites may be insignificant, but the wounds afford a ready entrance to the spores or hyphae of destructive endoparasites. So also in the case of animals, it is probably that few microbes can enter the skin or pores of the walls of the alimentary canal if these be not damaged. But as knowledge advances the indirect effect of parasites is seen to be of more and more importance. Through the wounds caused by biting-insects the microbes of various skin diseases and inflammations may gain entrance subsequently, or the insects may themselves be the carriers of the dangerous endoparasites, as in the cases of mosquitoes and malaria, fleas and plague, tsetse flies and sleeping sickness. Similarly the wounds caused by small intestinal worms may be in themselves trivial, but afford a means of entrance to microbes. It has been shown, for instance, that there is an association between appendicitis and the presence of small nematodes. The latter wound the coecum and allow the microbes that set up the subsequent inflammation to reach their nidus. It has been suggested that the presence of similar winding parasites precedes tubercular infection of the gut.

The parasites themselves may cause direct mechanical injury, and such injury is greatly aggravated where active reproduction takes place on or in the host, with larval migrations. A tangled mass of Ascarid worms may occlude the gut; masses of eggs, larvae or adults may block blood-vessels or cause pressure on important nerves. The irritation of the excretory products or the secretion of the parasites may set up a reaction in the tissues of the host leading to abnormal growths (e.g. galls and pearls) or hypertrophies. Migrations of the parasites or larvae may cause serious or fatal damage. The abstraction of food-substances from the tissues of the host may be insignificant even if the parasites are numerous, but it is notable that in many cases the effect is not merely that of causing an extra drain on the food-supply of the host which might be met by increased appetite. The action is frequently selective; particular substances, such as glycogen, are absorbed in quantities, or particular organs are specially attacked, with a consequent overthrow of the metabolic balance. Serious anaemia out of all proportion to the mass of parasites present is frequently produced, and the hosts become weak and fail to thrive. A. Giard has worked out the special case which he has designated as "parasitic castration" and shown to be frequent amongst animal hosts. Sometimes by direct attacks on the primary sexual organs, and sometimes by secondary disturbance of metabolism, the discharge of the parasites retards or inhibits sexual maturity, with the result that the secondary sexual characters fail to appear. The most usual and serious effect on their hosts of parasites is, however, the result of toxins liberated by them. (See PARASITIC DISEASES.)

Finally, the attacks of parasites have led to the development by the hosts of a great series of protective mechanisms. Such adaptations range from the presence of thickened cuticles, and hairs or spines, the discharge of waxy, sticky or slimy secretions, to the most elaborate reactions of the tissues of the host to the toxins liberated by the parasites.

**History and Literature of Parasitism.**—The history and literature of parasitism are divided between the historical and literature of zoology, botany, medicine and pathology. Physiology recognized the mistletoe as a distinct parasitic plant and gave an account of its reproduction by seed. Until the 18th century little more was done in this field. It was not until 1755 that Linnaeus offered _Fungus melolitensis_ (in _Linnaeus's Amoenitiae_ acad. Dissert. LXV. vol. iv.) made a group of parasitic flowering plants, but included epiphytes like the ivy. In 1832 A. de Candolle (_Physiol. végétale_, vol. iii.) attempted to divide and classify flowering parasites on morphological and physiological criteria. It was not until the 19th century that systematic botanists, and especially John Lindley, the founder of the Botanical Magazine, began to publish many systematic works on all botanical treats. With regard to fungi, A. de Bary's treatment on the Comparative Morphology and Biology of the Fungi, _Mycetozoa_ and _Bacteria_ (Eng. ed., 1867) remains the standard work. There is also a large essential literature on bacteriology. With regard to animal parasites, the first real steps in knowledge were the refutation of spontaneous generation (see BIOGENESIS). Linnaeus traced the descent of the liver fluke of sheep from a free-living animal. Magendie, although not a botanist, in his _Theory of Helminthology_, 1832, and T. S. Kohlbrandt's _Parasites_. 1877, have shown how, in some cases, they laid the foundation on which later observers worked, and pointed the way towards discovery of larval migrations and heterocercy. O. Fr. Müller in 1773, and L. H. Bojanus in the beginning of the 19th century reached more nearly to a correct interpretation. J. J. Steenstrup in his famous monograph of which an English edition was published by the Ray Society in 1845 (On the Alteration of Generations, or the Propagation and Development of Animals Parasites, London, 1834) had a great influence on systematic parasitology. A. T. de Lisle's _History of Helminthology_, 1869 and R. Leuckart (The Parasites of Man, Eng. trans., 1886), the former describing a very large number of types, and the latter adding enormously to scientific knowledge of animal parasites, have been recognized by all. C. A. Fleming's Eng. ed. of L. G. Neumann's _Parasites and Parasitic Diseases of the Domesticated Animals_, and the Eng. ed. of Max Braun's _Animal Parasites of Man_ (1906), are complete and comprehensive. (P. C. M.)

**PARASNATH,** a hill and place of Jain pilgrimage in British India, in Hazaribagh district, Bengal; 4480 ft. above the sea; 18 m. from Giridih station on the East Indian railway. It derives its name from the last of the twenty-four Jain saints, who is believed to have here attained nirvana or beatific annihilation. It is crowded with temples, some of recent date; and the scruples of the Jains have prevented it from being utilized as a sanatorium, for which purpose it is otherwise well adapted.
PARASOL——

PARASOL (Fr., from Ital. parasole: parare, to shield, and sole, sun), a sunshade, a light or small form of umbrella, covered with coloured silk or other material. In Japan and China gaily coloured parasols of paper stretched on bamboo frames are used by all classes. The parasol of an elaborate and highly ornamented type has been the symbol of high honour and office in the East, being borne over rulers, princes and nobles. The negro chiefs of West Africa reserve to themselves the privilege of bearing parasols of considerable size and substantial construction, the size varying and denoting gradations in rank.

PARAVICINO Y ARTEAGA, HORTENSIO FELIX (1580—1633), Spanish preacher and poet, was born at Madrid on the 12th of October 1580, was educated at the Jesuit college in Ocaña, and on the 18th of April 1600 joined the Trinitarian order. A sermon pronounced before Philip III. at Salamanca in 1605 brought Paravicino into notice; he rose to high posts in his order, was entrusted with important foreign missions, became royal preacher in 1616, and on the death of Philip III. in 1621 delivered a famous funeral oration which was the subject of acute controversy. He died at Madrid on the 12th of December 1633. His Obras evangélicas (1638—1641) show that he was not without a vein of genuine eloquence, but he often degenerates into vivid declamation, and indulges in far-fetched tropes and metaphors. His Obras pilgrymae, decoras y humanas (1631) include his devout and secular poems, as well as a play entitled "Griponia," his verse, like his prose, exaggerates the characteristic defects of Góngora.

PARAY-LE-MONIAL, a town of east-central France in the department of Saone-et-Loire, 58 m. W.N.W. of Mâcon by the Paris-Lyon railway, on which it is a junction for Moulins, Lozanne, Clermont and Roanne. Pop. (1906), 5382. It lies on the slope of a hill on the right bank of the Bourbince and has a port on the Canal du Centre. The chief building in the town is the priory church of St Pierre. Erected in the 12th century in the Romanesque style of Burgundy, it closely resembles the abbey church of Cluny in the length of the transepts, the height of the vaulting and the general plan. The town is the centre of a district important for its horse-raising; bricks, tiles and mosaics are the chief manufactures of the town. In the 10th century a Benedictine priory was founded at Paray-le-Monial. In the 16th century the town was an industrial centre, but its prosperity was retarded by the wars of religion and still more by the revocation of the edict of Nantes. In 1668 the visions of Marguerite Marie Alacoque, a nun of the convent of the Visitation, who believed herself to possess the Sacred Heart of Jesus, attracted religious gatherings to the town, and yearly pilgrimages to Paray-le-Monial still take place.

PARCEL (Fr. parcelle, Ital. particella, Lat. particula, diminutive of pars, part), a small part or division of anything; particularly, in the law of real property and conveyancing, a portion of a manor or estate, and so the name of that portion of a legal document, such as a conveyance or lease relating to lands, which contains a description of the estate dealt with. The word is also used of a package of goods contained in a wrapping or cover for transmission by carriage, &c., or by post; hence the term "parcel-post" for the branch of the post-office service which deals with the transmission of such packages. "Parcel" was formerly used in an adverbial or quasi-adverbial sense, meaning " partly," " to some extent," thus " parcel-Protestant," " parcel-lawyer," &c. This use survives in " parcel-gilt," i.e. partly gilt, a term applied to articles made of silver with a gilt lining.

PARCHIM (Parchim), a town of Germany, in the grand duchy of Mecklenburg-Schwerin, on the Elbe, which flows through it in two arms, 12 m. S.E. of Schwerin, on the railway from Ludwigslust to Neubrandenburg. Pop. (1905), 10,397. It was the birthplace of Molike, to whom a monument was erected in 1876. It is an ancient place surrounded with walls, and contains a Gothic town hall and two interesting churches. Founded about 1270, Parchim was during part of the 14th century the residence of one branch of the family of the dukes of Mecklenburg. It became a prosperous industrial town during the 16th century, but this prosperity was destroyed by the Thirty Years' War. A revival, however, set in during the 19th century.

See Höhne, Zur topographischen Entwicklung der Stadt Parchim (Parchim, 1899); and Weltziec, Zur Geschichte Parchims (Parchim, 1903).

PARCHMENT. Skins of certain animals, prepared after particular methods, have supplied writing material on which has been inscribed the literature of centuries. Such a durable substance, in most cases easily obtainable in fair abundance, would naturally suggest itself for the purpose, and we are therefore prepared for evidence of its use, and also for the survival of actual specimens, from very ancient times. The tradition of the employment of skins as writing material by the ancient Egyptians is to be traced back to the period of the Pharaohs of the IVth Dynasty, and in the British Museum and elsewhere there exist skin-rolls which date back to some 1500 years B.C. But the country which not only manufactured but also exported in abundance the writing material made from the papyrus plant (see PAPYRUS) hardly needed to make use of any other material, and the instances of skin-rolls inscribed in Egypt must at all times have been rare. But in western Asia the practice of using skins as writing material must have been widespread even at a very early period. The Jews made use of them for their sacred books, and it may be presumed for other literature also; and the old tradition has been maintained by this conservative race down to our own day, requiring the synagogal rolls to be inscribed on this time-honoured material. No doubt their neighbours the Phoenicians, so ready to adapt the customs of other nations to their own advantage, would also have followed the same practice. The Persians inscribed their annals on skins; and skins were employed by the Ionian Greeks, as proved by the words of Herodotus (v. 58). There is no evidence forthcoming that the same usage was followed by the western Greeks and by the Italic tribes; but it is difficult to suppose that at a remote period, before the importation of papyrus, such an obviously convenient writing material as skin was not used among the early civilized races of Greece and Italy.

The method of preparation of skins for the service of literature in those distant ages is unknown to us; but it may be assumed that it was more or less imperfect, and that the material was rather of the character of tanned leather than of the thinner and better prepared substance which was to follow in later time. The preparation of the manufacture to which we refer was to be of a nature so thorough as to endow the material with a new name destined to last down to the present day.

The new manufacture was traditionally attributed to Eumenes II. of Pergamum, 197—183 B.C. The common story, as told by Pliny on the authority of Varro, is that Eumenes, when seeking to enlarge the library of his capital, was opposed by the jealousy of the Ptolemies, who forbade the export of papyrus from Egypt, thus hoping to check the growth of the rival library; and that the Pergamene king was thus compelled to revert to the old custom of using skins as writing material. It is needless to regard this story as literally true, or as other than a popular explanation of a great development of the manufacture of skin material for books in the reign of Eumenes. In former times the prepared skins had been known by the natural titles διοδήμας, μεθωκάρις, the Latin membranae, and these were at first also attached to the new manufacture; but the latter soon received a special name after the place of its origin, and became known as papyrus, chara pergamina, from which descends the English term parchment, through the French parchemin. The title of pergamentum actually appears first in the edict of De pretiis rerum of DIOCLETIAN (A.D. 301), and in a passage in one of St Jerome's Epistles.

The principal improvement in the new manufacture was the dressing of the skins in such a way as to render them capable of receiving writing on both sides, the older methods probably treating only one side for the purpose, a practice which was sufficient in times when the roll was the ordinary form of book
and when it was not customary to write on the back as well as on the face of the material. The invention of parchment with its two surfaces, recto and verso, equally available for the scribe, ensured the development of the codex. (See Manuscript.)

The animals whose skins were found appropriate for the manufacture of the new parchment were chiefly sheep, goats and calves. But in course of time there has arisen a distinction between the coarser and finer qualities of the material; and, while parchment made from ordinary skins of sheep and goats continued to bear the name, the finer kinds of manufacture produced from the more delicate skins of the calf or kid, or of still-born or newly-born, calves or lambs, came to be generally known as vellum (Fr. velin).

The skin codices of the early and middle ages being for the most part composed of the finer kinds of material, it has become the custom to describe them as of vellum, although in some instances it would be more correct to call the material parchment.

The ordinary modern process of preparing the skins is by washing, liming, unhairing, scraping, washing a second time, stretching evenly on a frame, scraping a second time and paring down inequalities, dusting with sifted chalk and rubbing with pumice. Somewhat similar methods, no doubt varying in details, must have been employed from the first.

The most convenient and medieval MSS. that have survived enable us to gather some knowledge of the varieties of the material in different periods and in different countries. We know from references in Roman authors that parchment or vellum was entering into competition with papyrus as a writing material at least as early as the 2nd century of our era (see Manuscript), though at that time it was probably not so skillfully prepared as to be a dangerous rival. But the surviving examples of the 3rd and 4th centuries show that a rapid improvement must almost at once have been effected, for the vellum of that age is generally of a thin and delicate texture, firm and crisp, with a smooth and glossy surface. Here it should be noticed that there was always, and in some periods and in some countries more than in others, a difference in colour between the surface of the skin from which the hair had been removed and the inner surface next to the flesh of the animal, the latter being whiter than the other. This difference is generally more noticeable in the older examples, those of a later period having usually been treated more thoroughly with chalk and pumice.

To the same룩, however, belong those vellums which, when making up the quires for a volume, to lay hair-side next to hair-side and flesh-side to flesh-side, so that, at whatever place the codex was opened, the tint of the open pages should be uniform.

As a rule, the vellum of early MSS., down to and including the 6th century, is of good quality and well prepared. After this, the demand increasing, a greater amount of inferior material came into the market. The manufacture necessarily varied in different countries. In Ireland and England the vellum of the early MSS. is usually of stouter quality than that of foreign examples. In Italy and Greece and in the European countries generally bordering on the Mediterranean, a highly polished surface came into favour in the middle ages, with the ill effect that the hardness of the material resisted absorption, and that there was always a tendency for ink and paint to flake off. On the other hand, in western Europe a soft pliant vellum was in vogue for the better classes of MSS. from the 12th century onwards. In the period of the Italian Renaissance a material of extraordinary smoothness and purity was affected.

Examples of uterine vellum, prepared from still-born or newly-born young, are met with in choice volumes. A remarkable instance of a codex composed of this delicate substance is the Additional MS. 51935, of the 13th and 14th centuries, in the British Museum, which is made up of as many as 579 leaves, without being a volume of abnormal bulk.

In conclusion, we must briefly notice the employment of vellum of a summptuous character to add splendour to specially choice codices of the early middle ages. The art of dyeing the material with a rich purple colour was practised both in Constantinople and in Rome; and, at least as far back as the 3rd century, MSS., generally of the Scriptures, were produced written in silver and gold on the precious stained vellum: a useless luxury, denounced by St Jerome in a well-known passage in his preface to the Book of Job. A certain number of early examples still survive, in a more or less perfect condition: such as the MS. of the Gospels in the Old Latin version at Verona, of the 4th or 5th century; the celebrated codex of Genesis in the Imperial Library at Vienna; the Rossano MS. and the Patmos MS. of the Gospels in Greek; the Gothic Gospels of Ulphias at Upsala, and others, of the 6th century, besides a few somewhat later specimens. In the revival of learning under Charlemagne a further encouragement was given to the production of such codices; but soon afterwards the art of purple-staining appears to have been lost or abandoned. A last trace of it is found in a few isolated instances of stained vellum leaves inserted for ornament in MSS. of the period of the Renaissance.

 Authorities.—Particulars of the early manufacture and use of parchment and vellum are to be found in most of the handbooks on palaeography and book-development, such as W. Wattenbach, Das Schriftums im Mittelalter (3rd ed., 1896); G. Birt, Das antike Buchwesen (1882); Sir E. M. Thompson, Handbook of Greek and Latin Palaeography (3rd ed., 1906). See also La Lande, Art de faire le parchemin (1762); G. Peignot, Essai sur l'histoire du parchemin et du vair (1812); A. Watt, The Art of Leather Manufacture (E. M. T.).

PARCLOSE.—PARDOLLARE, a close thoroughly; Lat. claudere, an architectural term for a screen or railing used to enclose a chantry, tomb, chapel, &c., in a church, and for the space thus enclosed.

PARDAILLAN, the name of an old French family of Armagnac, of which several members distinguished themselves in the service of the kings of France in the 16th and 17th centuries. Antoine Arnaud de Pardaillan, maréchal de camp, served Henry IV. in Franche-Comté, Picardy and Savoy, and was created marquis of Montespans in 1612 and marquis d'Antin in 1615 under Louis XIII. His grandson Louis Henri, marquis de Montespans, was the husband of Mme de Montespans, the mistress of Louis XIV. Louis Antoine de Pardaillan de Gondrin (1665–1736), legitimate son of the famous marquis, became lieutenant-general of the armies of the king in 1702, governor of the Orléanais, director-general of buildings in 1708, lieutenant-general in Alsace, member of the council of regency, and minister of war. He was named duc d'Antin in 1717. The last duc d'Antin, Louis, died in 1757.

PARDÈSSUS, JEAN MARIE (1772–1839), French lawyer, was born at Blois on the 11th of August 1772. He was educated by the Oratorians, and then studied law, at first under his father, a lawyer at the Présidial, who was a pupil of Robert J. Pothier. In 1796, after the Terror, he married, but his wife died at the end of three years. He was thus a widower at the age of twenty-seven, but refused to remarry and so give his children a step-mother. He wrote a Traité des servitudes (1806), which went through eight editions, then a Traité du contrat et des lettres de change (1809), which pointed him out as fitted for the chair of commercial law recently formed at the faculty of law at Paris. The emperor, however, had insisted that the position should be open to competition. Pardessus entered (1810) and was successful over two other candidates, André M. J. J. Dupin and Persil, who afterwards became brilliant lawyers. His lectures were published under the title Cours de droit commercial (4 vols., 1813–1817). In 1815 Pardessus was elected to the department of Loir-et-Cher, and from 1826 to 1830 was constantly re-elected; then, however, he no longer sought re-election, and to take the oath of allegiance to Louis Philippe, and was deprived of his office. After the publication of the first volume of his Collection des lois maritimes antérieures au xviith siècle (1828) he was elected a member of the Académie des Inscriptions et Belles Lettres. He continued his collection of maritime laws (4 vols., 1828–1845), and published Les Us et coutumes de la mer (2 vols., 1847). He also brought out two volumes of Merovingian diplomas (Diplomata, chartae, epistolae, leges, 1843–1849); vols. iv.—vi. of the Table chronologique des diplomes; and
PARDO BAZÁN, EMILIA (1837-1887), Spanish author, was born at Coruña, Spain, on the 16th of September 1851. Married in her eighteenth year to Sr D. José Quiroga, a Galician country gentleman, she interested herself in politics, and is believed to have taken an active part in the subterranean campaign against Amadeo of Savoy and, later, against the republic. In 1876 she came into notice as the successful competitor for a literary prize offered by the municipality of Oviedo, the subject of her essay being the Benedictine monk, Benito Jerónimo Feijoo. This was followed by a series of articles inserted in La Ciencia cristiana, a magazine of the purest orthodoxy, edited by Juan M. Ortí y Lara. Her first novel, Pascual López (1879), is a simple exercise in fantasy of no remarkable promise, though it contains good descriptive passages of the romantic type. It was followed by a more striking story, Un Viaje de novios (1881), in which a discreet attempt was made to introduce into Spain the methods of French realism. The book caused a sensation among the literary cliques, and the success was increased by the insertion of another naturalistic tale, La Tribuna (1882), wherein the influence of Zola is unmistakable. Meanwhile, the writer's reply to her critics was issued under the title of La Cuestión polípilota (1883), a clever piece of rhetoric, but of no special value as regards criticism or dialectics. The naturalistic scenes of El Cisne de Villamor (1885) are more numerous, more pronounced, than in any of its predecessors, though the author eschews the logical application of her theories by supplying a romantic and inappropriate ending. Probably the best of Srá Pardo Bazán's work is embodied in Los Pasos de Ulloa (1886), the painfully exact history of a decaying aristocratic family, as notable for its portraits of types like Nucha and Julián as for its creation of characters like those of the political braves, Barbará and Trampeta. Yet perhaps its most abiding merit lies in its pictures of country life, its poetic realization of Galician scenery set down in an elaborate, highly-coloured style, which, if not always academically correct, is invariably effective. A sequel with the significant title of La Madre naturalista (1887), marks a further advance in the path of naturalism, and henceforward Sra Pardo Bazán was universally recognized as one of the chief figures of the new naturalistic movement in Spain. The title was confirmed by the publication of Insolución y Morriña, both issued in 1889. In this year her reputation as a novelist reached its highest point. Her later stories, La Cristiana (1890), Cuentos de amor (1894), Arco Iris (1895), Misterio (1903) and La Quimera (1902), though not wanting in charm, awaken less interest. In 1903 she published a play entitled Verdad, remarkable for its boldness rather than for its dramatic qualities.

PARDOE, JULIA (1806-1862), English writer, was born at Beverley, Yorkshire, in 1806. When fourteen years old she published a volume of poems. In 1835 she went to Constantinople and her experiences there furnished her with material for vivid pictures of Eastern life in the City of the Sultan (1837), Romance of the Harem (1839) and Beauties of the Bosphorus (1830). Her other works, not always historically accurate, include Louis XIV. and the Court of France in the Seventeenth Century (1847); The Council and Reign of Francis I (1849); The Life and Memoirs of Marie de Medicis (1852); Episodes of French History during the Consulate and the First Empire (1859); and several sprightly and pleasant novels. In 1860 she was granted a civil list pension. She died on the 26th of November 1862.

PARDON (through the Fr. from Late Lat. perdona, to remit a debt or other obligation on a penalty), the remission, by the power entrusted with the execution of the laws, of the penalty attached to a crime. The right of pardoning is coextensive with the right of punishing. In a perfect legal system, says Beccaria, pardons should be excluded, for the clemency of the prince seems a tacit disapprobation of the laws (Dei Delitti e delle pene, ch. xx.). In practice the prerogative is extremely valuable, when used with discretion, as a means of adjusting the different degrees of moral guilt in crimes or of rectifying a miscarriage of justice. By the law of England pardon is the sole prerogative of the king, and it is declared by 27 Hen. VIII. c. 24 that no other person has power to pardon or remit any treasons or felonies whatsoever. This position follows logically from the theory of English law that all offences are breaches of the king's peace. Indictments still conclude with a statement that the offence was committed "against the peace of our lord king, his crown and dignity." The Crown by pardon only remits the penalty for an attack upon itself. The prerogative is in modern times exercised by delegation, the Crown acting upon the representation of the secretary of state for the home department in Great Britain, or of the lord lieutenant in Ireland. The prerogative of the Crown is subject to some restrictions: (1) The committing of a subject of the realm to a prison out of the realm is by the Habeas Corpus Act a praemunire, unpardonable even by the king (31 Car. II. c. 2, § 12). (2) The king cannot remit punishment of a nature more than indicative of a private wrong, so as to prejudice the person injured by the offence. Thus a common nuisance cannot be pardoned while it remains unredressed, or so as to prevent an abatement of it. A fine or penalty imposed for the offence may, however, be remitted. By an act of 1850 (22 Vict. c. 32) his majesty is enabled to remit wholly or in part any sum of money imposed upon conviction, and, if the offender has been imprisoned in default of payment, to extend to him the royal mercy. There are other statutes dealing with special offences, e.g. by the Remission of Penalties Act 1875 his majesty may remit any penalty imposed under 21 Geo. III. c. 40 (an act for preventing certain abuses and profanations on the Lord's Day called Sunday). (3) The king's pardon cannot be pleaded in bar of an impeachment. This principle, first asserted by a resolution of the House of Commons in the earl of Danby's case (May 5, 1679), forms one of the provisions of the Act of Settlement, 12 & 13 Will. III. c. 2. It is there enacted "that no pardon under the great seal of England shall be pleaded to an impeachment by the Commons in parliament," § 3. This provision does not extend to abridging the prerogative after the impeachment has been heard and determined. Thus three of the rebel lords were pardoned after impeachment and attainted in 1715. (4) In the case of treason, murder or rape a pardon is ineffectual unless the offence be particularly specified therein (13 Rich. II. c. 1, § 2). Before the Bill of Rights, 1 Will. & M. c. 2, § 2, this statute seems to have been frequently evaded by a non obstante clause. But, since by the Bill of Rights no dispensation by non obstante is allowed, general words contrary to the statute of Richard II. would seem to be ineffectual. Pardon may be actual or constructive. Actual pardon is by warrant under the great seal, or under the sign-manual countersigned by a secretary of state (7 & 8 Geo. IV. c. 28, § 3). Constructive pardon is obtained by endurance of the punishment. By 9 Geo. IV. c. 32, § 3, the endurance of a punishment on conviction of a felony not capital has the same effect as a pardon under the great seal. This principle is reaffirmed in the Larceny Act 1861, § 109, and in the Malicious Injuries to Property Act 1861, § 9. Further, pardon may be free orconditional. Aconditional pardon most commonly occurs where an offender sentenced to death has his sentence commuted to penal servitude or any less punishment. The condition of his pardon is the endurance by him of the substituted punishment. The effect of pardon, whether actual or constructive, is to put the person pardoned in the position of an innocent man, so that he may have
an action against any one thenceforth calling him traitor or felon. He cannot refuse to give evidence respecting the offence pardoned on the ground that his answer would tend to criminate him. A pardon may be pleaded on arraignment in bar of an indictment (though not of an impeachment), or after verdict in arrest of judgment. No doubt it would generally be advantageous to plead it as early as possible.

It is obvious that, though the Crown is invested with the right to pardon, this does not prevent pardon being granted by the higher authority of an act of parliament. Acts of indemnity have frequently been passed, the effect of which is the same as pardon or remission by the Crown. Examples of acts of indemnity are two private acts passed in 1880 to relieve Lords Byron and Plunket from the disabilities and penalties to which they were liable for sitting and voting in the House of Peers without taking the oath.

Civil rights are not divested by pardon. The person injured may have a right of action against the offender in spite of the pardon of the latter, if the right of action has once vested, for the Crown cannot affect private rights. In Scotland this civil right is specially preserved by various statutes. Thus 1503, c. 174, provides that, if any respite or remission happen to be granted before the party grieved be first satisfied, the same is to be null and of no avail. The assytement, or indemnification due to the heirs of the person murdered from the murderer, is due if the murderer has received pardon, though not if he has suffered the penalty of the law. The pardon transmitted by the secretary of state is applied by the supreme court, who grant the necessary orders to the magistrates in whose custody the convict is.

In the United States the president is empowered to pardon offences against the United States, except in cases of impeachments (U.S. Constitution, art. II, § 2). The power of pardon is also vested in the executive authority of the different states, with or without the concurrence of the legislative authority, although in some states there are boards of pardon of which the governor is a member ex officio. Thus by the New York Code of Criminal Procedure the governor of the state of New York has power to grant reprieves, commutations and pardons, except in the case of treason, where he can only suspend the execution of the sentence until the case can be reported to the legislature, with whom the power of pardon in this case rests. The usual form of pardon in the United States is by deed under seal of the executive.

PARDUBITZ (Czech, Pardubice), a town of Bohemia, Austria, 69 m. E. of Prague by rail. Pop. (1900), 17,026, mostly Czech. The most interesting buildings are the old fortified chateau of the 16th century, with its Gothic chapel restored in 1880; the church of St Bartholomew, dating in its present form from 1538; the new town hall (1894); the Grunes Tor, also built in 1338; and the handsome new synagogue. Pardubitz has a tolerably active trade in grain and timber, and the horse-fairs attract curiosity.

PARÉ, AMBROISE (1510-1590), French surgeon, was born at Laval, in the province of Maine, and died at Paris in 1590. His professional career and services to his art are described in the article SURGERY. A collection of his works was published at Paris in 1575 and they were afterwards frequently reprinted. Several editions have appeared in German and Dutch, and among the English translations was that of Thomas Johnson (1663).

See J. F. Malgaigne, Oeuvres complètes (Paris, 1830); Le Paulmier, Ambroise Paré d'après de nouveaux documents découverts aux archives nationales et de papiers de famille (Paris, 1883); Stephen Paget, Ambroise Paré and his Times (London, 1897).

PAREJA, JUAN DE (1606-1670), Spanish painter, was born a slave in the West Indies about 1606, and in early life passed into the service of Velazquez, who employed him in colour-grinding and other menial work of the studio. Each day he closely watched his master's methods, and by night stealthily practised with his brushes until he had attained considerable manipulative skill. The story goes that, having succeeded in producing a picture satisfactory to himself, he contrived furtively to place it among those on which Velazquez had been working, immediately before an expected visit of King Philip IV. The performance was duly discovered and praised, and Pareja forthwith received his freedom, which, however, he continued to devote to his former employer's service. His extant works are not very numerous; the best known, the "Calling of St Matthew," now in the Prado, Madrid, has considerable merit as regards technique, but does not reveal much originality, insight or devotional feeling. He died in 1670.

PARENT, SIMON NAPOLEON (1855— ), Canadian politician, son of Simon Polycarpe Parent, merchant, was born in the village of Beauport, in the province of Quebec, on the 12th of September 1855. He was educated at Laval University, where he graduated in 1881. In the same year he was called to the bar of the province of Quebec. He married in 1877 Marie Louise Clara Gendron, of Beauport. In 1890 Parent was elected a member of the municipal council of Quebec, and served as mayor of the city from 1894 to 1906. From the year 1890 to 1905 he represented the county of Saint-Sauveur as a Liberal in the legislative assembly of his native province, and on the formation of the Marchand administration in 1897 he accepted the portfolio of minister of lands, forests and fisheries. After Marchand's death in September 1900 he was called by the lieutenant-governor to form a cabinet, and continued in office as prime minister until his retirement from public life in August 1905. Parent proved a capable administrator of provincial and municipal affairs. Under his administration the finances of the city of Quebec were improved, an electric car service was provided, public parks were opened, a system of electric light was established and the streets were well paved. In 1905 he became chairman of the Transcontinental railway of Canada.

PARENTHESIS (from Gr. παρενθέσεως, put in alongside), the grammatical term denoting the insertion (and so also the signs for such insertion) of a word, phrase or sentence between other words or in another sentence, without interfering with the construction or the meaning of the surrounding text.

PARENTZ, a sea port of Austria, in Istria, 95 m. S. by W. of Trieste by rail. Pop. (1900), 9062, mostly Italian. It is situated on the west coast of Istria, and is built on a peninsula nowhere more than 5 ft. above the sea-level; and from the fact that the pavements of the Roman period are 3 ft. below the present surface it is inferred that this part of the coast is slowly subsiding. Parenz has considerable historic and architectural interest, and its well-preserved cathedral of St Maurus, erected probably between 335 and 543, is one of the most interesting buildings in the whole of Austria. The basilican type is very pure; there are three naves; the apse is hexagonal without and round within. The total length of the church proper is only 120 ft.; but in front of the choir is a square atrium with three arches on each side; to the west of the atrium is a now roofless baptistry, and to the west of that rises the campanile; so that the total length from campanile to apse is about 230 ft. Mosaics, now greatly spoiled, form the chief decoration of both outside and inside. The high altar is covered with a noble baldachin, dating from 1277. The basilica is one of those churches in which the priest when celebrating mass stands behind the altar with his face to the west. An older church is referred to in the inscription of Euphrasius in the mosaic of the apse of the cathedral, and remains of its mosaic pavement and of its apse have been found under the floor of the present church; it belongs perhaps to the 5th century A.D.; while at a still lower level another pavement, perhaps of the 4th century A.D., has been discovered, belonging to the first church, which lay to the north of the present. Several inscriptions mention the name of donors of parts of it. The mosaic pavement of the present church was almost entirely destroyed in 1880, when the floor-level was raised. Small portions of two temples and an inscribed stone are the only remains of the ancient Roman city that
PARGA—PARINI

readily catch the eye. Parenzo is the seat of the Provincial Diet of Istria, and is also an episcopal see.

Pareno (Lat. Parentium), conquered by the Romans in 173 B.C., was made a colony probably by Augustus after the battle of Actium, for its title in inscriptions is Colonia Julia and not, as it has often been given, Colonia Ulpia. It grew to be a place of some note with about 6000 inhabitants within its walls and 10,000 in its suburbs. The bishopric, founded in 424, gradually acquired ecclesiastical authority over a large number of abbeys and other foundations in the surrounding country. The city, which had long been under the influence of Venice, formally recognized Venetian supremacy in 1267, and as a Venetian town it was in 1534 attacked and plundered by Paganino Doria of Genoa. The bishoprics of Pola and Parenzo were united in 1287.

See John Mason Neale, Notes on Dalmatia, Istria, &c. (London, 1861), with ground plan of cathedral; E. A. Freeman, Sketches from the Subject and Neighbour Lands of Venice (London, 1881); and Neumann, Der Dom von Parenzo (Vienna, 1902).

PARGA, a seaport of Albania, European Turkey, in the vilayet of Iannina, and on the Ionian Sea. Pop. (1903), about 3000, of whom the majority are Greeks. Parga has a rock-built citadel and a harbour formed by a mole which the Venetians constructed in 1572. It exports olive oil, wool, hides, and skins. On the site of the ruins of the ancient Troy (or Palaio-Parga), a short distance to the west, Parga was removed to its present position after the Turkish invasion in the 15th century. Under Venetian protection, freely accepted in 1401, the inhabitants maintained their municipal independence and commercial prosperity down to the destruction of the Venetian republic in 1797, though on two occasions, in 1500 and 1560, their city was burned by the Turks. The attempts of Ali Pasha of Iannina to make himself master of the place were thwarted partly by the presence of a French garrison in the citadel and partly by the heroic attitude of the Pargiotes themselves, who were anxious to have their city incorporated with the Ionian Republic. To secure their purpose they in 1814 expelled the French garrison and accepted British protection; but the British Government in 1815 determined to go back to the convention of 1800 by which Parga was to be surrendered to Turkey, though its mosque was to be built or Mussulman to settle within its territory. Rather than subject themselves to the tyranny of Ali Pasha, the Pargiotes decided to forsake their country; and accordingly in 1819, having previously armed and provided the remnant of their ancestors, they migrated to the Ionian Islands. The Turkish government was constrained to pay them £142,425 by way of compensation.

PARGETTING (from O. Fr. pargeret or parjeret; par, all over, and jeter, to throw, i.e. "rough cast"); other derivations suggested have been from Lat. spargere, to sprinkle, and from paries, a wall, the last due to writing the pariet in the form pariet), a term applied to the decoration in relief of the plastering between thestudwork on the outside of half-timber houses, or sometimes covering the whole wall. The devices were stamped on the wet plaster. This seems generally to have been done by sticking a number of pins in a board in certain lines or curves, and then pressing on the wet plaster in various directions, so as to form geometrical figures. Sometimes these devices are in relief, and in the time of Elizabeth represent figures, birds, foliage, &c.; fine examples are to be seen at Ipswich, Maidstone, Newark, &c. (See PiaSter-woRK.) The term is also applied to the lining of the inside of smoke flues to form an even surface for the passage of the smoke.

PARIAN CHRONICLE (Comicon or Marmor Parium), a marble tablet found in the island of Paros in 1627, now among the Arundel Marbles at Oxford. It originally embraced an outline of Greek history from the reign of Cercopis, legendary king of Athens, down to the archonsip of Diogenetus at Athens (267 B.C.). The Chronicle seems to have been set up by a private person, but, as the opening of the inscription has perished, we do not know the occasion or motives which prompted the step. The author of the Chronicle has given much attention to the festivals, and to poetry and music; thus he has recorded the dates of the establishment of festivals, of the introduction of various kinds of poetry, the births and deaths of the poets, and their victories in contests of poetical skill. On the other hand, important political and military events are often entirely omitted; thus the return of the Heraclidae, Lycurgus, the wars of Messene, Draco, Solon, Cleisthenes, Peicles, the Peloponnesian War and the Thirty Tyrants are not even mentioned. The years are reckoned backwards from the archonsip of Diogenetus, and the dates are further specified by the kings and archons of Athens. The reckoning by Olympiads has been employed. The chronicle consists of 93 lines, written chiefly in the Attic dialect.

PARINI, GIUSEPPE (1729-1799), Italian poet, was born at Bosio in the Milanese, on the 22nd of May 1729. His parents, who possessed a small farm on the shore of Lake Pusiano, sent him to Milan, where he studied under the Barnabites in the Academy Arcimboldi, maintaining himself latterly by copying manuscripts. In 1752 he published at Lugano, under the pseudonym of Rinaldo Malipini, a small volume of scolio versi, which secured his election to the Accademia dei Trasformati at Milan and to that of the Arcadi at Rome. His poem, Il Malino, which was published in 1753, and which marked a distinct advance in Italian blank verse, consisted of ironical instructions to a young nobleman as to the best method of spending his mornings. It at once established Parini's popularity and influence, and two years later a continuation of the same theme was published under the title of Il Mewogirno. The Austrian plenipotentiary, Count Firmian, interested himself in procuring the poet's advancement, appointing him in the
PARIS—PARIS, F. DE

803

first place, editor of the Milan Gazette, and in 1769, in despite of the Jesuits, to a specially created chair of belles lettres in the Palatine School. On the establishment of the French Republic in 1801, he was appointed maître des requêtes by Napoleon and Saliceti, but almost immediately retired to resume his literary work and to complete Il Vespro and La Notte (published after his death), which with the two other poems already mentioned compose what is collectively entitled Il Giorno. Among his other poems is his rather artificial Odi, composed between 1757 and 1795, have appeared in various editions. He died on the 1st of August 1799.

His works, edited by Reina, were published in 6 vols. 8vo (Milan, 1801-1804); and an excellent critical edition by G. Mazzoni appeared at Florence in 1897.

PARIS (also called ALEXANDROS), in Greek legend, the son of Priam, king of Troy and Hecuba. Before he was born his mother dreamed that she was delivered of a firebrand. The dream was interpreted that her child would ruin his country, and when Paris was born he was exposed on Mt Idâ. His life was saved by the herdsman, and grown to manhood he distinguished for beauty and strength, till he was recognized and received in his parents. He is said to have been called Alexandros from his bravery in defending the herds against raids. When the strife arose at the marriage of Peleus and Thetis between Hera, Athena and Aphrodite, each claiming the apple that should belong to the most beautiful, Paris was selected as the judge. The three rivals unveiled their divine charms before a mortal judge on Mt Idâ. Each tried to bribe the judge, Hera by promising power, Athena wisdom, Aphrodite the most beautiful woman in the world. Paris decided in favour of Aphrodite, and made Hera and Athena bitter enemies of his country (Homer, Iliad, xxiv. 25; Euripides, Troades, 925; Andromache, 284; Helena, 23). To gain the woman whom Aphrodite had promised, Paris set sail for Lacedaemon, deserting his old love Oenone, daughter of the river-god Cebren, who in vain warned him of the consequences. He was hospitably received by Menelaus, whose kindness he repaid by persuading his wife Helen to flee with him to Troy (Iliad, vi. 290). The siege of Troy by the united Greeks followed. Paris proved a lazy and backward fighter, though not wanting in actual courage when he could be roused to exert himself. Before the capture of the city he was mortally wounded by Philoctetes with an arrow (Sophocles, Philoctetes, 1426). He then betook himself of the slighted nymph Oenone, who knew she could heal the wound. He was carried into her presence, but she refused to save him. Afterwards, when she found he was dead, she committed suicide (Apollodorus iii. 12). The judgment of Paris became a favourite subject in Greek art. Paris is represented as a beautiful young man, beardless, wearing the pointed Phrygian cap, and often holding the apple in his hand.

PARIS, ALEXIS PAULIN (1800-1881), French savant, was born at Avenay (Marne) on the 25th of March 1800. He published in 1824 an Apologie pour l’Ecole romantique and took an active part in the French journal le Journal de l’Ecole. His appointment, in 1828, to the department of manuscripts in the Bibliothèque royale left him leisure to pursue his studies in medieval French literature. Paulin Paris lived before minute methods of research had been generally applied to modern literature, and his chief merit is that by his numerous editions of early French poems he continued the work begun by Dominique Ménon in arousing general interest in the then little-known epics of chivalry. Admitted to the Académie des Inscriptions et Belles Lettres in 1837, he was shortly afterwards appointed on the commission entrusted with the continuation of the Histoire de la France. In 1853 a chair of medieval literature was founded at the Collège de France, and Paulin Paris became the first occupant. He retired in 1872 with the title of honorary professor, and was promoted officer of the Legion of Honour in the next year. He died on the 12th of February 1881 in Paris.

His works include: Manuscript français de la bibliothèque du roi (7 vols, 1836-1848); Le Romans de Gervin le Lohrian, précédé d’un examen des romans carolingiens (1839-1848); Le Romans de Gervin le Lohrian aux grains pêles (1852); Le Roman de Renart, histoire de quelques ancients trouvères et chansons de leurs chansons (1833); an edition of the Grandes chroniques de France (1836-1840); La Chanson d’Antioche (1848); Les Aventures de maître Renart et d’Ysengrin (1861) and Les Romains de la table ronde (1866-1877), both put into modern French.

His son Gaston Paris contributed a biographical notice to vol. xxii. of the Histoire littéraire.

PARIS, BRUNO PAULIN GASTON (1839-1903), French scholar, son of Paulin Paris, was born at Avenay (Marne) on the 9th of August 1839. In his childhood Gaston Paris learned to appreciate the Old French romances as poems and stories, and this early impulse to the study of Romance literature was placed on a solid basis by courses of study at Bonn (1856-1857) under Friedrich Diez, at Göttingen (1857-1858) and finally at the École des Chartes (1858-1861). His first important work was an Étude sur le rôle de l’accent latin dans la langue française (1861). The subject was developed later in his Lettre à M. Élie Gauthier sur la versification latine rhymatique (1866). Gaston Paris maintained that French versification was a natural development of popular Latin methods which depended on accent rather than quantity, and were as widely different from classical rules as the Low Latin was from the classical idiom. For his degree as doctor he presented a thesis on the Histoire poétique de Chartamagne (1865). He succeeded his father as professor of medieval French literature at the Collège de France in 1872; in 1876 he was admitted to the Academy of Inscriptions and in 1886 to the French Academy; and in 1895 he was appointed director of the Collège de France. Gaston Paris won a European reputation as a Romance scholar. He had learnt German methods of exact research, but besides being an accurate philologist he was a literary critic of great acumen and breadth of view, and brought a singularly clear mind to bear on his favourite study of medieval French literature. His Vie de Saint-Alexis (1872) broke new ground and provided a model for future editors of medieval texts. It included the original text and the variations of it dating from the 13th, 14th and 14th centuries. Gaston Paris contributed largely to the Histoire de la France, and with Paul Meyer published Romania, a journal devoted to the study of Romance literature. Among his other numerous works may be mentioned Les Plus anciens monuments de la langue française (1875); a Manuel d’ancien Français (1888); an edition of the Mystère de la passion d’Arnoul Creban (1878), in collaboration with M. Gaston Raynaud; Deux rédactions du roman des sept sages of Rome (1876); a translation of the Grammaire des langues romanes (1874-1878) of Friedrich Diez, in collaboration with MM. Brachet and Morel-Fatio. Among his works of a more popular nature are La Poésie du moyen âge (1885 and 1895); Penseurs et poètes (1897); Poèmes et légendes du moyen âge (1900); François Villon (1901), an admirable monograph contributed to the “Grands Écrivains Français” series; Légendes du moyen âge (1903). His excellent summary of medieval French literature forms a volume of the Temple de la littérature. Gaston Paris contributed largely to the wide circle of scholars outside his own country by his unfailing urbanity and generosity. In France itself he trained at the École des Chartes and the Collège de France a band of disciples who continued the traditions of exact research that he established. Among them were: Léopold Pannier; Marius Sepet, the author of Le Drame chrétien au moyen âge (1878) and of the Origines catholiques du théâtre moderne (1901); Charles Joret; Alfred Morel-Fatio; Gaston Raynaud, who is responsible for various volumes of the excellent editions published by the Société des anciens textes français; Arène Darmesteter and others. Gaston Paris died in Paris on the 6th of March 1903.

See "Hommage à Gaston Paris " (1903), the opening lecture of his successor, Joseph Bédier, in the chair of medieval literature at the Collège de France; A. de Thomason, Essais de philologie française (1897); W. P. Ker, in the Fortnightly Review (July, 1904); M. Croiset, Notice sur Gaston Paris (1904); J. Bédier and M. Roques, Bibliographie des travaux de Gaston Paris (1904).

PARIS, FRANÇOIS DE (1600-1727), French theologian, was born in Paris on the 3rd of June 1600. He zealously opposed the bull Unigenitus (1713), which condemned P. Quesnel's
PARIS, COMTE DE—PARIS

annotated translation of the Bible. He gave further support to the Jansenists, and when he died (May 1, 1727) his grave in the cemetery of St Médard became a place of fanatical pilgrimage and wonder-working. The king ordered the churchyard to be closed in 1732, but earth which had been taken from the grave proved equally efficacious and helped to encourage the disorder which marked the close of the Jansenist struggle (see Jansenism).

PARIS, LOUIS PHILIPPE ALBERT D'ORLÉANS, COMTE DE (1838–1894), son of the duc d'Orléans, the eldest son of King Louis Philippe, was born on the 24th of August 1838. His mother was the princess Helen of Mecklenburg-Schwerin, a Protestant. By the death of his father through a carriage accident in 1842, the count, who was then only four years of age, became heir-apparent to the French throne. On the deposition of Louis Philippe in 1848, the duchess of Orléans struggled to secure the succession to her son, and bore him through an excited populace to the chamber of deputies. The chamber itself was soon invaded, however, and the Republic proclaimed. The princes were driven from the Saint-Just, and the duke was indemnified with her two sons, the comte de Paris and the duc de Chartres, first to Eisebach in Saxony, and then to Claremont in Surrey. After his mother's death in 1858 the count made a long foreign tour. In 1861 he and his brother accompanied their uncle, the prince de Joinville, to the United States. The brothers were attached to the staff of General McClellan, commanding the "Army of the Potomac." In April 1862 the count took part in the siege of Yorktown, and was present at the action of Williamsburg on the 5th of May. He was also with McClellan at the battle of Fair Oaks, and was personally engaged in the sanguinary battle at Gaines Mill on the 27th of June. When difficulties arose between France and the United States with regard to the affairs of Mexico, the Orléans princes withdrew from the American army and returned to Europe. During the winter of 1862–1863 the count took a special interest in the organization of the Lancashire Cotton Famine Fund, and contributed an article to the Revue des deux mondes entitled "Christmas Week in Lancashire." On the 30th of May 1864 he married his cousin, the princess Marie Isabelle, daughter of the duc de Montpensier; and his son and heir, the duc d'Orléans, was born at York House, Twickenham, in 1864. The count was refused permission to serve in the Franco-Prussian War, but after the fall of Napoleon III. he returned to France. Abstaining from putting himself forward, he lived quietly on his estates, which had been restored to him by a vote of the Assembly. In August 1873 there was an important political conference at Frohsdorf, the result of which was that a fusion was effected, by which the comte de Paris agreed to waive his claims to the throne in favour of those of the comte de Chambord. By the death of the latter in 1883 the count became undisputed head of the house of Bourbon; but he did not show any disposition to press his claims. The popularity of the Orléans family, however, was shown on the occasion of the marriage of the comte de Paris's eldest daughter with the duke of Braganza, son of the king of Portugal, in May 1866. This so alarmed the French Conservative party that it led to new laws for the exclusion of foreign claimants to the French throne and their heirs were banished from France (June 11, 1886). The comte de Paris again retired to England, taking up his abode at Sheen House, near Richmond Park. Here he devoted his leisure to his favourite studies. In addition to his work Les Associations ouvrières en Angleterre, which was published in 1869 and translated into English, the count edited the letters of his father, and published at intervals in eight volumes his Histoire de la guerre civile en Amérique. In his later years the count seriously compromised the prospects of the Royalist party by the relations into which he entered with General Boulanger. He died on the 8th of September 1894.

PARIS, the capital of France and the department of Seine, situated on both banks of the Seine, 233 m. from its mouth and 285 m. S.S.E. of London by rail and steamer via Dover and Calais, in 48° 50′ 14″ N., 2° 20′ 14″ E. (observatory). It occupies the centre of the so-called Paris basin, which is traversed by the Seine from south-east to north-west, open towards the west, and surrounded by a chain of Jurassic heights. The greater part of the substratum is covered by Jurassic, Cretaceous and Tertiary formations; and at several points building materials—freestone, limestone or gypseum—have been laid bare by erosion. It is partly, indeed, to the existence of such quarries in its neighbourhood, and to the vicinity of the grain-bearing regions of the Beauce and Brie that the city owes its development. Still more important is its position at the meeting-place of the great natural highways leading from the Mediterranean to the ocean by way of the Rhone valley and from Spain northwards over the lowlands of western France. The altitude of Paris varies between 80 ft. (at the Point du Jour, the exit of the Seine from the fortifications) and 420 ft. at the hill of Montmartre in the north of the city; the other chief eminence is the hill of St Geneviève, on the left bank. Since 1840 Paris has been completely surrounded by a wall, which since 1862 has served also as the limit for the collection of municipal customs dues (octrois).

Proposals are constantly being brought forward to demolish this 19th century wall, by a broad and deep ditch—either entirely or at least from the Seine to the Jour—and where the Seine intersects the wall below the city, to Pantin, so as to extend the limits of the city as far as the Seine, which runs almost parallel with the wall for that distance. Within the wall the area of the city is 10,279 acres; the river runs through it from east to west in a broad curve for a distance of nearly 8 m.

Climate.—Paris has a fairly uniform climate. The mean temperature, calculated from observations extending over fifty years (1841–1890), is 49° 8 F. The highest reading (observed in July 1874 and again in August 1881) was 91° 2 F. (1 July 1881). The monthly means for the 50 years 1841–1890 were: January 35° 9, February 38° 3, March 42° 3, April 49° 5, May 55° 6, June 61° 7, July 64° 6, August 63° 5, September 58° 2, October 49° 8, November 43° 2, December 39° 5. The mean temperature for the five years 1891–1895 was 52° 9.

It was infrequent in nearly its whole extent from Bercy to Auteuil in the winters of 1819–1820, 1829–1830, 1879–1880 and 1889–1890. Rain falls, on an average, on about 400 days a year, and varies in a year between 22 and 23 in. The prevailing winds are those from the south, south-west and west. The general character of the climate, somewhat continental in winter and oceanic in summer, has been more closely observed since the three years 1877–1878, at different heights on the Eiffel Tower, where the wind was observed. It was in 1889 to the old-established series of St M. de Montsouris.1 The observatory at the old church-tower St Jacques (16th century) in the centre of the city, and since 1896 a municipal establishment, is of special interest on account of the study made there of the transparency and purity of the air. There are barely 100 days in the year when the air is very clear. Generally the city is covered by floating mists, possibly 1500 ft. in thickness. During the prevalence of north-easterly winds the sky is most obscured, since on that side lies the greatest number of factories with smoking chimneys.

Defences.—Paris, described in a recent German account as the greatest fortress in the world, possesses three perfectly distinct rings of defences. The two inner, the enceinte and the Ville de Paris, are both检查—at a radius of 10 mi. are of the bastioned type; the French engineers of the Noizet school favoured; they were built in the time of Louis Philippe, and with very few additions sustained the siege of 1870–1871. The outer works, of more modern type, forming an entrenched camp which in area is rivalled only by the Antwerp system of defences, were built after the Franco-German War.

The enceinte ("the fortifications" of the guide-books) is of plain bastion trace, without ravelins but with a deep dry ditch (escarp, but not countercap revetted). It is nearly 22 m. in perimeter and has 93 bastions, 67 gates and 9 railway passages. The greater part of the enceinte has, however, been given up, and a larger one projected—as at Antwerp—by connecting up the old detached forts.

1 The observatories of the Tour St Jacques and of Montsouris belong to the municipality of Paris; that of St Maur depends on the Central Bureau of Meteorology, a national institution.
These forts, which endured the siege in 1870–71, have a perimeter of about 34 m. Each is designed as a miniature fortress with amble casemates and high cavaliers, the tenaille and ravelins, however, being as a rule omitted. On the north side there are three forts (connected by a plain parapet) around St Denis, one of these being arranged to control an inundation. Next, to the right, or eastward, comes Fort Aubervillers, which commands the approaches north of the wood of Bondy. These four works lie in relatively low ground. The eastern works are situated on higher ground (300–350 ft.), they consist of four forts and various small redoubts, and command the approaches from the great wood of Bondy. In low ground again at the narrowest point of the great loop of the Marne (near St Maur-les-Fosses) there are two redoubts connected by a parapet, and between the Seine and the Marne, in advance of their confluence, Fort Charenton. On the south side of the city, hardly more than a mile from the enceinte, is a row of forts,ivy, Bicêtre, Montrouge, Vanves and Issy, solidly constructed works in themselves but, as was shown in 1870, nearly useless for the defence of the city against rifled guns, as (with the exception of Bicêtre) they are overlooked by the plateau of Châtillon. On the west side of Paris is the famous fortress of Mont Valérien, standing 538 ft. above the Seine, and overlooking the town. This completes the catalogue of the inner fort-line. It is strengthened by two groups of works which were erected in "provisional" form during the siege, and afterwards reconstructed as permanent forts—Hauts-Bruyères on the plateau of Villejuif, 1 m. south of Fort Bicêtre, and the Châtillon fort and batteries which now prevent access to the celebrated plateau that overlooks Paris from a height of 600 ft., and of which the rear batteries sweep almost the whole of the ground between Bicêtre and Mont Valérien.

The new works are 11 m. from the Louvre and 8 from the enceinte. They form a circle of 75 m. circumference, and an army which attempted to invest Paris to-day would have to be at least 500,000 strong, irrespective of all field and covering forces. The actual defence of the works, apart from troops temporarily collected in the fortified area, would need some 170,000 men only.

The entrenched camp falls into three sections—the north, the east and the southwest. The forts (of the general 1874–75 French type, see FORTIFICATION AND SIEGECRAFT) have from 24 to 60 guns; the casemates 500 to 1200 men each, the redoubts, batteries and annexe-batteries generally 200 men and 6 guns. In the northern section a ridge crosses the northern extremity of the St German Argentueil loop of the Seine after the fashion of the armature of a horse-shoe magnet; on this ridge (about 560 ft.) is a group of works, named after the village of Cormelles, commanding the lower Seine, the Argentuelle peninsula and the lower ground towards the Oise. At an average distance of 5 m. from St Denis lie the works of the Montlignon-Domont position (about 600–670 ft.), which sweep all ground to the north, cross their fire with the Cormelles works, and deny the plateau of Montmorency-Méré-sur-Oise to an enemy. At Écouen, on an isolated hill, are a fort and a redoubt, and to the right near these Fort Stains and two batteries on the ceinture artillery. The important eastern section consists of the Vaucourts position, the salient of the whole fortress, which commands the countryside to the north as far as Dammartin and Claye, crosses its fire with Stains on the one hand and Villiers on the other, and itself lies on a steep hill at the outer edge of the forest of Bondy which allows free and concealed communication between the fort and the inner line of works. The Vaucourts works are armoured. Three miles to the right of Vaucourts is Fort Chelles, which bars the roads and railways of the Marne valley. On the other side of the Marne, on ground made historic by the events of 1870, are forts Villiers and Champigny, designed as a bridgehead to enable the defenders to assemble in front of the Marne. To the right of these is a fort near Boissy-St-Leger, and on the right of the whole section are the armoured works of the

Villeneuve-St-Georges position, which command the Seine and Yères country as far as Brie and Corbeil. The left of the south-western section is formed by the powerful Fort Palaisau and its annexe-batteries, which command and overlook the Yvette valley. Behind Fort Palaisau, midway between it and Fort Châtillon, is the Verrières group, overlooking the valley of the Bièvre. To the right of Palaisau on the high ground towards Versailles are other works, and around Versailles itself is a semi-circle of batteries right and left of the armoured Fort St Cyr. In various positions around Marly there are some seven or eight batteries.

Topography.—The development of Paris can be traced onwards in approximately concentric rings from the Gallo-Roman town on the Île de la Cité to the fortifications which now form its boundary. A line of boulevards known as the Grands Boulevards, coinciding in great part with ramparts of the 14th, 16th and 17th centuries, encloses most of old Paris, a portion of which extends southwards beyond the Boulevard St Germain. Outside the Grands Boulevards lie the faubourgs or old suburbs, round which runs another enceinte of boulevards—boulevards extérieurs—corresponding to ramparts of the 15th century. Beyond them other and more modern suburbs incorporated with the city after 1860 stretch to the boulevards which line the outmost defences today. On the town side and beyond these, commercial or industrial in character, inhabited by the working classes and petite bourgeoisie, while here and there still are areas devoted to market gardening; those on the west are residential centres for the upper classes (Auteuil and Passy). Of the faubourgs of Paris those to the north and east are mainly commercial (Faubourgs St Denis, St Martin, Poissonnière) or industrial (Faubourgs du Temple and St Antoine) in character, while to the west the Faubourg St Honoré, the Champs Élysées and the Faubourg St Germain are occupied by the residences of the upper classes of the population. The chief resorts of business and pleasure are concentrated within the Grands Boulevards, and more especially on the north bank of the Seine. No uniformity marks the street-plan of this or the other quarters of the city. One broad and almost straight thoroughfare bisects it under various names from Neuilly (W.N.W.) to Vincennes (E.S.E.). Within the limits of the Grands Boulevards it is known as the Rue de Rivoli (over 2 m. in length) and the Rue St Antoine and runs parallel with and close to the Seine from Place de la Concorde to Place de la Bastille. From the Eastern station to the observatory Paris is traversed N.N.E. and S.S.W. for 2½ m. by another important thoroughfare—another continuation of the same route. Rivoli continued as the Boulevard St Sébastopol, as the Boulevards St Denis, St Martin, Poissonnière, St Antoine, St Honoré, St Honoré (north), St Germain, La Cité, and on the south bank as the Boulevard St Michel. The line of the Grands Boulevards from the Madeleine to the Bastille, by way of the Place de l'Opéra, the Porte St Denis and the Porte St Martin (two triumphal arches erected in the latter half of the 17th century in honour of Louis XIV.) and the Place de la République stretches for nearly 3 m. It contains most of the large cafés and several of the chief theatres, and though its gaiety and animation are concentrated at the western end—in the Boulevards des Italiens, des Capucines and de la Madeleine—it is as a whole one of the most celebrated avenues in the world. On the right side of the river may also be mentioned the Rue Royale, from the Madeleine to the Place de la Concorde; the Malesherbes and Haussmann boulevards, the first stretching from the Place Madeleine north-west to the fortifications, the second from the Grands Boulevards near the Place de l'Opéra nearly to the Place de l'Etoile; the Avenue de l'Opéra, which unites the Place du Palais Royal, approximately level with the central point of the Place de l'Opéra, the Rue de la Paix, connecting the Place Vendôme with the Place de l'Opéra, and noted for its fashionable dress-making establishments, and the Rue Auber and Rue du Quatre Septembre, also terminating in the Place de l'Opéra, in the vicinity of which are found some

1 The plateau of Mont Avron on the east side, which was provisionally fortified in 1870, is not now defended.

2 The word boulevard means "bulwark" or fortification and thus has direct reference to the old ramparts. But since the middle of the 16th century the title has been applied to new thoroughfares not traced on the site of an old enceinte.
of the finest shops in Paris; the Rue St Honoré running parallel with the Rue de Rivoli; from the Rue Royale to the Central Markets; the Rue de Lafayette, one of the longest streets of Paris, traversing the shadow of the Opera to the Tuileries; the Boulevard Magenta, from Montmartre to the Place de la République; and the Rue de Turbigo, from this place to the Halles Centrales. On the left side of the river the main thoroughfare is the Boulevard St Germain, beginning at the Pont Sully, skirting the Quartier Latin, the educational quarter on the north, and terminating at the Pont de la Concorde after traversing a quarter mainly devoted to ministries, embassies and other official buildings and to the residences of the noblesse.

**Squares.**—Some of the chief squares have already been mentioned. The finest is the Place de la Concorde, laid out under Louis XV, by J. Gabriel. The fountain, known as the Fontaine des Mers, and the statue of the Medusa by B. Carpeaux crowns the middle of the square, surmounted by the statue of the statue of Marianne Antoinette and many other victims of the Revolution. The central decoration consists of an obelisk from the great temple at Luxor in Upper Egypt, presented to Louis Philippe in 1831 by Mehemet Ali, and flanked by two monumental fountains. The formation of the Place Vendôme is a contrast; it is a combination of the Renaissance and the Baroque. The chief of these is the fashionable Avenue des Champs Élysées which connects it with the Place de la Concorde; while on the other side the Avenue de la Grande Armée leads to the fortifications, the two avenues being joined by the Pont de la Concorde. The Place de la Concorde was laid out between 1792 and 1794 and the Avenue de Bois de Boulogne forms the threshold of the celebrated park of that name. In the centre of the Place, the Arc de Triomphe de l'Étoile, the largest triumphal arch in the world (162 ft. high by 147 ft. wide), was constructed to commemorate the victory of Austerlitz and it was received by a lion and a horse with draperies around them. The work was begun in 1796 and finished in 1806. The column is 330 ft. high and surmounted by a statue of the Emperor Napoleon I., and decorated with plates of bronze which are depicted scenes from the campaign of 1805. The Place de l'Étoile is thus a romantic and picturesque memorial of the victory of Austerlitz and the memory of the Napoleonic era. The Place de la Concorde is an example of the use of the Place and the Rue de Rivoli (a fine monumental structure leading to the Tuileries) and of those of Solférino, La Concorde, Alexandre III. (the finest and most modern bridge in Paris, its foundation-stone having been laid by the czar Nicholas II. in 1896), Invalides, Alma, Iéna (opposite the Champ de Mars), Passy, Grenelle and Mirabeau. The Seine has at times caused disastrous floods in the city, as in January 1842.

The Seine is a river which the whole world admires. From its banks can be seen the Champs Elysées, the Tuileries, the Louvre, the Panthéon, the Institut de France, the Hôtel de Ville, the Conciergerie, the Madeleine, the Invalides, the Dauphine, the Eiffel Tower, the Montparnasse, the Arc de Triomphe, the Pont Neuf, the Pont d'Arcole, the Pont de la Tournelle, the Pont St Michel, the Pont du Carrousel, the Pont Royal (a fine stone structure leading to the Tuileries), and the Pont des Arts. The Seine is the most romantic and picturesque of all the rivers in France. It is divided into two parts by the Ile St Louis and the left bank; that of St Louis between the Ile St Louis and La Cité. The Cité connects with the right bank by the Pont d'Arcole, the Pont Notre-Dame, built on foundations of the 15th century, and the Pont au Change, offering its name to the shops of the money-changers and goldsmiths which bordered its medieval predecessor; with the left bank by that of the Archévché, the so-called Pont au Double, the Petit Pont and the Pont St Michel, the original of which was built in the 11th century. Below the Pont Neuf come the Pont des Arts, Pont du Carrousel, Pont Royal (a fine stone structure leading to the Tuileries), and those of Solférino, La Concorde, Alexandre III. (the finest and most modern bridge in Paris, its foundation-stone having been laid by the czar Nicholas II. in 1896), Invalides, Alma, Iéna (opposite the Champ de Mars), Passy, Grenelle and Mirabeau. The Seine has at times caused disastrous floods in the city, as in January 1842.

The houses of Paris nowhere abut directly on the river banks, which in their whole extent from the bridge of Austerlitz to Passy are protected by broad embankments or 'quais.' At the foot of these lie several ports for the unloading and loading of goods, &c.—on the right side Bercy for wines, La Rapée for timber, Port Mazas, the Port de l'Arsenal at the mouth of the Martin canal, 1 the Port Henry IV., des Celstins, St Paul, des Ormes, de l'Hôtel de Ville (the two latter for fruit) and the Port St Nicolas (foreign vessels); on the left bank the Port de la Gare for petroleum, St Bernard for wines and the embarkation of sewage, and the ports of La Tournelle (old iron), Orsay (building material), the Invalides, Gros Cailou, the Cygnes, Grenelle and Javel (refuse). Besides the river ports, the port of Paris also includes the canal of la Marne, which is the source of the two canals of St Denis and the Ourcq within the walls. All three debouch in the buoy and extensive basin of La Villette in the north-east of the city. The traffic of the port is chiefly in coal, building materials and stone, manure and fertilizers, agricultural produce and food-stuffs.

**Promenades and Parks.**—In the heart of Paris are situated the gardens of the Tuileries 2 (56 acres), designed by André Le Notre after Louis XIV. These are attached to and altered afterwards they retain the main outline designed by Le Notre. They are laid out in parterres and bosquets, planted with chestnut trees, lindens and plane trees, and adorned with playing fountains and basins, and numerous statues mostly antique in subject. From the terrace along the river-side a fine view is to be had over the Seine to the park and palace of the Trocadéro; and

---

1 This canal (3 m. long) leaving the Seine below Austerlitz bridge, passes by a tunnel under the Place de la Bastille and Boulevard Richard Lenoir, and rises by sluices to the La Villette basin, from which the St Denis canal (4 m. long) descends to the Seine at St Denis. In this way boats going up or down the river can avoid passing through Paris. The canal de l'Hurcar, which supplies the two canals mentioned, contributes to the water-supply of Paris as well as to its transport facilities.

2 These gardens are the property of the state, the other areas mentioned being the property of the town.
from the terraces along the Place de la Concorde the eye takes in the Place and the Avenue of the Champs Élysées. The gardens of the Luxembourg,1 planned with towers under the flanked church of the Club of Triomphe by The Newspaper (17th century), and situated in front of the palace occupied by the state, are about the same size as those of the Tuileries; with less regularity of form they present greater variety of appearance. In the line of the main entrance extends the beautiful Observatory Walk, terminating in the monumental fountain mentioned above. Besides these gardens laid out in the French taste, with straight walks and regular beds, there are several in what the French designate the English style. The finest and most extensive of these, the Buttes-Chaumont Gardens, in the north-east of the city, occupy 57 acres of very irregular ground, which up to 1866 was occupied by plaster-quarries, limekilns and brickworks. The “buttes” or knolls are now covered with turf, flowers and shrubbery. Advantage has been taken of the varying relief of the site to form a fine lake and a cascade with picturesque rocks. The Montsouris Park, in the south of the city, 38 acres in extent, also consists of broken ground; in the middle stands the meteorological observatory, built after the model of the Tunisian palace of Bardo, and it also contains a monument in memory of the Flatters expedition to the Sahara in 1851. The Bois de Boulogne, in the aristocratic quarter to the north of the Boulevard Haussmann, is a continuation of the old park belonging to King Louis Philippe, and contains monuments to Chopin, Gounod, Guy de Maupassant and others.

The Jardin des Plantes1 (founded in the first half of the 17th century), about 55 acres in extent, combines both styles. Its museum of natural history (1793), with its zoological gardens, its botanic and mineralogical gardens, its museums of zoology, anatomy, anthropology, botany, mineralogy, meteorology, and chemistry, with its laboratories, and its courses of lectures by the most distinguished professors in all branches of natural science, make it an institution of universally acknowledged value.

Other open spaces which for the most part are in the Champs Élysées (west of the Place de la Concorde), begun at the end of the 17th century but only established in their present form since 1858; the Trocadéro Park, laid out for the exhibition of 1878, with its lakes, cascade and aquarium; the Champs de Mars and Trocadero Gardens, laid out about 1770 as a manœuvring ground for the École Militaire, containing the Eiffel Tower (q.v.); the gardens of the Palais Royal, surrounded by galleries; and the Kanelagh in Fassy.

The Bois de Boulogne and Bois de Vincennes situated outside the fortifications are on a far larger scale than the parks within them. The Bois de Boulogne, commonly called the “Bois,” is reached by the wide avenue of the Champs Élysées as far as the Arc de Triomphe, beyond which is the avenue of the Bois de Boulogne or that of the Grande Armeée. The first of these, of its site was occupied by passengers and equestrians, grass-plots, flower-beds and elegant buildings, affords a wide prospect over the Bois and the hills of St Cloud and Mont Valérien. The Bois de Boulogne covers an area of 2500 acres and is occupied by the St Cloud and Mont Valérien, with menageries, conservatories and aquarium, are largely visited by pleasure-seekers. Trees for the public parks and squares are grown in the municipal nurseries situated on the south border of the Bois des Boulognes, but coincided with the Park of La Muette, with the old royal château. The Bois de Vincennes contains 3000 acres in area and is similarly adorned with streams, lakes and cascades.

Churches.—The most important church in Paris is the cathedral of Notre-Dame, founded in 1163, completed about 1240. Measuring 139 yds. in length and 52 yds. in breadth, the church consists of a choir and apse, a short transept, and a nave with double aisles, which are continued round the choir and are flanked by more churches with the completion of the rest of the church. The central spire, 148 ft. in height, is the course of a restoration carried out between 1846 and 1879 under the direction of Viollet le Duc. Two massive square towers crown the principal façade. Its three doors are decorated with fine early Gothic carving and surmounted by a row of figures representing twenty-eight kings of Israel and Judah. Above the central door is a rose window, above which is a third storey consisting of a graceful gallery of pointed arches supported on slender columns. The transept has two façades, also richly decorated with chiselled work and containing rose windows. Of the elaborate decoration of the interior all that is medieval is a part of the screen of the choir (the first half of the 14th century), with sculptures representing scenes from the life of Christ, and the stained glass of the rose windows (13th century). The woodwork in the choir (17th century), and a marble group called the “Vow of Louis XIII.” (17th century) by Coquille and Calixt, are other noticeable works of art. The church possesses the Crown of Thorns and a fragment of the Cross, which attract numerous pilgrims.

Paris is poor in Romanesque architecture, which is represented chiefly in the nave and transept of St Germain-des-Prés, the choir of which is Gothic in tendency. The church, which once belonged to the celebrated abbey of St Germain founded in the 6th century, contains fine modern frescoes by Hippolyte Flandrin. The Transition style is also exemplified in St Pierre-de-Montmartre (12th century). Besides the cathedral there are several churches of the Gothic period, the most important being St Julien-le-Pauvre, now as a Greek church, which is contemporary with Notre-Dame; St Germain-l’Auxerrois (13th to 16th centuries), whose projecting porch is a graceful work of 1435; St Séverin (mainly of the 13th and 16th centuries); St Gervais, largely in the Flamboyant style, and St Maclou, with a fine façade by S. Debroesse in the classical manner; and St Merry (1520-1567), with a fine façade in architonic architectural. St Gervais, St Merry and St Germain all contain valuable works of art, the stained glass of the two former being especially notable.

St Étienne-du-Mont combines the Gothic and Renaissance styles in its nave and transept, while its choir is of Gothic, its façade of pure Renaissance architecture. In the interior, one of the most beautiful in the city, there is a fine rood loft (1600-1609) by Pierre Cardin, which stands against one of the finest Gothic windows of the 16th and early 17th centuries; a chapel contains part of the sarcophagus of St Geneviève, which is the object of a pilgrimage. St Eustache (1532-1640), though its construction displays many Gothic elements, with the exception of a Classical façade of the 18th century, to this day, it is adorned with a unique and varied portico, which, in respect to the more important French churches. The church contains the sarcophagus and other remains of St. Cosmats and of other eminent men.

Of churches in the Classical style the windows of the 17th and 18th centuries, St Paul-St Louis (1679-1685), and the church (1645-1665) of the former manor of Val-de-Grâce (now a military hospital and medical school), which has a dome built after the model of St Peter’s at Rome. All these churches are in the city.

Of the churches of the 17th century, the most remarkable is that of the Sacré-Cœur, an important resort of pilgrims, begun in 1876 and overlooking Paris from the heights of Montmartre. The Sacré Coeur is in the Romanesque style, but is surrounded by a Byzantine wall. The church, which is dedicated by the dioceses of Savoy and known as “La Savoyarde” weighs between 17 and 18 tons. Of the other modern churches the oldest is the Madeleine, built under Napoleon I. by Pierre Vignon on the foundation of a church of the 18th century and finished in 1842. It was intended by the emperor as a “temple of glory” and is built on the lines of a Roman temple with a fine colonnade surrounding it. The interior, consisting of a single nave bordered by chapels and roofed with cupolas, is decorated with sculptures and painting by eminent modern artists. Notre-Dame-de-Paris (1861-1876), and St Vincent-de-Paul (1824-1844) are in the style of early Christian basilicas. Both contain good frescoes, the frieze of the nave in St Vincent-de-Paul being an elaborate work by Hippolyte Flandrin. Ste Clotilde, which was founded by Ingres, and St Sulpice in Paris, dates from the middle of the century. St Augustin and La Trinité in the Renaissance style were both built between 1860 and 1870. With the exception of Ste Clotilde in the St Germain quarter and the成绩 of the churches above mentioned are all in the northern quarters of Paris.

Civil Buildings.—The most important of the civil buildings of Paris is the palace of the Louvre (Laparo), the south front of which extends along the Seine for about half a mile. It owes its origin to Philip Augustus, who erected a huge keep defended by a rectangle of fortifications in what is now the south-west corner of the quadrangle, where its plan is traced on the pavement. The fortress was demolished by Francis I. and under that monarch and his successors Pierre Lescot built the portions of the wings to the south and west of the courtyard, which is the best example of Renaissance architecture. The rest
of the buildings surrounding the courtyard date from the reigns of Louis XIII. and XIV., the most noteworthy feature being the colonnade (1666-1670) of the east façade designed by Claude Perrault. The two wings projecting westwards from the corners of the quadrangle, each consisting of two parallel galleries with pavilions at intervals, were built under Napoleon III., with the exception of the Grande Galerie and at right angles to it the Pavillon Henry IV., containing the Apollo gallery, which were erected on the river front by Catherine de Medici and Henry IV. Of these two wings that on the north is occupied by the ministry of finance. The history of the palace of the Tuileries (so called in allusion to the tile kilns which occupied its site) is intimately connected with that of the Louvre, its origin being due to Catherine de Medici and Henry IV. The latter built the wing, rebuilt under Napoleon III., which united it with the Grande Galerie, the corresponding wing on the north side dating from various periods of the 19th century. The palace itself was burnt by the Communists in 1871, with the exception of the termination pavilion on the east (Pavillon de Flore); only the northern terminal pavilion (Pavillon de Marsan, now occupied by the museum of decorative arts) was rebuilt.

Next in importance to the Louvre is the Palais de Justice (law courts), a haphazard assemblage of buildings covering the greater part of the Île de la Cité to the west of the Boulevard du Palais. During the Gallo-Roman period the site was occupied by a citadel which became the palace of the Merovingian kings and afterwards of the Capetians. The towers were subsequently occupied by the parlement of Paris, which in turn was moved over to Charles V. In 1618, 1737 and 1770 the building was ravaged by fire, and in its present state is in great part the outcome of a systematic reconstruction begun in 1840. In the interior the only medieval remains are the Sainte-Chapelle, the Conciergerie, an old prison where Marie Antoinette and other illustrious victims of the Revolution were confined. The most characteristic feature of which is the fine Salle des Pas Perdus, the successor of the Grand' Salle, a hall originally built by Philip the Fair and rebuilt after fires in 1618 and 1671. The Sainte-Chapelle, one of the most perfect specimens of Gothic art, was originally built for St Louis as a shrine for the crown of thorns and other relics now at Notre-Dame, and was restored in the 19th century. It comprises a lower portion for the use of the servants and retainers and the upper one for the king, the upper half was afterwards adapted as a dining room by lofty windows set close together and filled with beautiful stained glass. The Palais de Justice presents towards the west a Greek façade by J. L. Duc (d. 1679), which is reckoned among the finest architectural productions of its kind. The towers are four, each provided with two lions which are dates from the 11th to the 13th century. The Musée Carnavalet was built by the architect François de Kernerkenov, whose present name, and enlarged in 1791; Mme de Sévigné afterwards resided there. The national archives are housed in the Hôtel Souvres, a mansion of the early 18th century with 19th-century additions, standing on the site of a house built by Olivier de Clisson in 1370. It was afterwards added to by the family of Guise and rebuilt by François de Rohan, duke of Rohan. The palace of Cardinal Mazarin, augmented in modern times, is on the site of the Jardin des plantes, formerly the garden of a 17th-century garden of the state, and is a most imposing building erected under Louis XIV., according to the designs of Charles Le Brun and Guillaume Dupré (the architect of the Louvre on the left bank of the Seine), with its interesting collections, partly occupies the site of an Augustinian convent and comprises the old Hôtel Chalins. It was erected from 1620 to 1638 and added to later, and was last occupied by the Académie des Sciences. The municipal building designed by J. L. Duban. The courtyard contains part of the façade of the Norman church of Guillon (16th century), which was destroyed at the Revolution, and the portal of the château of Anet (erected by Philippe Delorme in 1548) has been adapted as one of the entrances. The Grand Palais des Beaux-Arts, where horse-shows, &c., as well as annual exhibitions of paintings and sculptures are held, and the Petit Palais des Beaux-Arts, which contains art collections belonging to the city, date from 1897-
PARIS

1900. Both buildings stand close to the north end of the Pont Alexandre III.

The tower, built in imitation of an ancient temple, dates from the first half of the 19th century; the Tribunal of Commerce and the Palais du Trocadéro, built for the exhibition of 1889, are similar in design and stand at the latter half of that period, to which also belongs the Hôtel des Postes et Télégraphes.

Among the numerous historic mansions of Paris a few demand special mention. The so-called Maison de Francois Ier, a small but beautifully decorated building erected at Mone in 1527 and re-erected in Paris in 1826. In the Saint Gervais quarter are the Hôtel de Beauvais of the latter half of the 17th century and the Hôtel Lamoignon. The Hôtel Lambert, a large mansion, built by Nicholas Lambert and afterwards inhabited by Mme de Chatelet and Voltaire and George Sand, has a magnificent staircase and many works of art. The Hôtel de Sully, built for the Duke of Sully from 1624 to 1630, is in the Rue St Antoine and has an interesting courtyard. Of the fine mansion of the dukes of Burgundy the only relic is a tower of the early 15th century built by Jean Sans Peur.

Theatres, &c.—Of the theatres of Paris four—the Opéra, the Opéra-Comique, the Théâtre Français and the Odéon—receive state subventions, amounting in all to 541,000 per annum. The Opéra (entitled the National Academy of Music) was originally founded in 1671 by Pierre Perrin, from whom the management was taken over by Jean Baptiste Lully. The opera house is also the residence of the French Academy of Music. The theatre contains one storey with allegorical groups (Music by Guillaume; Lyric Poetry by Jouffroy; Lyric Drama by Perraud; and Dancing by Carpeaux) and allegorical statues. Surrounding its walls are large grouped representations and masks and groups of statues with white plumes. The auditorium. Behind that rises the vast pediment above the stage decorated at the corners with Pegasi by Lequesne. On the summit of the pediment an Apollo, raising aloft his lyre, is seen against the sky, while below there is a group of Muses. Above the stage is a flamboyant scroll-work, statues, paintings, &c. The grand vestibule, with statues of Lully, Rameau, Gluck and Handel, the grand staircase, the foyer or corridor leading to the foyer, and the foyer or interior of the theatre, contain many and diverse works of art, and are of the finest designing, of the best materials and of the finest execution.

The Théâtre Français or Comédie Française was formed in 1661 under the name of the union of Molière’s company with two other notorious French troupes. Of the buildings of the Comédie Française dates from 1791, when part of the company headed by the tragedian Talma migrated to the south-west wing of the Palais Royal, which the company, reunified in 1799, has since occupied. Both the Théâtre Français and the Odéon—erected in 1755—lie close to the Luxembourg garden, represent the works of the classical dramatists and modern dramas both tragic and comic. The Opéra-Comique, founded in the early 19th century, occupies a building in the Boulevard des Italiens reconstructed after the fire of 1877. See also light opera is performed in the Théâtre Lyrique.

Other theatres well known and long established are the Gymnase (chiefly comedy), the Vaudeville and the Porte St Martin (serious drama and comedy), the Variétés and the Palais Royal (farce and vaudeville), the Théâtre Français, the Théâtre de la Porte Saint-Martin and the Porte Saint-Denis. Of the Concerts Colonne are also of a high order. Musical and local performances of a more popular kind are given at the music halls, cafés concerts and cabarets artisques, with which the city abounds.

Paris is the chief centre for sport in France, and the principal societies for the encouragement of sport have their headquarters in the city. Among these may be mentioned the Société d’encouragement pour les sports français, the Société du football français (with the Jockey Club), which is the chief authority in the country as regards racing, and the Union des sociétés françaises de sports athlétiques, which comprises committees for the organization of athletics, football, lawn tennis and amateur sport generally. The Royal Club de France, the Stade français and the Union athlétique du premier arrondissement are the chief Parisian athletic clubs. Race meetings are held at Longchamp and Auteuil in the Bois de Boulogne, and at Chantilly, Vincennes, St Cloud, St Ouen, Maisons-Laffitte, &c.

Museums.—Some of the more important museums of Paris require notice. The richest and most celebrated occupies the Louvre. On the ground floor are museums (1) of ancient sculpture, containing such treasures as the Venus of Milo, the Pallas of Velletti (the most beautiful of all statues of Minerva), the colossal group of the Tiber, discovered at Rome in the 18th century, &c.; (2) of the Renaissance sculpture, comprising works of Michelangelo, Jean Goujon, Germain Pilon, &c., and rooms devoted to early Christian antiquities and works by the Della Robbia and their school; (3) of the French sculptors, including the work of Baudry, Gervais and others; (4) of Egyptian sculpture and inscriptions; (5) of art from Assyria, Palestine, Phoenicia and other parts of Asia; (6) of engraved gems.

On the first floor are (1) the picture galleries, rich in works of the Italian painters, especially of Leonardo da Vinci (including his Mona Lisa), Raphael, Titian and Paolo Veronese; of the Spanish masters Murillo is best represented; and there are numerous works by Rubens, Rembrandt and Holbein. The examples of French art form about one-third of the collection, and include (1) the collection bequeathed in 1869 by Dr La Caze (chiefly works of the 18th century); (2) a collection of ancient bronzes; (3) a collection of furniture of the 17th and 18th centuries; (4) a museum of drawings by great masters; (5) a museum of Medieval, Renaissance and modern art pottery, objects in bronze, glass and ivory, &c.; (6) the Rothchild collection of objects of art; (7) smaller collections of Chinese, Japanese and Cambodian objects, all belonging to the city of Paris. There is also a department devoted to the history of the city, containing collections of documents and models and objects relating to the city.

The Carnavalet museum comprises a collection illustrating the history of the city. The Petit Palais des Beaux-Arts contains art collections belonging to the city (especially the Dutuit collection.)

The museum of the Luxembourg, installed in a building near the Luxembourg Palace occupied by the royal family, contains the Picpus, a museum of his paintings, and that of Victor Hugo, Place des Vosges, contains a collection of Madame Récamier’s apartments.

The Trocadéro Palace contains a museum of casts illustrating the progress of sculpture, chiefly that of France, from the 11th to the 18th century, it also possesses a collection of Khmer antiquities from Cambodia and an ethnological museum. In the same neighborhood are the Guimet museum, containing the collections of Oriental pottery, of objects relating to the Oriental religions and of antiquities presented to the state in 1885 by Emile Guimet of Lyons; and the Chavannes museum, containing a collection of tapestries and other works of art belonging to the city. The Cernuschi Oriental museum, close to the Monceau Park, was bequeathed to the city in 1895 by M. Cernuschi.

The collection of glass, porcelain and antiques of the Bibliothèque Nationale are important; as also are the industrial and machinery exhibits of the Conservatoire des Arts et Métiers.

For libraries see Libraries.

Population.—Paris is divided into twenty arrondissements. Only the first twelve belonged to it previous to 1860; the others correspond to the old suburban communes then annexed. The first four arrondissements occupy the space on the right side of the river, extending from the Place de la Concorde to the Bastille, and from the Seine to the line of the Grands Boulevards; the 5th, 6th and 7th arrondissements lie opposite them to the left side; the 8th, 9th, 10th, 11th and 12th surround the first four; and the 13th, 14th, 15th and 16th are out of the old suburban communes of the left side; and the 16th, 17th, 18th, 19th and 20th out of the old suburban communes of the right side.

The growth of the population during the 19th century is shown in the following table, which gives the population present on the census day, including the population complète et part. i.e. troops, inmates of hospitals, prisons, schools, &c.
Below is shown the population of the arrondissements separately (in 1906), together with the comparative density of population therein. The most thickly populated region of Paris comprises a zone stretching northwards from the Île de la Cité and the Île St Louis to the fortifications, and including the central quarters of St Gervais with 400 inhabitants to the acre, St Auvio with 391 inhabitants to the acre, and Bonne-Nouvelle with 466 inhabitants to the acre. The central arrondissements on the north bank, which (with the exception of l., the Louvre) are among the most densely populated, tended in the latter part of the 19th century to decrease in density, while the outlying arrondissements (XII—XX) with the exception of Batignolles and Montmartre are comparatively thinly populated, increased in density, and this tendency continued in the early years of the 20th century.

The birth-rate, which diminished steadily in the 19th century, is low—on an average 54,000 births per annum (1901—1905) or 202 per 1000 inhabitants as compared with 311 in 1851—1855. The death-rate also is low, 48,000 deaths per annum (1901—1905), averaging 179 deaths per 1000 inhabitants. This is accounted for by the fact that Paris is pre-eminently a town of adults, as the following figures, referring to the year 1908, show:

In these circumstances there is nothing remarkable in the annual number of marriages in Paris (26,000), a high marriage rate (9-8 per 1000) for the total number of inhabitants, but a low one (28-4 per 1000) compared with the number of marriageable persons.

A large number of the inhabitants (on an average 656 out of every 1000) are not Parisians by birth. The foreign nationalities chiefly represented are Belgians, Germans, Swiss, Italians, Luxembourgers, English, Russians, Americans, Austrians, Dutch, Spaniards, the Belgians, Germans, and Italians, mostly artisans, live chiefly in the industrial districts in the north and east of the city. The English and Americans, on the other hand, congregate in the wealthy districts of the Champs Elysées and Passy.

**Municipal Administration.**—Each arrondissement is divided into four quarters, each of which nomiations a member of the municipal council. These 80 councillors, together with 21 additional councillors elected by the cantons of the rest of the department, form the departmental council. The chief functionaries of the arrondissement are a mayor (maire) and three deputies (adjoints) appointed by the president. The mayors act as registrars, draw up elections, and recruiting lists, and superintend the poor-relief of their arrondissement. There is a justice of the peace (jugé de paix) nominated by the government in each arrondissement. There is no elective mayor of Paris: the president of the municipal council, who is nominated by his colleagues, merely acts as chairman of their meetings. When occasion requires, the function of mayor of Paris is discharged by the prefect of Seine. The municipal council discusses and votes the budget of the city, scrutinizes the administrative measures of the two prefects and deliberates on, municipal affairs in general. The prefect of Seine and the prefect of police (both magistrates named by the government, but each with a quite distinct sphere of action) represent the executive authority as opposed to the municipal council, which latter has no power, by refusing a vote of credit, to stop any public service the maintenance of which legally devolves on the city: in case of such refusal the minister of the interior may officially insert the credit in the budget. In like manner he may appeal to the head of state to rate to cancel a decision in which the council has exceeded its legal functions.

The prefecture of Seine comprises the following departments (directions), subdivided into bureaux:

1. Municipal affairs, including bureaux for the supervision of city property, of provision, of cemeteries, of public buildings, &c.
2. Departmental affairs (including the bureau concerned with the case of lunatics and foundlings).
3. Primary education.
4. Streets and public works, including the bureau of water, canals and sewers, and the bureau of public thoroughfares, promenades and lighting.
5. Finance.

The administrative functions of the prefect necessitate a large technical staff of engineers, inspectors, &c., who are divided among the various services attached to the departments. There are also a number of councils and committees on special branches of public work attached to the prefecture (commission des logements insalubres, de statistique municipale, &c.). The administration of the three important departments of the octroi, poor-relief (assistance publique) and pawnbroking (mont-de-piété) is also under the control of the prefect.

The prefecture of police includes the whole department of Seine and the neighbouring communes of the department of Seine-et-Oise—Meudon, St Cloud, Versailles and Enghien. Its sphere embraces the apprehension and punishment of criminals (Police judiciaire), general police-work (including political service) and municipal policing. The state, in view of the non-municipal functions of the Paris police, repays a proportion of the annual
MUNICIPAL ADMINISTRATION

PARIS

budget which this préfecture receives from the city. The budget of the préfect of police is voted en bloc by the municipal council.

Besides numerous duties consequent on the maintenance of order, the inspection of weights and measures, authority over public spectacles, surveillance of markets and a wide hygienic and sanitary authority belong to the sphere of this préfect. In the last connexion mention may be made of an important body attached to the préfecture of police—the Conseil d’Hygiène Publique et de Salubrité of the department of the Seine, composed of 24 members nominated by the préfect of police and 17 members called to it in virtue of their office. To it are referred such questions as the sources from which to obtain drinking-water for the town, the sanitary measures to be taken during important works, the work connected with the main sewers for the cleaning of the Seine and the utilization of the sewage water, the health of workpeople employed in factories, the sanitary condition of the occupants of schools and prisons, questions relating to the disinfection of infected districts, the heating of public vehicles and dwellings, the conveyance of infected persons, night shelters, &c. Board of health (commissions d’hygiène) in each of the twenty arrondissements act in co-operation with this central department. In the case of police, consisting of brigades of gardiens de la paix, are divided among the arrondissements in each of which there is an officier de paix in command. There are besides six brigades in reserve, one attached to the central markets, another entrusted with the surveillance of cabs, while the others are held in readiness for exceptional duties, e.g., to reinforce the arrondissement brigades at public ceremonies or in times of disorder. In nearly every quarter there is a commissaire de police, whose duties are of a semi-legal nature; the police require his sanction before they can commit an arrested individual to prison, and he also fulfills magisterial functions in minor disputes, &c.

Finance.—The chief item of ordinary expenditure is the service of the municipal debt, the total of which in 1908 was nearly £135,000,000. Its annual cost rose from £722,000 in 1860 to £3,583,000 in 1875 and £4,826,000 in 1905. In the latter year the other chief items of expenditure were:

The total of ordinary revenue was £14,365,000, and of all revenue, ordinary and extraordinary, £25,426,000.

Communications.—Passenger-transport is in the hands of companies. Ordinary diligences are the property of the Compagnie Générale des Omnibus, founded in 1855, which has a charter conferring a monopoly until 1910 in return for a payment of £80 per annum for each vehicle. The organisation of the omnibus service is in the supervision of the préfect of the Seine. Since 1880 motor-driven omnibuses have been in use. The Compagnie Générale owns a number of tramways, and there are several other tramway companies. The cab companies, the chief of which are the Compagnie des Bateaux Pariiens and the Compagnie Urbaine de Paris, are not under monopoly. The use of the taximeter is general and motor-cabs are numerous. Cabs pay a license fee and are under the surveillance of the préfect of the Seine as regards tariff and the concession of stations. The steamers (bateaux-moussis) of the Compagnie Générale des Bateaux Parisiens ply on the Seine between Charenton and Suresnes.

The great railways of France, with the exception of the Midi railway, all terminate in the western stations in Paris. The principal stations of the northern, eastern and western systems (that of the latter known as the Gare St Lazare) lie near the outer boulevards in the north-western part of the city; the terminus of the Paris-Lyon-Méditerranée railway is in the south-east, close to the right bank of the Seine; opposite to it, on the left bank, is the station du Quai d’Austerlitz, and on the Quai d’Orsay the Gare du Quai d’Orsay, both belonging to the Orléans railway. The Gare Montparnasse, to the south-west of the Seine, is used by the western and the state railways. Other less important stations are the Gare de Vincennes (line of the eastern railway to Vincennes), the Gares du Luxembourg and de Paris-Denfert (line of the Orléans railway to Sceaux and Limours), and the Gare des Invalides (line of western railway to Versailles).

Railway communication round Paris is afforded by the Chemin de Fer de l’Est (now part of the Orléans railway), and by the Lines of the Rouen-Montargis railway, which are the chief lines of the eastern part. There are three separate tracks on the line of the eastern railway to Vincennes, the Gares du Luxembourg and de Paris-Denfert, and the Gare des Invalides, being the chief line. Wood and macadam come next in importance to stone, and there is a small proportion of asphalt roadways. The upkeep and cleaning is under the supervision of a branch of the department of public works (service technique de la voirie publique et de l’éclairage), and for this purpose the city is divided into sections, each comprising two or three arrondissements. All streets having a width of 25 ft. or more are planted with rows of trees, chestnuts and elms. The street culture is the chief function of the system of the wide thoroughfares there are planted strips down the middle.

The upkeep (exclusive of cleansing) of the thoroughfares cost about £500,000, towards which the state, as usual, contributed £120,000, and the department £160,000. In the same year the cleansing cost £56,000. The street culture is conducted by the owners of the property bordering it; but in the case of avenues of exceptional width they bear only a proportion of the outlay. Payments are exacted in return for the right to erect newspaper stands, &c., to place chairs and tables on the footways, and similar concessions.

Water.—The water and sewage system of Paris is supervised by a branch of the public works department (bureau des eaux, canaux et bassins) which is responsible for the supply of spring water and a supply for industrial and street cleansing purposes, derived from rivers and artesian wells. The domestic supply, which averaged 55,000,000 gallons daily in 1905, has three sources of origin:

1. The springs of the Dhuys, to the east of Paris, whence the water is conveyed by an aqueduct 82 m. in length to a reservoir in the quarter of Ménilmontant.
2. Springs of the Ourcq, south-east of Paris, whence the water comes by an aqueduct 108 m. in length to a reservoir near Montsouris Park. The springs of the Loing and Lunain, south-east of Paris, also supply the Montsouris reservoir.
3. The springs of the Avre, near Verneuil, to the west of the city, the water from which is 63 m. in length and ends at the St Cloud reservoir.

In addition, filtering installations at the pumping station of Ivry, St Maur and elsewhere make it possible to supplement the domestic supply with river water of high quality.

Water for public and industrial purposes is obtained (1) from pumping stations at Ivry and other points on the banks of the Seine, and at St Maur on the Marne; (2) from the Ourcq canal, which starts at the end of the Villette basin in the Seine, and (3) from artesian wells and the aqueduct of Arcueil from Rungis, the latter being of trifling importance. The water is stored in reservoirs in the higher localities of the city, which for the purposes of distribution is divided into zones of altitude; thus the water from the Villette basin, stored at the Montsouris reservoir at an altitude of only 260 ft., is supplied to the central and lowest part of the city. The upper parts of the quarters of Montmartre, Belleville and Montreouge being entitled to benefit by the supply from the ordinary reservoirs, it is supplied from elevated reservoirs, to which the water is pumped by special works.

The water is distributed throughout the city by two systems: the low or variable pressure, carrying the river water for use in the houses and in the lower districts; and the high pressure, carrying the spring water to the various floors of buildings, and supplying hydraulic lifts, drinking fountains and fire-plugs. The total length of pipes is nearly 1600 m. The water arrives in all cases from two kilometres from the sources, and on entering the city the supply may be reduced to a minimum. Consumers are supplied by meter (compteur) at a price of 35 centimes the cubic metre (domestic supply) and at a minimum charge of 16 centimes for river water. It is distributed by a company (Compagnie générale des eaux), which acts as a collecting agent and receives a commission on the takings. Its charter expires at the end of 1910.

Drainage.—The drainage system of Paris comprises four main collectors, with a length in all of nearly 20 m.; 27 m. of secondary collectors and several hundred miles of ordinary sewers. Its capacity is such that the Seine (except in certain cases of exceptional pressure, such as sudden and violent storms) is kept free from sewage...
water, which is utilized on sewage farms. The larger sewers, which vary between 9 and 20 ft. in width, are bordered by ledges, between which the water runs, and are cleansed by means of slides exactly fitting the channel and mounted on wagons or boats propelled by the power of men. The middle or north-eastern quarters of the city and debouching in the Seine at St Denis is the longest (7 m.). The other main sewers converge at Clichy, on the right bank of the Seine, where a powerful elevator forces an impetus upon the sewage, which is then carried by the sewers unaided to the hills above Argenteuil (right bank), where begins a conduit extending westwards. This conveys a portion of the sewage to a third elevator at Pierrelaye, whence it is distributed on the hills of Mantes and Louvres, and from thence by the sewers of the station fields of Carrières-sous-Poissy (right bank), and finally those of Mureaux, opposite Meulan. Certain parts of Paris lie too low for their drains to run into the main sewers, and special elevators are required to raise the sewage of the districts of Beray, Javel and the Cité. The sewers are used as conduits for water-pipes, gas-pipes, telegraph and telephone wires and pneumatic tubes.

Lighting.—Gas-lighting in Paris is in the hands of a company whose operations are supervised and directed by municipal engineers. The company pays to the municipality an annual sum of £8000 for the privilege of laying pipes in the streets and 2 centimes for every cubic metre of gas consumed; in addition, there is paid another sum, after the expense of works and stock, are divided with the municipality. The company is bound to supply gas at 30 centimes per cubic metre to private consumers and at half that price for public services. In 1905 the total rate of gas consumed was 1,242,000,000 cubic metres. It was provided that on the expiration of its charter the plant should be made over to the municipality. Electric light is supplied by a number of companies, to each of which in return certain payments are made by the municipality as well as by the department. The concession, which carries with it no monopoly, the municipality has an electrical station of its own beneath the central markets.

Law and Justice (see France: Justice, for an account of the judicial system as a whole).—Paris is the seat of four courts having jurisdiction over all France: (1) The Tribunal de Paris, for settling disputes between the judicial and administrative authorities on questions as to their respective jurisdiction; (2) the Cour d'appel for the appeal of cases from the departmental courts; (3) the Cour des Comptes; and (4) the Cour de Cassation. The first three sit in the Palais Royal, the fourth in the Palais de Justice, which is also the seat of (1) a cour d'appel for seven departments (seven civil chambers, one chamber of appeal for the correctional police, one chamber for preliminary proceedings); (2) a cour d'assises; (3) a tribunal of first instance for the department of Seine, comprising seven chambers for civil business, one for petty criminal cases and one for commercial and a tribunal of commerce. The conseils de prud'hommes settle disputes between workmen and employers, or between workmen and masters; the whole initiative, however, rests with the parties. The judges of these bodies sit in Paris (for the metal trades, the chemical trades, the textile trades and building industries), composed of an equal number of masters and men. The tribunal of commerce, sitting in a building opposite the Palais de Justice, is composed of three judges elected by the notables of their order, and deals with cases arising out of commercial transactions; declarations of bankruptcy are made before it; it also acts as registrar of trademarks and of articles of association of companies; and as court of appeal in industrial and civil cases.

Prisons.—There are three places of detention in Paris—the Dépôt of the prefecture of police (in the Palais de Justice), where persons arrested and not released by the commissaries of police are temporarily detained; (2) the Paris préfecture, which receives and sends away all of the convicts under the jurisdiction of Mazas, Ste Pélagie and La Grande-Roquette, the demolition of which was ordered in 1894, have been replaced by the prison of Fresnes-les-Rungis for condemned prisoners. The prison of Fresnes-les-Rungis comprises: (1) a central prison, where are confined those undergoing short sentences, those sentenced to hard labour while awaiting transference to their final place of detention or to sentences over a year, and sick prisoners occupying the central infirmary of the prison; (2) two other separate lodges for children, replaced by the agricultural and horticultural colony of Montesson, inaugurated in 1896.

Education (see also France).—In 1905 there were 170 public écoles maternelles (kindergartens) with 57,000 pupils, and 48 private schools of the kind with 7,800 pupils, besides a certain number of écoles enfantines, exclusively managed, as are the écoles maternelles, by women, and serving as a link between the latter and the écoles primaires, for timid and backward children of from 6 to 8 years of age. There were 374 public primary schools with 173,000 pupils, while over 60,000 children were educated in private primary schools. Subsequent to the founding of the écoles normales of these schools (treasuries), which give clothing, &c., to indigent children and maintain the cantines scolaires for the provision of hot mid-day meals; the classes de garde and the garderies, which look after children beyond the hours of instruction; the internats primaires, which are used for a small payment board and lodge children whose parents or guardians are unable to do so satisfactorily.

The écoles primaires, which give a course of 3 or 4 years, number 868 for boys (College Chapital, écoles, J. B. Say, Turgot, Colbert, Lavoisier, Arago) and two for girls (Sophie Germain and Edgar Quinet). Supplementary courses take the place at these schools of the first three years of the primary school and most for schooling after leaving the primary school. Side by side with the higher primary school, the teaching in which has a commercial rather than an industrial bias, are the écoles professionnelles, technical schools for the training of craftsmen. The Ecole Diderot trains pupils in wood- and iron-working; the Ecole Girard Plon teaches practical drawing, and the Ecole Barnard-Palissy teaches applied art; the Ecole Boullé trains cabinet-makers, and the Ecole Estienne teaches all the processes connected with book-production. The school of physics and chemistry imparts both theoretical and practical knowledge of these sciences. The Ecole Dorian is a school of the same type as the Ecole Diderot, but is intended for very poor children. There are also the special classes, a kind of private boarding-school, in which the children are lodged. Six écoles ménagères train girls in the duties and employments of their sex. The municipality also provides gratuitous popular courses in scientific and historical subjects at the Hôtel de Ville and at the Conservatory. In 1903 the number of students amounted to 30,000. There are also various institutions of instruction (the Philotechnic Association, the Polytechnic Association, the Union française de la jeunesse, &c.). Teachers for the elementary primary schools are recruited from two training colleges in the city.

Secondary and Higher Education.—There are 13 lycées for boys and a municipal college—the Collège Rolin. These give classical and modern courses, and usually have classes preparing pupils for one or more of the government schools. For girls there are five lycées.

The five faculties of medicine, law, science, literature and Protestant theology, and the higher school of pharmacy, form the body of faculties, which are controlled by a special ministry, and includes the Faculté de Pharmacie. The Faculté de Pharmacie is located in the Centre de Pharmacie, an imposing building at the corner of Rue des Francs-Bourgeois and Rue de la Roquette, and is the largest institute of its kind in the world. The school was founded in 1863.

The faculties of science and literature, together with their library, are established at the Sorbonne, which is also the seat of the académie, of which Paris is the centre, and of the École des charles. The faculty of medicine with its laboratories (École pratique) occupies separate buildings near the Sorbonne. The law school is also close to the Sorbonne. Of the 12,600 students at the university in 1905-1906 some 1260 were foreigners, Russians and Rumanians being mostly students or scholars in the four faculties of letters and science. The students are largely attended, some 6000 students being enrolled therein. The Collège de France, founded by Francis I, and situated opposite the Sorbonne, gives instruction of a popular kind to adults of the general public. It has seven chairs and a council of 40 members and 40 chairs. The Musée d'histoire naturelle gives instruction in the natural sciences; the École pratique des hautes études, whose students are instructed at the Sorbonne and other scientific establishments in the city, has for its object the encouragement of scientific research. In addition, there are several great national schools attached to various ministries. Dependent on the ministry of education are the École normale supérieure, for the training of teachers in elementary, the Ecoles des charles; the conservatoire, and the use of music; the École spéciale des langues orientales, for the training of interpreters; the École nationale et spéciale des beaux-arts (painting, sculpture, architecture, &c.), in the various departments of which are concentrated the brilliant young artists of the period of study in Italy; the Conservatoire national de musique et de déclamation (music and acting), which also confers a grand prix and possesses a fine library and collection of musical instruments; the Conservatoire des arts et métiers; the Conservatoire des arts et métiers; the Conservatoire des arts et métiers; the Conservatoire des arts et métiers; the Conservatoire des arts et métiers; the Conservatoire des arts et métiers. The Institut national agronomique, a higher school of scientific agriculture, is dependent on the ministry of agriculture, and the École coloniale for the instruction of agricultural students.
both of natives of French colonies and of colonial functionaries, on the
ministry of the colonies. The Ecole nationale des ponts et chaussées for the
training of government engineers, and the Ecole nationale supérieure des mines for mining engineers, are under the
department of the interior. Of foreign universities, the most prominent are the Catholic institute, with faculties of law
and theology and schools of advanced literary and scientific studies, the Pasteur institute, founded by Pasteur in 1886 and famous for
the treatment of hydrophobia and for its research-laboratory for the study of infectious diseases, and the Institut national d'histoire
politis and governmental careers. The two latter receive state subvention.
There are numerous private associations giving courses of instruction,
the most important being the Philotechnic Association, the Poly-
tecchnic Institution and the Union françoise de la jeunesse.
Among the numerous learned societies of Paris the first in
importance is the Institut de France (see ACADEMIES). The French
Association for the advancement of the sciences, founded in 1782, is
beaten of the lower British society, and, like it, meets every year in a different town.
In art Paris has long held a leading place. The Société des
Artistes français holds an annual salon or exhibition in May and
June, and at the Salon de la propriété (for which the Princely
royal appointment of the Duke of Chartres) is the most important
artistic event of the year. There is also a second annual drawing
of the Academy of Fine Arts, and the Société centrale des arts décoratifs, of
which the most notable event is the biennial exhibition in the Palais de l'Iena.
In Paris the sale of art is very active. The most important
of the auctioneers is Sotheby, in whose rooms the sale of works of art
is of the highest interest. There is also the sale of pictures at
Chantilly, which is held by the Société des antiquaires de France.
The textile industries hardly exist in Paris; there are a few
manufactory in the Bievre, but the leather industry is chiefly represented
by the production of moose leather goods classed as articles de Paris.
Machineries, the ete de la manufacture, and the manufacture, are
maintained by the municipality, where those in search of work or
workers are put in touch with one another.
Markets.—The slaughter-houses, cattle-yards, and with few excep-
tions the wholesale markets, are also held every day. The
slaughter-house is the abattoir général de la Villette, covering
a space of 47 acres in the extreme north-east of the city on the
bank of the Canal de l'Ourcq; adjoining it, with an area of about 35 acres,
are the wholesale meat-markets of Paris, which are visited by the wholesale
buyers and markets, which have accommodation for many thousands of
animals, and are connected with the Ceinture railway so that the
cattle-trucks are brought straight into the market. Cattle-traders and
market-keepers of all kinds are also profiteers, but besides them
are less extensive slaughter-yards at Vaugirard. Most of the
cattle come from Calvados, Maine-et-Loire, Vaucluse, Nièvre,
Loire-Inférieure and Orne; sheep from Seine-et-Marne, Aveyron,
Aisne, Cher, and other eastern departments; goats from the
south, of which the most important are those of the department of
Alquier-Debrousse. The wholesale market of Paris is also noted
for its flowers, which are sent from the south, and the wines, for which
there is no other market in the world. The wholesale market of
Paris is also noted for its flowers, which are sent from the south,
and the wines, for which there is no other market in the world.

**PARIS**

**HISTORY**

The larger manufacturing establishments of Paris comprise
engineering and repairing works connected with the
railways, similar private works, foundries and sugar refineries.
Government works are the tobacco factories of Gols Cailou and
Reims. Of the other manufactures of Paris the most important are
the establishment, under the ministry of justice; the mint (with a collection
of medals and coins), established in an 18th century building
close to the Pont Neuf and under the control of the ministry of finance;
and the Manufacture des cartes (with its magnificent cabinet
museum) of the Gobelins, under the minister of education. The list
of minor establishments is varied, most of them being devoted to
the production of the so-called articles de Paris (leathers, artificial
flowers, dolls, toys and fancy goods in general), and carrying the principle
of the division of labour to an extreme. The establishments
which rank next to those above mentioned in the number of
workmen are the pharmaceutical factories, the gasworks, the
printing-offices, cabinet-makers' workshops, tailoring and
dressmaking establishments, the workshops for the production of
artefacts in enamel, etc.

The textile industries hardly exist in Paris; there are a few
industries in the Bievre, but the leather industry is chiefly represented
by the production of moose leather goods classed as articles de Paris.
Machineries, the ete de la manufacture, and the manufacture, are
maintained by the municipality, where those in search of work or
workers are put in touch with one another.
Markets.—The slaughter-houses, cattle-yards, and with few excep-
tions the wholesale markets, are also held every day. The
slaughter-house is the abattoir général de la Villette, covering
a space of 47 acres in the extreme north-east of the city on the
bank of the Canal de l'Ourcq; adjoining it, with an area of about 35 acres,
are the wholesale meat-markets of Paris, which are visited by the wholesale
buyers and markets, which have accommodation for many thousands of
animals, and are connected with the Ceinture railway so that the
cattle-trucks are brought straight into the market. Cattle-traders and
market-keepers of all kinds are also profiteers, but besides them
are less extensive slaughter-yards at Vaugirard. Most of the
cattle come from Calvados, Maine-et-Loire, Vaucluse, Nièvre,
Loire-Inférieure and Orne; sheep from Seine-et-Marne, Aveyron,
Aisne, Cher, and other eastern departments; goats from the
south, of which the most important are those of the department of
Alquier-Debrousse. The wholesale market of Paris is also noted
for its flowers, which are sent from the south, and the wines, for which
there is no other market in the world. The wholesale market of
Paris is also noted for its flowers, which are sent from the south,
and the wines, for which there is no other market in the world.
from time to time visited the coasts of Britain. So few were its inhabitants that they early put themselves under the protection of their powerful neighbours, the Senones, and this feudalship was the source of the political dependence of Paris on Sens throughout the Roman period, and of a religious subordination which lasted till the 17th century. The capital did not at once take the name of the Parisii, whose centre it was, but long kept that of Lutetia, Lucetia or Lutetia, of which Lutèce is the generally recognised French form.

During the War of Gallic Independence, after being subjugated by Caesar, who even in 53 B.C. made their territory the meeting-place of deputies from all Gaul, the Parisii took part in the great rising of the year 52, at the same time separating their cause from that of the Senones, who were held in check by Caesar's lieutenant, Labienus. They joined their forces to the army commanded by an Aurelian, the old Camulodunum, which in turn was to unite with the Bellovac to crush Labienus advancing from Sens to attack the Parisians. Having marched along the right bank of the river till opposite Lutetia, Labienus learned that the Bellovac were in arms, and, fearing to find himself between two armies at a distance from his headquarters, he sought to get rid of Camulodunum, who, posted on the lefthand, endeavoured to bar his way. The bridges had been cut and the town burned by order of the Gallic chief. By means of a stratagem Labienus drove his opponents up the river to theitable now occupied by the Jardin des Plantes, and quietly by night crossed the Seine lower down in the neighbourhood of Grenelle, near a place which Caesar calls Metisod eux, identified, but not conclusively, with Meudon. The Gaules, retracing their steps a little, met the Romans and allowed themselves to be routed and dispersed; their leader fell in the front of the battle. Still unsubdued, the Parisii were called upon by the general council assembled in Alesia to furnish eight thousand men to help in raising the siege of that city. It is doubtful whether they were able to contribute the whole of this contingent, when their powerful neighbours the Bellovac managed to send only two thousand of the ten thousand demanded of them. This was their last effort, and after the check at Alesia they took no part in the desperate resistance offered by the Bellovac.

Lutetia was somewhat neglected under the Roman emperors of the first centuries. Its inhabitants continued quietly carrying on their river traffic, and devoted part of their wealth to the maintenance of a great temple to Jupiter built on the site of the present cathedral of Notre Dame. It was not known at what date Christianity was introduced into the future capital of France; but it is probable, judging by the use of the title "the city," that Lutetia was one of the earliest of the bishoprics of Gallia Celsa. The name of the founder of the church is known, but a keen controversy, not yet settled, has recently been raised with regard to the date when the first Roman missionary, St Dionysius or Denis, reached the banks of the Seine, along with his two deacons, Rusticus and Eleutherius. A pious belief, which, in spite of its antiquity, has its origin in nothing better than parochial vanity, identifies the first-named with Dionysius the Areopagite, who was converted by St Paul at Athens, and thus takes us back to the middle of the 1st century of the Christian era. Better founded in the opinion which dates the evangelization of the city two centuries later; the regular list of bishops, of whom, after Denis, the most famous was St Marcel, begins about 250.

Lutetia was in some sort the cradle of Christian liberty, having been the capital, from 292 to 306, of the mild Constantius Chlorus, who put an end to persecution in Britannia, Gaul and Spain, over which he ruled. This emperor fixed his residence on the banks of the Seine, doubtless for the purpose of watching the Germans without losing sight of Britannia, where the Roman authority was also feared. He probably had the basis of the same fancy for Lutetia which Julian afterwards expressed in his works and his letters. Be that as it may, the fact that these two princes chose to live there naturally drew attention to the city, where several buildings now rose on the left side of the river which could not have been reared within the narrow boundaries of the island. There was the imperial palace, the remains of which, a magnificent vaulted chamber, beside the Hôtel de Cluny, are now known, probably correctly, as Julian's Baths. At some distance up the river, in the quarter of St Victor, excavations in 1870 and in 1883 laid bare the foundations of the amphitheatre, which was capable of holding about 10,000 spectators, and thus suggests the existence of a population of 20,000 to 25,000 souls. Dwelling-houses, villas, and probably also an extensive cemetery, occupied the slope of the hill of St Geneviève.

It was at Lutetia that, in 360, Julian, already Caesar, was in spite of himself proclaimed Augustus by the legions he had more than once led to victory in Germany. The troops invested his palace, which, to judge by various circumstances of the mutiny, must have been of great extent. As for the city itself, it was as yet but a little town (rolixyn) according to the imperial author in his Misopogon. The successive sojourns of Valentinian I. and Gratian scarcely increased its importance. The latest emperors preferred Théves, Arles, and Vienne in Gaul, and, besides, allowed Paris, about 410, to be absorbed by the powerful Armorician league. When the patricians, Aetius, Aegidius and Syagrius, held almost independent sway over the small portion of Gaul which still held together, they dwelt at Soissons, and it was not till Clovis' reign many years after the decisive battle between the defeat of Syagrius (486) and the surrender of Paris (497), which opened its gates, at the advice of St Geneviève, only after the conversion of the Frankish king. In 508, at the return of his victorious expedition against the south, Clovis made Paris the official capital of his realm—Calpharam regni constittit, says Gregory of Tours. He chose as his residence the palace of the Thormae, and lost no time in erecting on the summit of the hill, as his future place of interment, the basilica of St Peter and St Paul, which became not long afterwards the church and abbey of St Geneviève. After the death of Clovis, in spite of the supremacy granted to the kingdom of Austrasia, or Metz, Paris remained the true political centre of the various Frankish states, insomuch that the four sons of Clothaire, fearing the prestige which would attach to whoever of them might possess it, made it a sort of neutral town, though after all it was seized by Sigebert, king of Austrasia, Chilperic, king of Neustria (who managed to keep possession for some time, and repaired the amphitheatere), and Guntram, king of Burgundy. The last sovereign had to defend himself in 585 against the pretender Gondovaid, whose ambition aspired to uniting the whole of Gaul under his dominion, and marching on Paris to make it the seat of the half-barbarian half-A南京市 administration of the kingdom of which he had dreamed.

Numerous calamities befell Paris from 586, when a terrible conflagration took place, to the close of the Merovingian dynasty. During a severe famine Bishop Landry sold the church plate to alleviate the distress of the people, and it was probably he who, in company with St Eloi (Eligius), founded the Hôtel Dieu. The kings in the long run almost abandoned the town, especially when the Austrasian influence under the mayors of the palace tended to shift the centre of the Frankish power towards the Rhine.

Though the Merovingian period was for a time a period of the deepest decadence, Paris was nevertheless adorned and enriched by pious foundations. Monuments has already been made of the abbey of St Peter, which became after the death of Clovis the abbey of St Geneviève. On the same side of the river, but in the valley, Childebert, with the assistance of Bishop St German, founded St Vincent, known a little later as St German-des-Prés, which was the necropolis of the Frankish kings before St Denis. On the right bank the same king built St Vincent le Rond (afterwards St Germain l'Auxerrois), and in La Cité, beside the cathedral of St Etienne, the basilica of Notre Dame, which excited the admiration of his contemporaries, and in the 12th century obtained the title of cathedral. Various monasteries were erected on both sides of the river, and served to group in thickly-peopled suburbs the population, which had grown too large for the island.
PARIS

815

Carthusian monastery already stood. Colleges were erected to receive the students of the different countries, and became the great meeting-place of the studious youth of all Europe.

The right side of the river, where commerce and industry had taken up its abode, and where the Louvre, the abbey of St Martin, and a large number of secondary religious establishments were already erected, became a centre of activity at least as important as that on the left. The old suburbs, too, were now incorporated with the town and enclosed in the new line of fortifications constructed by Philip Augustus, which, however, did not take in the great abbey of the left side of the river, and thus obliged them to build defensive works of their own.

Philip Augustus issued from the Louvre a celebrated order, that the streets of the town should be paved. Not far from his palace, on the site of the present Halles Centrales, he laid out an extensive cemetery and a market-place, which both took their name from the Church of the Innocents, a building of the same reign, destroyed at the Revolution. Fountains were placed in all the quarters. As for the lighting of the town, till the close of the 16th century the only lamps were those in front of the madonnas at the street corners. But the first "illumination" of Paris was undertaken under Philip Augustus: on his return from a victorious expedition to Flanders in 1214 he was welcomed by the Parisians as a conqueror; and the public rejoicings lasted for seven days, "interrupted by no night," says the chronicler, alluding to the torches and lamps with which the citizens lighted up the fronts of their houses. Ferrand, count of Flanders, the traitor vassal, was dragged behind the king to the dungeons of the Louvre.

In 1226 there was held at Paris a council which, by excommunicating Raymond VII., count of Toulouse, helped to prepare the way for the most important treaty which had as yet been signed in the capital. By this treaty (April 12, 1226) the regent, Blanche of Castile, the widow of Louis VII., obtained from Raymond VII. a great part of his possessions, while the remainder was secured to the house of Capet through the marriage of Alphonsine of Poitiers, brother of St Louis, with Jeanne, the heiress of Languedoc.

In affection for his capital St Louis equalled, or even surpassed, his grandfather Philip, and Paris reciprocated his goodwill. The Val de Grace was completed under Philip Augustus; at that time the provost of Paris, a judiciary magistrate and police functionary whose extensive powers had given rise to the most flagrant abuses. Louis IX. reformed this office and filled it with the judge of greatest integrity to be found in his kingdom. This was the famous Etienne Boileau, who showed such vigilance and uprightness that the capital was completely purged of evildoers; the sense of security thus produced attracted a certain number of new inhabitants, and, to the advantage of the public revenue, increased the value of the trade. It was Etienne Boileau who, by the king's express command, drew up those statutes of the commercial and industrial guilds of Paris which, modified by the necessities of new times and the caprice of princes, remained in force till the Revolution.

St Louis caused a partial restoration of St Germain l'Auxerrois, his parish church (completed in the 13th century, and deplorably altered under Louis XV.); and besides preferring the palace of La Cité to the Louvre, he entirely rebuilt it, and rendered it for the most comfortable residences of his time. At this edifice there still remain, among the buildings of the present Palais de Justice, the great guard-room, the kitchens with their four enormous chimneys, three round towers on the quay, and, one of the marvels of the middle ages, the Sainte Chapelle, erected in 1248 to receive the crown of thorns sent from Constantinople. This church, often imitated during the 15th and 16th centuries, is like an immense shrine in open work; its large windows contain admirable stained glass of its own date, and its paintings and sculptures (restored in the 19th century by Viollet-le-Duc) give a vivid picture of the religious beliefs of the middle ages. It has a lower storey ingeniously arranged, which served as a chapel for the palace servants. The Sainte Chapelle was designed by Pierre de Montereau, one of the most

1 After the suppression of the Templars in 1312 the Temple was assigned to the Knights of St John. It was used as a state prison in this capacity until the 17th century. The church and the greater part of the other buildings survived in the 17th century. At the Revolution the keep (1265 or 1270) alone survived of the Templars' buildings. It was here that Louis XVI. and the royal family were imprisoned. It became a place of pilgrimage for the Royalists, and was, in consequence, pulled down under the Empire in 1811. Its site is occupied by the Place du Temple.
PARIS

[CHAPTER]

celebrated architects of his time, to whom is attributed another marvel still extant, the refectory of the abbey of St Martin, now occupied by the library of the Conservatoire des Arts et des Métiers. This incomparable artist was buried in the abbey of St Germain-des-Prés, where, too, he had raised magnificent buildings now no longer existing. Under St Louis, Robert de Sorbon, a common priest, founded in 1253 an unpretending theological college which afterwards became the celebrated faculty of the Sorbonne, whose decisions were well-nigh as authoritative as those of Rome.

The capital of France had but a feeble share in the communal movement which in the north characterizes the 11th, 12th and 13th centuries. Placed directly under the central power, it was never strong enough to force concessions; and in truth it did not claim them, satisfied with the advantages of all kinds secured for it by its political position and its university. And, besides, the privileges which it did enjoy, while they could be revoked at the king's pleasure, were of considerable extent. Its inhabitants were not subjected to forced labour or arbitrary imposts, and the liberty of the citizens and their commerce and industry were protected by wise regulations. The university and all those closely connected with it possessed the fullest rights and liberties. There was a municipal or bourgeois militia, which rendered the greatest service to Philip Augustus and St Louis, but afterwards became an instrument of revolt. The communal administration was conducted by the chiefs or jureux, who, in conjunction with the notables, chose a nominal mayor called provost of the merchants (prévôt des marchands). The powers of this official had been grievously curtailed in favour of the provost of Paris and his lieutenants, named by the sovereign. His main duties were to regulate the price of provisions and to control the incidence of taxation on merchandise. He was the chief inspector of bridges and public wells, superintendent of the river police, and commandant of the guard of the city walls, which it was also his duty to keep in repair. And, finally, he had jurisdiction in commercial affairs until the creation of the consular tribunals by the chancellor Michel L'Hôpital. The violent attempts made by Étienne Marcel in the 14th century, and those of the communions of 1793 and 1871, showed what reason royalty had to fear too great an expansion of the municipal power at Paris.

The town council met in the 13th and 14th centuries in an unpregnating house on Ste Geneviève, near the city walls on the left side of the river. The municipal assemblies were afterwards held near the Place de Grève, on the right side of the river, in the “Maison aux Piliers,” which Francis I. allowed to be replaced by an imposing hôtel de ville.

The last of the direct descendants of Capet, and the first two Valois kings did little for their capital. Philip the Fair, however, increased its political importance by making it the seat of the highest court in the kingdom, the parlement, which he organized between 1302 and 1304, and to which he succeeded a part of his cité palatine. Under the three sons of Philip the Fair, the Tour de Nesle, which stood opposite the site now occupied by the Bibliothèque Nationale, was the scene of frightful orgies, equally celebrated in history and romance. One of the queens, who, if the chronicles are to be trusted, took part in these expiated her crimes in Château-Gaillard, where she was strangled in 1315 by order of her husband, Louis X. During the first part of the War of the Hundred Years, Paris escaped being taken by the English, but felt the effects of the national misfortunes. Whilst destitution excited in the country the revolt of the Jacquerie, in the city the miseries of the time were attributed to the vices of the feudal system, and the citizens seemed ready for insurrection. The provost of the merchants, Étienne Marcel, equally endowed with courage and intellect, sought to turn this double movement to account in the interest of the municipal liberties of Paris and of constitutional guarantees. The cause which he supported was lost through the violence of his own acts. Not content with having massacred two ministers under the very eyes of the dauphin Charles, who was regent whilst his father John lay captive in London, he joined the Jacquerie, and was not afraid to call into Paris the king of Navarre, Charles the Bad, a notorious firebrand, who at that time was making common cause with the English. Public sentiment, at first favourable to Marcel's schemes, shrank from open treason. A watch was set on him, and, at the moment when, having the keys of the town in his possession in virtue of his office, he was preparing to open one of the gates, he was assassinated by order of Jean Maillard, one of the heads of the milice, on the night of the 31st of July 1358. Marcel had enlarged Philip Augustus's line of fortifications on the right side of the river, and had begun a new one.

When he became king in 1364, Charles V. forgot the outrages he had suffered at the hands of the Parissians during his regency. He robbed the Louvre to some extent of its military equipment, in order to make it a convenient and sumptuous residence; his open-work staircases and his galleries are mentioned in terms of the highest praise by writers of the time. This did not, however, remain always his favourite palace; having built or rebuilt in the St Antoine quarter the mansion of St Paul or St Pol, he was particularly fond of living in it during the latter part of his life, and it was there that he died in 1380. It was Charles V. who, in conjunction with the provost of Paris, Hugues Aubriot, erected the famous Bastille to protect the St Antoine gate as part of an enlarged scheme of fortification. A library which he founded—a rich one for the times—became the nucleus of the national library. With the exception of some of the upper portions of the Sainte Chapelle, which were altered or reconstructed by this prince or his son Charles VI., there are no remains of the buildings of Charles V.

The reign of Charles VI. was as disastrous for the city as that of his father had been prosperous. From the very accession of the new king, the citizens, who had for some time been relieved by a great reduction of the taxes, and had received a promise of further alleviation, found themselves subjected to the most odious fiscal exactions on the part of the king's uncle, who was not satisfied with the well-stored treasury of Charles V., which he had unscrupulously pillaged. In March 1382 occurred what is called the revolt of the "Maillotins" (i.e. men with mallets). Preoccupied with his expedition against the Flemings, Charles VI. delayed putting down the revolt, and for the moment remitted the new taxes. On his victorious return on the 10th of January 1382, the Parissians in alarm drew up their forces in front of the town gates under the pretext of showing their sovereign what aid he might derive from them, but really in order to intimidate him. They were ordered to retire within the walls and to lay down their arms, and they obeyed. The king and his uncles, having destroyed the gates, made their way into Paris as into a besieged city; and with the decapitation of Desmarets, one of the most faithful servants of the Crown, began a series of bloody executions. Ostensibly through the intercession of the regents an end was put to that species of severities, a heavy fine being substituted, much larger in amount than the annual value of the abolished taxes. The municipal administration was suspended for seven years, and its functions bestowed on the provost of Paris, a magistrate nominated by the Crown.

The calamities which followed were due to the weakness and incapacity of the government, given over, because of the madness of Charles VI., to the intrigues of a wicked queen and of princes who brought the most bloodthirsty passions to the service of their boundless ambition. First came the rivalry between the dukes of Orleans and Burgundy, brought to an end in 1407 by assassination of the former. Next followed the relentless struggle for supremacy between two hostile parties: the Armagnacs on one side, commanded by Count Bernard of Armagnac (who for a brief period had the title of constable), and supported by the nobles and bourgeois; and on the other side the Burgundians, depending on the common people, and recognizing John the Fearless, duke of Burgundy, as their head. The mob was headed by a Skinner at the Hôtel Dieu called Simon Cabauche, and hence the name Cabauchins was given to the Burgundian party in Paris. They became masters of Paris
PARIS

in 1432 and 1433; but so violent were their excesses that the most timid rose in revolt, and the decimated bourgeoisie managed by a bold stroke to recover possession of the town. The Armagnacs again entered Paris, but their intrigues with England and their tyranny rendered them odious in their turn; the Burgundians were recalled in 1438, and returned with Cabcbo and a formidable band of pillagers and assassins. Perrinet Leclerc, son of a bourgeois guard, secretly opened the gates to them one night in May. The king resided in the Hôtel St Paul, an unconscious spectator of those savage scenes which the princes Louis and John, successively dauphins, were helpless to prevent.

The third dauphin, Charles, afterwards Charles VII., managed to put an end to the civil war, but it was by a crime as base as it was impolitic—the assassination of John the Fearless on the bridge of Montereau in 1419. Next year a treaty, from the ignominy of which Paris happily escaped, gave a daughter of Charles VI. to Henry V. of England, and along with her, in spite of the Salic law, the crown of France. The king of England made his entry into Paris in December 1420, and was there received with a solemnity which concealed the misery and real consternation of the poor people crushed by fifteen years of murders, pillage and famine. Charles VI. remained almost abandoned at the Hôtel St Paul, where he died in 1422, whilst his son-in-law went to hold a brilliant court at the Louvre and Vincennes. Henry V. of England also died in 1422. His son Henry VI., then one year old, came to Paris nine years later to be crowned at Notre Dame, and the city continued under the government of the duke of Bedford till his death in 1435.

The English rule was a mild one, but it was not signalized by the execution of any of those works of utility or ornament so characteristic of the kings of France. The church of Ste Severine, however, shows a style of architecture peculiarly English, and Sauval relates that the duke of Bedford erected in the Louvre a fine gallery decorated with paintings. Without assuming the mission of delivering Paris, Joan of Arc, remaining with Charles VII. after his coronation at Reims, led him towards the capital; but the badly conducted and abortive enterprise almost proved fatal to the Maid of Orleans, who was severely wounded at the assault of the gate of St Honoré on the 8th of September 1429. The siege having been raised, Charles awaited the invitation of the Parisians themselves upon the defection of the Burgundians and the surrender of St Denis. The St Jacques gate was opened by the citizens of the guard to the constable de Richemont on the 13th of April 1436; but the solemn entry of the king did not take place till November of the following year; subdued by his various expeditions or attracted by his residences in Berry or Touraine, he spent but little time in Paris, where he retired either to the Hôtel St Paul or to a neighbouring palace, Les Tournelles, which had been acquired by his father.

Louis XI. made equal use of St Paul and Les Tournelles, but towards the close of his life he immured himself at Plessis-lès-Tours. It was in his reign, in 1460, that the first French printing-press was set up in the Sorbonne. Charles VIII. scarcely left Plessis-lès-Tours and Amboise except to go to Italy; Louis XII. alternated between the castle at Blois and the palace of Les Tournelles, where he died on the 1st of January 1515.

Francis I. lived at Chambord, at Fontainebleau, at St Germain, and at Villers-Cotterets; but he proposed to form at Paris a residence in keeping with the taste of the Renaissance. Paris had remained for three years almost a stranger to the artistic movement begun between 1498 and 1500, after the Italian expedition. Previous to 1533, the date of the commencement of the Hôtel de Ville and the church of St Eustache, Paris did not possess, apart from the "Court of Accounts," any important building in the new style. Between 1527 and 1540 Francis I. demolished the old Louvre, and in 1541 Pierre Lescot began a new palace four times as large, which was not finished till the reign of Louis XIV. The buildings were not sufficiently advanced under Henry II. to allow of his leaving Les Tournelles, where in 1559 he died from a wound received at a tournament. His widow, Catherine de' Medici, immediately caused this palace to be demolished, and sent her three sons—Francis II., Charles IX. and Henry III.—to the unfinished Louvre. Outside the line of the fortifications she laid the foundations of the Château des Tuileries as a residence for herself.

Of the three brothers, it was Charles IX. who resided most at the Louvre; it was there that in 1572 he signed the order for the massacre of St Bartholomew. Henry III. remained for the most part at Blois, and hardly came to Paris except to be witness of the power of his enemies, the Guises.

Taking advantage of the absence of the kings, the League had made Paris a centre of opposition. The municipal militia were recruited and organised, each having the 100 men in all. Compendiums had to elect a deputy for the central council, which became the council, or rather faction, of The Sixteen, and for four years, from 1587 to 1591, held the city under a yoke of iron. Henry III., having come to the Louvre in 1588, unwillingly received there the duke of Guise, and while endeavouring to take measures for his own protection provoked a riot known as the Day of the Barricades (May 12). It was with difficulty that he escaped from his palace, which at that time had no communication with the country, and which Henry IV. afterwards proposed to unite with the Tuileries in order to provide a sure means of escape in case of need.

When, after the murder of the duke of Guise at Blois at the close of 1588, Henry III. desired to return to Paris, he was not yet master of the city, and was obliged to besiege it in concert with his presumptive heir, the king of Navarre. The operations were suddenly interrupted on the 1st of August 1589, by the assassination of the king, and Henry IV. carried his arms elsewhere. He returned with his victorious forces in 1590. This second siege lasted more than four years, and was marked by terrible suffering, produced by famine and the tyranny of The Sixteen, who were supported by the intrigues of the king of Spain and the violent harangues of the preachers. Even the conversion of the king did not allay the spirit of fanaticism, for the king's sincerity was suspected, and the words (which history, however, fails to substantiate), "Paris is surely worth a mass," were attributed to him. But after the coronation of the king at Chartres the commonality of Paris, weary of intriguing with strangers and Leaguers, gave such decided expression to its feelings that those of its leaders who had kept aloof, or broken off from the faction of The Sixteen attached themselves to the king, which had already extended the ambitious designs of the king of Spain; and after various negotiations the provost of the merchants, L'Huillier, offered the keys of the city to Henry IV. on the 22nd of March 1594. The king met no resistance except on the part of a company of German landsknechts, which was cut in pieces, and the students of the university, who, steeped in the doctrines of the League, tried to hold their quarter against the royal troops, but were dispersed. The Spanish soldiers who had remained in the town decamped next day.

Henry IV., who carried on the building of the Louvre, was the last monarch who occupied it as a regular residence. Attempts on his life were made from time to time, and at last, on the 14th of May 1610, he fell under Ravaillac's knife near the market-house in Rue de la Forneniere.

Whether royalty gave it the benefit of its presence or not, Paris continued all the same to increase in political importance and in population. Here is the picture of the city presented about 1560 by Michel de Castelnae, one of the most celebrated chroniclers of the 16th century:

"Paris is the capital of all the kingdom, and one of the most famous in the world, as well for the splendour of its parliament (which is an illustrious company of thirty judges attended by three parliaments who are assembled in it) as for the numbers (which are the best seen in human laws and acquainted with justice) as for its faculty of theology and for the other tongues and sciences,
which shine more in this town than in any other in the world, besides the mechanic arts and the marvellous traffic which render it very populous, rich and opulent; in such sort that the other towns of France and all the magistrates and subjects have their eyes directed thither as to the model of their decisions and their political administrations.

Castelnau spoke rather as a statesman and a magistrate, and did not look close enough to see that the university was beginning to decline. The progress of the sciences somewhat lessened the importance of its classes, too specially devoted to theology and literature; the eyes of men were turned towards Italy, which was then considered the great centre of intellectual advance; the colleges of the Jesuits were formidable rivals; the triumphs of Protestantism deprived it of most of the students, who used to flock to it from England, Germany and Scandinavia; and finally the unfortunate part it played in political affairs weakened its influence so much that, after the reign of Henry IV. it no longer sent its deputies to the states-general.

If the city on the left side of the river neither extended its circuit nor increased its population, it began in the 16th century to be filled with large mansions (hotels), and its communications with the right bank were rendered easier and more direct when Henry IV. constructed across the lower end of the island of La Cité the Pont Neuf, which, though retaining its original name, is now the oldest bridge in Paris. On the right side of the river commerce and the progress of centralization continued to attract new wealth, and old villages became suburbs were enclosed within the line of a bastioned first enceinte, the ramparts of Étienne Marcel being, however, still left untouched. Although Louis XIII., except during his minority, rarely stayed much in Paris, he was seldom long absent from it. His mother, Mary de' Medici, built the palace of the Luxembourg, which, after being extended under Louis Philippe, became the seat of the senate.

Louis XIII. finished, with the exception of the eastern front, the buildings enclosing the square court of the Louvre, and on the wing which was to join the palace to the Tuileries. Queen Anne of Austria founded the Val de Grâce, the dome of which, afterwards painted on the interior by Mignard, remains one of the finest in Paris. Richelieu built for himself the Palais Royal, since restored, and rebuilt the Sorbonne, where now stands his magnificent tomb by Girardon. The island of St. Louis above La Cité, till then occupied by gardens and meadows, became a populous parish, whose streets were laid out in straight lines, and whose finest houses still date from the 17th century. Building also went on in the Quartier des Marais (quarter of the marsh), and the whole of the Faubourg St. Denis and old villages became suburbs, surrounded by the ramparts of the Bastille and the Faubourg Saint-Antoine, as well as by the Faubourg Saint-Gilles, to which was added the Faubourg Saint-Jacques. The latter case with the exception of the front). The beautiful Salle des Pas-Perdus (Hall of Lost Footsteps) was added to the Palais de Justice. Besides these buildings and extensions Paris was indebted to Louis XIII. and his minister Richelieu for three important institutions—the royal printing press in 1620, the Jardin des Plantes in 1626, and the French Academy in 1635. The bishopric of Paris was separated from that of Sens and erected into an archbishopric in 1633.

As memorials of Mazarin Paris still possesses the Collège des Quatre-Nations, erected with one of his legacies immediately after his death, and since appropriated to the Institute, and the palace which, enlarged in the 19th century, now accommodates the national library.

The stormy minority of Louis XIV. was spent at St Germain and Paris, where the court was held at the Palais Royal. The intrigues of the prince of Condé, Cardinal de Retz, and (for a brief while) of Turenne resulted in a siege of Paris, during which more epigrams than balls were fired off; but the cannon of the Bastille, discharged by order of Mademoiselle de Montpensier, enabled Condé to enter the city. Bloody riots followed, and came to an end only with the exhaustion of the populace and its voluntary submission to the king. Though Louis XIV. ceased to stay in Paris after he grew up, he did not neglect the work of embellishment of the site of the fortifications of Étienne Marcel, which during the previous hundred years had been gradually disappearing, he laid out the line of boulevards connecting the quarter of the Bastille with that of the Madeleine. Though he no longer inhabited the Louvre (and it never was again the seat of royalty), he caused the great colonnade to be constructed after the plans of Claude Perrault. This immense and imposing façade, 548 ft. long, has the defect of being quite out of harmony with the rest of the building, which it hides instead of introducing. The same desire for effect, altogether irrespective of congruity, appears again in the observatory erected by the same Perrault, without the smallest consideration of the wise suggestions made by Cassini. The Place Vendôme, the Place des Victoires, the triumphal gates of St Denis and St Martin and several fountains, are also productions of the reign of Louis XIV. The hospital of La Salpêtrière, with its majestically simple dome, was finished by Libéral Bruant. The Hôtel des Invalides, one of the finest institutions of the grand monarque, was also erected, with its chapel, between 1671 and 1675, by Bruant; but it was reserved for the architect Hardouin Mansart to give to this imposing edifice a complement worthy of itself; it was he who raised the dome, admirable alike for its proportions, for the excellent distribution of its ornaments, and for its gilded lantern, which rises 57 ft. above the ground.

"Private persons," says Voltaire, "in imitation of their king, raised a thousand splendid edifices. The number increased so greatly that from the neighbourhood of the Palais Royal and St. Sulpice there were formed in Paris two new towns much finer than the old one." All the aristocracy had not thought fit to take up their residence at Versailles, and the grand vizis of the century, Corneille, Racine, La Fontaine, Molière, Madame de Sévigné, had their houses in Paris; there also was the Hôtel de Rambouillet, so famous in the literary history of the 17th century.

The halls of the Palais Royal during the minority of Louis XV. were the scene of the excesses of the regency; later on the king from time to time resided at the Tuileries, which henceforward came to be customarily regarded as the official seat of the monarchy. To the reign of Louis XV. are due the rebuilding of the Palais Royal, the "Place" now called De la Concorde, the military school, the greater part of the church of Ste Geneviève, or Panthéon (a masterpiece of the architect Soufflot), the church of St Roch, the palace of the Élysée (now the residence of the president of the republic), the Palais Bourbon (with the exception of the façade on the rue de Richelieu), the Hôtel de Soubise, the Hôtel de Sully, and the Hôtel de la Monnaie, of the old corporation of the copters, and the mint, a majesty and scholarly work by the architect Antoine, as well as the rebuilding of the Collège de France.

Louis XVI., finished or vigorously carried on the works begun by his grandfather. He did not come to live in Paris till compelled by the Revolution. That historical movement began indeed at Versailles on the 17th of June 1789, when the states-general were transformed into a constituent assembly; but the first act of violence which proved the starting-point of all its excesses was performed in Paris on the 14th of July 1789 when Paris inaugurated, with the capture of the Bastille, its "national guard," organized and then commanded by the celebrated La Fayette. At the same time the assassination of the last provost of the merchants, Jacques de Flesselles, gave the opportunity of establishing, with more extended powers, the mairie (mayorality) of Paris, which was first occupied by Bailly, and soon became, under the title of commune, a political power capable of effectively counterbalancing the central authority.

Paris had at that time once more outgrown its limits. The quarter on the left side of the river had more than doubled its extent by the accession of the great monasteries, the faubourgs of St Germain and St Marceau, the Jardin des Plantes, and the island St. Louis.

1 Owing to the armed and organized revolutionary elements in the assemblies of the Sections, which enabled the revolutionary commune to direct and control popular finances.
the whole of Mont St Geneviève. The line of the new enceinte is still marked by a circuit of boulevards passing from the Champs de Mars at Pont d'Austerlitz by Place de l'Enfer and Place d'Italie. Similar enlargements, also marked out by a series of boulevards, incorporated with the town on the right side of the faubourgs of St Antoine and Poissonnière and the quarters of La Chaussée d’Antin and Chaillot. In 1784 was begun, instead of a line of fortifications, a simple customs-wall, with sixty propylaea or pavilions in a heavy but characteristic style, of which the finest are adorned with columns or pilasters like those of Paestum. In front of the Place du Trône (now Place de la Nation), which formed as it were a façade for Paris on the east side, there were erected two lofty rostral columns bearing the statues of Philip Augustus and St Louis. Towards the west, the city front was the Place Louis XV. (Place de la Concorde), preceded by the magnificent avenue of the Champs Élysées. Between the barriers of La Villette and Pantin, where the highways for Flanders and Germany terminated, was built a monumental rotunda flanked on the ground floor by four peristyles arranged as a Greek cross, and in the second storey lighted by low arcades supported by columns(276,386),(386,736) of the Paestum type. None of these works were completed till the time of the empire. It was also in the latter part of the reign of Louis XIV, and under the first republic, that the quarter of La Chaussée d’Antin was built.

The history of Paris during the Revolutionary period is the history rather of France, and to a certain extent of the whole world (see FRANCE: HISTORY; FRENCH REVOLUTION; and the articles on the Jacobins and other clubs). During the Consulate hardly anything of note took place at Paris except the explosion of the infernal machine directed against Bonaparte on the 24th of December 1800.

The coronation of Napoleon by Pope Pius VII was celebrated in Notre Dame on the 2nd of December 1804. Eight years later, during the Russian campaign, the conspiracy of General Malet, happily suppressed, was on the point of letting loose on all France a dreadful civil war. The empire, however, was then on the wane, and Paris was witness of its fall when, after a battle on the heights of Montmartre and at the barrière de Clichy, the city was obliged to surrender to the allies on the 30th of March 1814.

For the next two months the city was in the occupation of the allies and witnessed a hitherto unique assembly of sovereigns and statesmen. Their deliberations issued on the 30th of May 1814 in the first treaty of Paris (see Paris, TREATIES OF; below). So far as the city itself was concerned, the only permanent loss that it suffered through the occupation was that of the art treasures which Napoleon had enriched it at the expense of other capitals; among these were many paintings and pieces of statuary from the Louvre, and the famous bronze horses from Venice, which were taken down from the triumphal arch of the Carrousel, and restored to the façade of St Mark’s. The expressed determination of Bliicher and his Prussians to blow up the Pont de Jena, built to commemorate Napoleon’s crushing victory of 1806, was frustrated by the vigorous intervention of Wellington and of the emperor Alexander I.

Paris under the Restoration witnessed the revival of religious ceremonies to which it had long been unaccustomed, notably the great Corpus Christi procession, in which the king himself carried a candle. Then came Napoleon’s return from Elba (March 1815) and the interlude of the Hundred Days. After Waterloo, though there was fighting round Paris, there was no effort to defend the city and the allied armies for the Parisians had grown thoroughly weary of Napoleon, and Louis XVIII, though he returned “in the baggage train of the enemy,” was received by the populace with rapturous acclamation (see Louis XVIII). The second treaty of Paris was signed on the 20th of November of the same year (see below). It left France in the occupation of 150,000 foreign troops, and the crown and government under the tutelage of a committee of representatives of the foreign great powers in Paris.

Paris now became the centre of the royalist reaction, and of a political proscription which reflected, though without its popular excesses, the White Terror of the South. The most conspicuous event of this time was the tragedy of the trial and execution of Marshal Ney (q.v.). For the rest, the only event of note that occurred in Paris under Louis XVIII was the assassination of the duke of Berry by Louvel on the 13th of February 1820. Ten years later the revolution of 1830, splendulously commemorated by the Column of July in Place de la Bastille, put Charles X. to flight and inaugurated the reign of Louis Philippe, a troublous period which was concluded by the revolution of 1848 and a new republic. It was this reign, however, that surrounded Paris with bastioned fortifications with ditches and detached forts, the outcome of the warlike fever aroused by the exclusion of France from the treaty of London of 1830 (see MEEMET ALE). The republic of 1848 brought no greater quiet to the city than did the reign of Louis Philippe. The most terrible insurrection was that of the 23rd–26th of June 1848, distinguished by the devotion and heroic death of the Archbishop Affre. It was quelled by General Cavaignac, who then for some months held the executive power. Prince Louis Napoleon next became president of the republic, and after dissolving the chamber of deputies on the 2nd of December 1851, caused himself to be proclaimed emperor just a year later.

The second empire completed that material transformation of Paris which had already been begun at the fall of the ancient monarchy. First came numerous cases of destruction and demolition caused by the suppression of the old monasteries and of many parish churches. A number of medieval buildings, civil or military, were cleared away for the sake of regularity of plan and improvements in the public streets, or to satisfy the taste of the owners, who thought more of their comfort or profit than of the historic interest of their old mansions or houses.

It was under the first empire that the new series of improvements were inaugurated which have made Paris a modern city. Napoleon began the Rue de Rivoli, built along this street the wing intended to connect the Tuileries with the Louvre, erected in front of the court of the Tuileries the triumphal arch of the Carrousel, in imitation of that of Septimus Severus at Rome; In the middle of the Place Vendôme was reared, on the model of Trajan’s column, the column of the Grand Army, surmounted by the statue of the emperor. To immortalize this same Grand Army he ordered from the architect Pierre Vignon a Temple of Victory, which without changing the form of its Corinthian peristytle has become the church of the Madeleine; the entrance to the crypt of the Champs Élysées was spanned by the vast triumphal arch De l’Étoile (of the star), which owes its celebrity not only to its colossal dimensions and its magnificent situation, but also to one of the four subjects sculptured upon its faces —the Chant du départ or Marseillaise, one of the masterpieces of Rude and of modern sculpture. Another masterpiece was executed by David of Angers—the pediment of the Panthéon, not less famous than Soufflot’s dome. The museum of the Louvre, founded by decree of the Convention on the 27th of July 1793, was organized and considerably enlarged; that of the Luxembourg was created in 1805, but was not appropriated exclusively to modern artists till under the Restoration. The Conservatoire des Arts et Métiers, due to the Convention, received also considerable additions in the old priory or abbey of St Martin des Champs, where the council of the Five Hundred had installed it in 1798.

Under the Restoration and under the government of July many new buildings were erected; but, with the exception of the Bourse, constructed by the architects Brongniart and Labarre, and the colonnade of the Chamber of Deputies, these are of interest not so much for their size as for the new artistic tendencies affected in their architecture. People had grown weary of the eternal Graeco-Roman compilations rendered

1 Notable in the history of the city for the discovery by the populace of the effectiveness of barricades against regular troops. These had been last used in the Fronde.
fashionable by the Renaissance, and reduced under the empire to mere imitations in producing which all inspiration was repressed. The necessity of being rational in architecture, and of taking full account of practical wants, was recognized; and more suggestive and plastic models were sought in the past. These were to be found, it was believed, in Greece; and in consequence the government under Louis Philippe saw itself obliged to found the French school at Athens, in order to allow young artists to study their favourite types on the spot. In the case of churches it was deemed judicious to revive the Christian basilicas of the first centuries, as at Notre Dame de Lorette and St Vincent de Paul; and a little later to bring in again the styles of the middle ages, as in the ogival church of St Clotilde. Old buildings were also the object of labours more or less important. The Place de la Concorde was altered in various ways, and adorned with eight statues of towns and with two fountains; on the 25th of October 1836 the Egyptian obelisk, bought at great expense from Egypt, was erected in the centre. The general restoration of the cathedral of Notre Dame was voted by the Chamber in 1845, and entrusted to Viollet-le-Duc; and the palace of the Luxembourg and the Hôtel de Ville were considerably enlarged at the same time, in the style of the existing edifices.

But the great transformer of Paris in modern times was Napoleon III. To him or to his reign we owe the Grand Opéra, the masterpiece of the architect Garneri; the new Hôtel-Dieu; the finishing of the galleries which complete the Louvre and connect it with the Tuileries; the extension of the Palais de Justice and its new front on the old Place Dauphine; the tribunal of commerce; the central markets; several of the finest railway stations; the viaduct at Auteuil; the churches of La Trinité, St Augustin, St Ambroise, St François Xavier, Belleville, Ménilmontant, &c. For the first international Paris exhibition (that of 1855) was constructed the “palace of industry”; the enlargement of the national library was commenced; the museum of French antiquities was created by the savant Du Sommerard, and installed in the old “hôtel” built at the end of the 15th century for the abbots of Cluny.

All this is but the smallest part of the memorials which Napoleon III. left of his presence. Not only was the city traversed in all directions by new thoroughfares, and sumptuous houses raised or restored in every quarter, but the line of the fortifications was made in 1859 the limit of the city. The area was thus doubled, extending to 7,450 hectares or 18,410 acres, instead of 3,402 hectares or 8,407 acres. It was otherwise with the population; to the 1,200,000 inhabitants which Paris possessed in 1858 the incorporation of the suburban zone only added 600,000.

Paris had to pay dear for its growth and prosperity under the second empire. This government, which, by straightening and widening the streets, from 1853, it had effectively guarded against the attempts of its internal enemies, had not sufficiently defended itself from external attack, and at the first reverses of 1870 Paris found itself prepared to overthrow the empire, but by no means able to hold out against the approaching Prussians.

The two sieges of Paris in 1870–71 are among the most dramatic episodes of its history. The first siege began on the 19th of September 1870, with the occupation by the Germans of the heights on the left side of the river and the capture of the unfinished redoubt of Châtillon. Two days later the investment was complete. General Trochu, head of the French Government and governor of the city, had under his command 400,000 men—a force which ought to have been able to hold out against the 240,000 Germans by whom it was besieged, had it not been composed for the most part of hurried levies of raw soldiers with inexperienced officers, and of national guards who, never having been subjected to strict military discipline, were a source of weakness rather than of strength. The guards, it is true, displayed a certain warlike spirit, but it was for the sole purpose of exciting disorder. Open revolt broke out on the 31st of October; it was suppressed, but increased the demoralization of the besieged and the demands of the Prussians. The partial successes which the French obtained in engagements on both sides of the river were rendered useless by the Germans recapturing all the best positions; the severity of winter told heavily on the garrison, and the armies in the provinces which were to have co-operated with it were held in check by the Germans in the west and south. In obedience to public opinion a great sortie was undertaken; this, in fact, was the only alternative to a surrender; for, the empire having organized everything in expectation of victory and not of disaster, Paris, insufficiently provisioned for the increase of population caused by the influx of refugees, was already suffering the horrors of famine. Accidental circumstances combined with the indecision of the leaders to render the enterprise a failure. Despatches sent by balloon to the army of the Loire instructing it to make a diversion reached their destination too late; the bridge of Champlâne over the Marne could not be constructed in time; the most advantageous positions remained in the hands of the Germans; and on the 2nd and 3rd of December the French abandoned the positions they had seized on the 29th and 30th of November. Another sortie made towards the north on the 21st of December was repulsed, and the besieged lost the Avron plateau, the key to the positions which they still held on that side. The bombardment began on the 17th of December, and great damage was done to the forts on the left of the Seine, especially those of Vannes and Issy, directly commanded by the Châtillon battery. A third and last sortie (which proved fatal to Renault (the painter) was attempted in January 1871, but resulted in hopeless retreat. An armistice was signed on the 27th of January, the capitulation on the 28th. The revictualling of the city was not accomplished without much difficulty, in spite of the generous rivalry of foreign nations (London alone sending provisions to the value of £80,000). On the 1st of March the Germans entered Paris. This event, to an effect by men and women with cases of petroleum (des parfums et pétroleuses). The Hôtel de Ville, the Palais de Justice, the Tuileries, the Ministry of Finance, the palace of the Legion of Honour, that of the Council of State, part of the Rue de Rivoli, &c, were ravaged by the flames; barrels of gunpowder
were placed in Notre Dame and the Panthéon, ready to blow up the buildings; and the whole city would have been involved in ruin if the national troops had not gained a last and crowning victory in the neighbourhood of La Roquette and Père-la-Chaise on the 28th of May. Besides the large number of insurgents who, taken in arms, were pitilessly shot, others were afterwards condemned to death, to penal servitude, to transportation; and the survivors only obtained their liberty by the decree of 1879.

From this double trial Paris emerged diminished and almost robbed of its dignity as capital; for the parliamentary assemblies and the government went to sit at Versailles. For a little it was thought that the city would not recover from the blow which had fallen on it. All came back, however—confidence, prosperity, and, along with that, increasing growth of population and the execution of great public works. The Hôtel de Ville was rebuilt, the school of medicine adorned with an imposing façade, a vast school of pharmacy established in the old gardens of the Luxembourg, and botanic gardens completed. The exhibition of 1878 was more marvellous than those of 1855 and 1867, and left a lasting memorial—the palace of the Trocadéro. And the chambers in 1879 considered quiet sufficiently restored to take possession of their customary quarters in the Palais Bourbon and the Luxembourg. (A. S.-P.; W. A. P.)

The Universal Exhibition of 1878, destined to show Europe that France had recovered her material prosperity and moral power, attracted a large concourse. The number of admissions was about 13,000,000. A grand fête, full of gaiety and enthusiasm, was held on the 30th of June. This was the first public rejoicing since the war. The terrible winter of 1879-1880 was the severest of the century: the Seine, entirely frozen, resembled a sea of ice. The 14th of July, the anniversary of the taking of the Bastille, was adopted as the French national holiday and celebrated for the first time in 1880. A grand military review was held in the Bois de Boulogne, at which President Grévy distributed the medals to all the regiments of the army. On the 11th of March 1881 a national loan of a thousand million francs was issued for the purpose of executing important public works. This loan was covered fifteen times. Paris alone subscribing for ten thousand millions. At the time of the legislative elections, on the 21st of August and the 4th of September 1881, several tumults occurred in the Belleville district, Gambetta, who was a candidate in the two wards of that district vainly tried to address the electors. The great orator died in the following year, on the 31st of December, from the effects of an accident, and his funeral, celebrated in Paris at the expense of the State, was attended by an immense gathering. A slight Legitimist agitation followed Gambetta's death. An unfortunate event occurred on the 29th of September 1883, the day when the king of Spain, Alphonso XII., returned from his visit to Berlin, where he had reviewed the 1st regiment of Prussian Uhlan, of which he was colonel. The cries "Down with the Uhlan!" with which he was greeted by the Paris crowd, gave rise to serious diplomatic incidents. On the 26th of May 1885 the following decree was rendered: "The Panthéon is restored to its primitive and legal destination. The remains of the great men who have merited national recognition will be preserved therein." But it was only on the 4th of August 1899 that the ashes of László Carnot, Hoche, Marceau, Latour d' Auvergne and Baudin were solemnly transported to the Panthéon. Victor Hugo's funeral was celebrated on the 1st of June 1885, and by an urgent vote they were made national obsequies. It was decided that the corpse should be exposed one day and one night under the Arc de Triomphe, veiled with an immense crape. A few days before, upon the occasion of the anniversary of the fall of the Commune, a tumultuous political manifestation had been made in front of the tomb of the Communists buried in Père Lachaise cemetery.

In 1886 the Monarchists renewed their political demonstrations; the most important one was the reception given by the Count of Paris at the Galliera mansion on the occasion of the marriage of his daughter with the King of Portugal. The Count of Paris had invited to this reception all the foreign ambassadors, and some disturbance having taken place, the Chamber of Deputies, on the 11th of June 1886, voted a law interfering sojourn upon French territory to the Orleanist, and Bonapartist pretenders to the throne of France, and also to their direct heirs. At that epoch Paris was in a state of agitation and discontent, and various catastrophes occurred. First of all came the disastrous bankruptcy of a large financial concern called the Union Générale; then the scandal concerning the traffic in decorations, in which M. Wilson, son-in-law of M. Jules Grévy, was compromised, and which eventually led to the resignation of the President; finally the deplorable Panama affair profoundly enervated the Parisians, and made them feel the necessity of shouting for a military master, some adventurer who would promise them a revenge. All this led to Boulangism. It was by wild acclamations and frantic shouts that General Boulanger was greeted, first at the review of the army on the 14th of July, then two days later at the opening of the Military Club, afterwards at the Winter Circus, where the Patriots' League held a mass meeting under the presidency of Paul Déroulède, and finally, on the 8th of July, at an immense demonstration at the Lyons railway station, when "le brav Général" left Paris to take command of the 13th army corps at Clermont Ferrand. Popular refrains were sung in the streets in the midst of immense excitement on the 27th of January 1889 at the time of the election of General Boulanger as deputy for the Seine department. A majority of 80,000 votes had invested him with an immense moral authority, and he appeared as though elected as the candidate of the entire country; but he lacked the necessary audacity to complete his triumph, and the Government having decided to prosecute him for conspiracy against the security of the state, before the Senate acting as a High Court of Justice, he fled with his accomplices, Rochefort and Dillon. All three were condemned by default, on the 14th of August, to imprisonment in a fortified enclosure.

Other events that also troubled the domestic life of Boulangism. On the 23rd of February 1889 a terrible fire destroyed the Opéra Comique during a performance, and a great many of the audience perished in the flames. The first performance of Lohengrin, which took place at the Eden Theatre on the 1st of May 1887, was also the cause of street rioting. In 1888 there were several strikes. That of the day labourers, which lasted more than a month, occasioned violent scenes, owing to the sudden death of Émile Eudes, a Communist, while he was speaking in favour of the strike at a public meeting. On the 2nd of December there were manifestations in memory of Baudin, a representative of the people, killed upon the barricades in 1831 while fighting in the defence of the Republic. But a calm finally came, and then the Parisians thought only of celebrating the centenary of the Revolution of 1789 by a universal exhibition. This exhibition contained a profusion of marvels such as had never before been seen, and indicated that enormous industrial progress had been accomplished. Sadi Carnot, who had succeeded M. Jules Grévy as President of the Republic on the 3rd of December 1887, officially opened the exhibition on the 6th of May 1889. Numerous fêtes were held in the grounds while the exhibition lasted. The Eiffel Tower and the illuminated fountains enraptured the crowd of visitors, while the Rue du Caire, with its Egyptian donkey-drivers, obtained a prodigious success. Most of the nations were represented at this exhibition. Germany alone confined her co-operation to the display of some paintings. The Shah of Persia, in honour of whom splendid fêtes were organized, and the King of Greece, the Prince of Wales, the Lord Mayor of London, several Russian grand dukes, Annamite, Tunisian, Moorish, Egyptian and African princes successively visited the Exhibition. There were 30,000,000 visitors. On the 15th of August a banquet was given in the Palais de l' Industrie by the Paris Municipal Council to the mayors in France, and 15,000 of these officials were present.

In 1890 the duke of Orleans, having attained his majority, came to Paris to draw for military service with the youngest conscripts of his class. He was arrested, and placed, first in
PARIS, TREATIES OF

[History]

the Conciergerie, and later in the prison at Clairvaux, but was released after a few months’ incarceration. The following years were remarkable for more strikes and several demonstrations by the students, which led in 1893 to considerable disturbance and police in answer to which a student was killed. On the 17th of October an enthusiastic welcome was extended to Admiral Avellan and the Russian sailors upon their arrival in Paris. It was about this time that dynamite began to be used by the Anarchists. After Ravachol, who commenced the sinister exploits of the “propaganda by acts,” it was Vaillant who threw a bomb into the “Temple of the Laws” on the 9th of December 1893, and wounded forty-six deputies. Then there was a succession of these attacks during the two following months, for Ravachol and Vaillant had found emulators. Henry scattered fear and death among the peacable customers of a brasserie, while bombs were thrown into the doorways and staircases of houses inhabited by wealthy people. Upon the steps of the Madeleine Church, Parvels, who was already the author of two dynamite plots, was struck down by the destructive machine that he was about to throw into the body of the church. Laurent Tailhade himself, who had celebrated with his pen the beauty of Vaillant’s gesture, was subsequently wounded by dynamite thrown into the Café Foy, where he was lunching.

The visit of the emperor and empress of Russia, on the 5th, 6th, and 7th of October 1896, was celebrated by incomparable feasts. The Rue de la Paix was decorated with ropes and sails, stretched across the street like the rigging of a vast vessel, in honour of the Russian sailors. Nothing could be seen anywhere except flags, cockades and badges formed of the colours of the two friendly nations. In the evening there were open-air balls, with farandoles and orchestras at all the street corners. Popular enthusiasm was again manifested on the 31st of August, when President Faure returned from his visit to the Russian court. On the 4th of May 1897 the terrible conflagration at the Charity Bazaar in the Rue Jean Goujon threw into mourning one hundred and forty families of the nobility or the aristocracy of Paris, and spread sorrow among the class always considerate in its benevolence. Then all minds were again troubled and disturbances occurred in the streets for more than two years over the Dreyfus case, dividing the French people into two camps.

President Faure died suddenly on the 18th of February 1899. The very day of his funeral, Paul Déroulède and Marcel Habert tried to make a coup d’état by urging General Roget to lead his troops, which had formed part of the guard of honour at the obsequies, against the Élysée. Immediately arrested and put in prison, Déroulède and Habert were acquitted by a unanimous jury.

M. Émile Loubet, President of the Senate, was chosen successor to M. Félix Faure. Upon his return to Paris from the Versailles Congress, where he had been elected President of the French Republic, he was greeted by hisses and cries of “Panama!” cries in no wise justifiable. Some time afterwards, Jules Guérin, by a desperate resistance against a summons of the police to give himself up, made the public believe for two months in the existence of an impregnable fortress in the Rue Chabrol, in the very centre of Paris. On the 4th of June there was a great scandal at the Auteuil Races, which President Loubet had been, according to custom, invited to attend. He was insulted and struck by Baron de Christiani, who was encouraged by the young royalists of the “Géllots Blancs” Association. A week later, the extraordinary and excessive police measures taken to prevent a disturbance at the Grand Prix occasioned the downfall of the Dupuy ministry. M. Waldeck-Rousseau then formed a cabinet, himself becoming president of the council. The new premier immediately took energetic measures against the enemies of the Republic. Compromising documents found in various domiciliary searches made among the Monarchists and Nationalists formed the basis of prosecutions before the High Court of Justice. The trial resulted in the condemnation of Jules Guérin to a term of imprisonment, and the banishment of Paul Déroulède, Marcel Habert, André Buffet and the Marquis de Lur Saluces, thereby ridiculing France of all these promoters of disorder, and opening a new era of peace, which lasted throughout the Universal Exhibition of 1900.

This exhibition covered an enormous space, including the slope of the Trocadéro, the Champ de Mars, the Esplanade of the Invalides and both sides of the Seine bordered by the Rue de Paris and the Rue des Nations. Seen from the new Alexandre III. bridge, the spectacle was as fairy-like as a stage setting. Close beside, at the left, were the palaces of the different nations, each one showing its characteristic architecture, and all being of an astonishing diversity. To the right were the pavilion of the city of Paris and the enormous greenhouses, and in the distance Old Paris, so picturesquely constructed by Robida. In short, exotic edifices and scintillating cupolas arose with unparalleled profusion, creating in the heart of Paris a veritable city of dreams and illusion. The most distant countries sent their art treasures or the marvels of their industry. The number of visitors was 51,000,000, and the personages of mark included the Shah of Persia, the King of Sweden, the King of the Belgians and the King of Greece, all of whom were successively the guests of France. On the 22nd of September 22,000 mayors accepted the invitation to the banquet offered in their honour by President Loubet, and thus solemnly welcomed their Republic within. This admirably organized banquet was spread in the Tuileries gardens. The exhibition of 1900, a brilliant epilogue of the closing century, was a grand manifestation of universal concord, of the union of peoples by art, science, industry, all branches of human genius. (De B.)

The bibliography of the history of Paris is immense, and it must suffice here, so far as authorities on the medieval period are concerned, to refer to the long list of works, &c., given by Ulysse Chevalier in his Répertoire des sources historiques du moyen âge, topo-bibliographie (Montbéliard, 1903), pp. 2267-2290. See also Lacombe, Bibliographie historique de Paris (Paris, 1880); Haussard, Histoire de Paris (Paris, 1886), and Pessayre, Nouveau dictionnaire de Paris (1904). Of general works may be mentioned specially J. C. Dulaure, Histoire physique, civile et morale de Paris (1821); new ed. continued by Leynadier and W. Schmidt, Paris, 1874; Paul Armand, Histoire de Paris (Paris, 1880), and W. Schmidt, La ville et de tout le diocèse de Paris (Paris, 1754-1758); new ed. revised and enlarged, by M. Cocheris, 1863-1867; and the Histoire de la ville de Paris, published under the authority of the municipality of which he was mayor, was issued in 1906. Important special works on later periods are W. A. Schmidt, Pariser Zustände während der Revolutionszeit, 1789-1800 (Jena, 1874-1876); French trans., Paris pendant la révolution (vol. 1, 1874-1894), and Tableaux de la révolution française (Leipzig, 1867-1870); F. Aulard, Collations bibliographiques relatifs à l’histoire de Paris pendant la révolution (1890-1903); Lanzac de Laborie, Paris sous Napoléon (1905); Simon, Paris de 1800 à 1900 (1902); Cilleux, Histoire de l’administration parisienne au xixe siècle (1906).

PARIS, TREATIES OF (1814-1815). Among the very many treaties and conventions signed at Paris those which bear the title of “treaties of Paris” par excellence are the two sets of treaties, both of the highest importance in the history of the international politics of Europe and the formation of its public law, signed in Paris on the 30th of May 1814 and the 20th of November 1815. The first embodied the abortive attempt made by the Allies and Louis XVIII. of France to re-establish lasting peace in Europe after the first abdication of Napoleon at Fontainebleau on the 11th of April 1814. The second contained the penal and cautionary measures which the Allies found it necessary to impose when the practically unopposed return of Napoleon from Elba, and his resumption of power, had proved the weakness of the Bourbon monarchy. (See EUROPE: History.)

The treaty of the 30th of May 1814 and the secret treaty which accompanied it, were signed by Talleyrand for France; by Lords Castlereagh, Aberdeen and Cathcart for Great Britain; by Counts Rasumovski and Nesselrode for Russia; by Prince Metternich and Count Stadion for Austria; and by Baron Hardenberg and W. von Humboldt for Prussia. Sweden and Portugal adhered later, and Spain adhered on the 20th of July to the public treaty, to which there were in all eight signatories.

It is this public treaty which is known as the first treaty of Paris.
PARIS—PARISH 823

It was signed in eight instruments identical in substance. The Allies, who appear as acting in the most friendly co-operation with Louis XVIII., declare that their aim is to establish a lasting peace based on the just distribution of forces among the powers, and that as France has returned to "the paternal government of her kings" they no longer think it necessary to exact those guarantees which they had been regretfully compelled to insist on from her late government. The preamble is more than a flourish of diplomatic humanity; for the treaty is extraordinarily favourable to France. Putting aside as much of the treaty as is common form, and minute details for which the text must be consulted, it secured her in the possession of all the territory she held in Europe on the 1st of January 1792 (Art. II.); it restored her colonies, except Tobago, Santa Lucia, Ile de France (Mauritius), Rodriguez, and the Seychelles, surrendered to England and the part of San Domingo formerly Spanish, which was to return to Spain (Art. VIII.). Sweden resigned her claim on Guadaloupe (Art. IX.); Portugal resigned French Guiana (Art. X.). The rectifications of the European frontier of France are detailed in the eight subsections of Art. III. They were valuable. France obtained (1) a piece of territory south of Mons; (2 and 3) a larger piece around Philippeville, on the Sambre and Meuse; (4) a rectification including Sarrelouis; (5) a part of the frontier on the Meuse between the city of Landau with her own dominions; (6) a better frontier on the east at Douvres; (7) a better frontier as against Geneva; (8) the prefectorates of Annecy and Chambéry (Savoy). By the same article she secured all the German enclaves in Alsace, Avignon, the Venaissin and Montbéliard. Art. VI. secured Holland to the house of Nassau, with an addition of territory, not defined in this instrument; asserted the independence, and right to federate of the German states, and the full sovereignty of all the states of Italy outside of the Italian dominions of Austria. Art. VII. gave Malta to Great Britain. By Art. XV. France was to retain two-thirds of all warships and naval stores existing in ports which had belonged to the empire of Napoleon, but were outside the borders of France, with exception of the Dutch ships. Arts. XVIII. to XXX. dealt with pecuniary claims, return of documents, renunciation of all claims for compensation, &c. By Art. XXXII. the powers bind themselves to meet at Vienna within two months to arrange a final settlement of Europe. Additional articles provided for the settlement of territorial claims that had been grandly ignored by the abrogation of treaties signed with Prussia since the Peace of Basel. By her additional article with Great Britain, France undertook to suppress the slave trade within five years, and to help to bring about its general suppression.

The separate and secret articles of the treaty (or "Secret Treaty" as they are commonly called), were meant to bind France to agree in principle to the readjustments and allotments of territory and population to be made at the approaching Congress of Vienna (q.v.).

The treaties of the 20th of November 1815 and their dependent instruments, were signed in very different circumstances. The representative of France was the duc de Richelieu; Great Britain was represented by Castlereagh and Wellington; Austria by Metternich and Count Wessenberg; Prussia by Hardenberg and W. von Humboldt; Russia by Rasumovski and Capo d'Istria. The preamble stated the altered spirit and purpose of the Allies. It insisted that, as the powers had saved France and Europe from Napoleon's last adventure, they were entitled to compensation and security for the future. They had decided to exact indemnities, partly pecuniary and partly territorial, for such damage as was signed in Paris by Great Britain, Austria, Russia and Prussia. It contained six articles. The first declared the determination of the Allies to enforce the treaty signed with France; the second, third and fourth reaffirmed their determination to exclude the Bonaparte family from the throne, and specified the measures they were prepared to take to support one another. The fifth declared that the alliance for the purposes stated would continue when the five years' occupation of France was ended. The sixth article stated that in order to facilitate and assure the execution of the present treaty, the High Contracting Parties had decided to hold periodical meetings of the sovereigns or their ministers, for the examination of such measures as appeared to be salutary for the repose and prosperity of their peoples and the maintenance of the peace of Europe. It was in accordance with this last article that the congresses of Aix-la-Chapelle (1818), Troppau (1820), Laibach (1821), and Verona (1822) were held (see Europe: History).

BIBLIOGRAPHY.—See Sir E. Hertlet, The Map of Europe by Treaties, i. (London, 1875), and Martens, Nouveau recueil de traités, &c., ii. (Göttingen, 1818).
churches within the *parochia* were served by itinerant presbyters. Towards the close of the 4th century it had become usual for the bishops to appoint regional presbyters to defined districts or territories, to which the term "parish" came gradually to be applied (see also *Diocese*). Parish, in English ecclesiastical law, may be defined as the township or cluster of townships which was assigned to the ministration of a single priest, to whom its tithes and other ecclesiastical dues were paid; but the word has now acquired several distinct meanings.

**The Old Ecclesiastical Parish.**—In the absence of evidence to the contrary, the ecclesiastical parish is presumed to be composed of a single township or vill, and to be conterminous with the manor within the ambit of which it is comprised. Before the process of subfeudation became prevalent, the most ancient manors were the districts which we call by that name when speaking of the tenants, or "townships" when we regard the inhabitants, or "parishes" as to matters ecclesiastical.

The parish as an institution is in reality later in date than the township. The latter has been in fact the unit of local administration ever since England was settled in its several states and kingdoms; the beginnings of the parochial system in England are attributed to Theodore of Tarsus, who was archbishop of Canterbury towards the close of the 7th century. The system was extended in the reign of Edgar, and it appears not to have been complete until the reign of Edward III. It has been considered that the intimate connexion of church and state militates against the view that the parochial system was founded as a national institution, since any legislation on the subject of the township and parochial systems would probably have resulted in the merging of the one into the other. The fact that the two systems, the parish and the township, have existed for more than a thousand years side by side, identical in area and administered by the same persons, and yet separate in character and machinery, is a sufficient proof that no legislative act could have been needed in the first place; nor was there any lay council of the whole nation which could have sanctioned such a measure (Stubb's *Const. Hist.* i. 227). The boundaries of the old ecclesiastical parishes are usually identical with those of the township or townships comprised within its precinct; they are determined by usage, in the absence of charters or records, and are evidenced by perambulations, which formerly took place on the "gang-days" in Rogation week, but are now, where they still survive, for the most part held triennially, the Poor-Law Act of 1844 permitting the parish officers to charge the expense on the poor-rate, "provided the perambulations do not occur more than once in three years." The expense of preserving the boundary by land-marks or bound-stones is chargeable to the same rate. Many parishes contain more than one township, and this is especially the case in the northern counties, where the separate townships are organized for administrative purposes under an act passed in 1662. In the southern and midland districts the parishes are for the most part subdivided into hamlets, other local divisions known as "ranks," "barton," and the like; the distinction between a parish and a subordinate district lies chiefly in the fact that the latter will be found to have never had a church or a constable to itself. The select committee of 1873, appointed to inquire into parochial boundaries, reported to the effect that the parish bears no definite relation to any other administrative area, except indeed to the poor-law union. It may be situated in different counties or hundreds, and in many instances it contains, in addition to its principal district, several outlying portions intermixed with the lands in other parishes.

After the abolition of compulsory church rates in 1868 the old ecclesiastical parish ceased to be of importance as an instrument of local government. Its officers, however, have still important duties to perform. The rector, vicar or incumbent is a corporation sole, in whom is vested the freehold of the church and churchyard, subject to the parishioners' rights of user; their rights of burial have been enlarged by various acts. The churchwardens are the principal lay officers. Their duties consist in keeping the church and churchyard in repair and in raising a voluntary rate for the purpose to the best of their power; they have also the duty of keeping order in church during divine service. The other officials are the parish clerk and sexton. They have freeholds in their offices and are paid by customary fees. The office of the clerk is regulated by an act of 1844, enabling a curate to undertake its duties, and providing facilities for vacating the office in case of misconduct. The only civil function of the parish clerk remaining in 1894 was the custody of maps and documents, required to be deposited with him under standing orders of parliament before certain public works were begun. By the Local Government Act 1894 they are now deposited with the chairman or clerk of a parish council.

**The New Ecclesiastical Parish.**—Under the powers given by the Church Building Acts, and acts for making new parishes, many populous parishes have been subdivided into smaller ecclesiastical parishes. This division has not affected the parish in its civil aspect.

**The Civil Parish.**—For purposes of civil government the term "parish" means a district for which a separate poor-rate is or can be made, or for which a separate overseer is or can be appointed; and by the Interpretation Act 1889 this definition is to be used in interpreting all statutes subsequent to 1866, except where the context is inconsistent therewith. This district may of itself constitute a poor law union; but in the great majority of cases the unions, or areas under the jurisdiction of boards of guardians according to the Poor-Law Amendment Act of 1834, are made up of aggregated poor-law parishes. Each of these poor-law parishes may represent the extent of an old ecclesiastical parish, or a township separately rated by custom before the practice was stayed in 1810 or separate from a large parish under the act of 1692, or it may represent a chapelry, tything, borough, ward, quarter or hamlet, or other subdivision of the ancient parish, or, under various acts, an area formed by the merger of an extra-parochial area with an adjoining district by the union of detached portions with other parishes, or by the subdivision of a large parish for the better administration of the relief of the poor. The civil importance of the poor-law parishes may be dated from the introduction of the poor law by the statute of 43 Elizabeth, which directed overseers of the poor to be appointed in every parish, and made the churchwardens into *ex officio* overseers. The statute was preceded by tentative provisions of the same kind enacted in the reigns of Edward VI. and Mary and in the fifth year of Elizabeth, and after several renewals was made perpetual in the reign of Charles I. The chief part of the parochial organization was the vestry-meeting. It derived its name from the old place of assembly, the vestry room attached to the church or chapel. The vestry represented the old assembly of the township, and retained so much of its business as had not been insensibly transferred to the court-baron and court-leet. The freemen, now appearing as the ratepayers, elected the "parish officers," as the churchwardens and waywardens, the assessors, the overseer; and (if required by act) paid assistant overseers, a secretary or vestry-clerk. The vestry took cognizance of rates if the guardians applied for his appointment. Common vestries were meetings of all the ratepayers assembled on a three days' notice; select vestries were regulated by local custom, or derived their power from the Vestries Act 1831 (Hobhouse's Act). The vestries could adopt various acts, and appoint persons to carry those acts into execution. The Local Government Act 1894 restored the parish to its position as the unit of local government by establishing parish councils. (See ENGLAND: Local Government.)

**The Parish in Scotland.**—There can be little doubt that about the beginning of the 13th century the whole, or almost the whole, of the land of Scotland was divided into ecclesiastical parishes, when the *parochia* seems probable (though the point is obscure) that the bishops presided at the first formation of the parishes—the parish being a subdivision of the *diocese*—and at any rate down to the date of the Reformation they exercised the power of creating new parishes within their respective dioceses (Duncan, *Parochial Law*, p. 4). After the Reformation the power of altering parishes was assumed by the legislature. The existing parochial districts being found unsuited to the ecclesiastical requirements of the time, a general
act was passed in 1851, which made provision for the parochial clergy, and, inter alia, directed that "a sufficient and competent district should be appropriated to each church as a parish (1851, cap. 100). Thereafter, by a series of special acts in the first place, and, subsequently, in 1861, by a series of acts creating parochial districts, the creation of suitable parochial districts was proceeded with. In the year 1707 the powers exercised by the commissioners were permanently transferred to the court of session, whose judges were appointed to the future "commissioners for the Peace, Profits, and Valuation of Teinds" (Act, 1707, cap. 9). Under this statute the areas of parishes continued to be altered and defined down to 1842, when the act commonly known as Graham's Act was passed (7 & 8 Vict. c. 44). This act, which applied to the disjunction and erection of more parochial (i.e. for all purposes, civil and ecclesiastical) and ecclesiastical parishes. This division is expressed in legal language by the terms, parishes quaod omnium (i.e. quaod civilia et sacra) and parishes quaod saeculis, the latter being augmented with the manse and glebe, to be held by him for himself and his successors in office, and along with the kirksession he administers church ordinances and exercises church discipline. The oldest government was concerned with the churchyard and the manse and glebe of the minister. The power to assess under the Parochial Buildings Acts of 1862 and 1866. Kirksession and heritors were the educational authority until the establishment of school boards in 1872. (2) Quaod Sacra Parishes.—Under Graham's Act, above mentioned, a parish may be disjoined and erected quaod sacra tantum on the application of persons who have built and endowed a church, and who offer securities for its proper maintenance. By the Education Act of 1872 the quaod sacra parishes were adopted into the system of parish education. (3) Ecclesiastical Parishes.—For sanitary purposes, highways and some others, certain classes of burghs were made separate areas from the parishes in which they lay. This fact created a set of incomplete parishes, called remoter parishes, and would have been more desirable if, instead of Annexed Parishes. This division of parishes depends, as the names imply, upon local character and situation of the parochial districts. The importance of which arose in connection with the local government, was the parish, a parish board. The Local Government (Scotland) Act 1894 reformed parish government, although not to the same extent as the corresponding English act. It established a local government board for the parish, and a parish council. The parish council has abolished all parochial boards. The number of councillors for a parish council was fixed at not less than five nor more than thirty-one, the number being determined, in the case of landward parishes, by the number of population in the parish, and in the case of town parishes, by the council and, in the case of mixed parishes, by county and town councils jointly.

The Parish in the United States.—The term "parish" is not in use as a territorial designation except in Louisiana, the sixty parishes of which correspond to the counties of the other states of the Union. In the American Episcopal Church the word is frequently used to denote an ecclesiastical district. Authorities.—The principal records from which information may be gained as to the oldest parochial system in England are the records called Nomina villarum, the Taxatio popae Nicolai made in 1291, the Nonarum inquisitiones relating to assessments made upon the clergy, the Valor ecclesiasticus of Henry VIII, the lay subsidies from the reign of Edward III to that of Charles II, the hearth-tax assessments and the land-tax accounts. On the subject of the parish generally see Stubbs's Constitutional History; Glen's Parish Law; Steer's Parish Law; Todman Smith's work on the Parish System (1836); J. B. Balfour's Parochial Administration and the Local Government Act; O. R. Hitchcock, Rise of the Parochial System in England (1895). For fuller information regarding the Scottish parish see Connell on Teinds; Duncan's Parochial Administration; Local Government in Scotland; Forbes on Registration and Taxation in the United Kingdom (1882); Goudy and Smith's Local Government in Scotland; Atkinson, Local Government in Scotland.

PARISITE, a rare mineral, consisting of cerium, lanthanum, didymium and calcium fluo-carbonate, (CeF)3(CaCO3). It is found only as crystals, which belong to the hexagonal system and usually have the form of acute double pyramids terminated by the basal planes; the faces of the hexagonal pyramids are striated horizontally, and parallel to the basal plane there is a perfect cleavage. The crystals are hair-brown in colour and are translucent. The hardness is 4.5 and the specific gravity 4.36. Light which has traversed a crystal of parisite exhibits a characteristic absorption spectrum. By the site of the complex, the one known occurrence of the mineral was in the famous emerald mine at Muio in Colombia, South America; where it was found by J. J. Paris, who re-discovered and worked the mine in the early part of the 19th century; here it is associated with emerald in a bituminous limestone of Cretaceous age (see EMERALD).

Closely allied to parisite, and indeed first described as such, is a mineral from the nepheline-syenite district of Johnshaven in South Greenland. To this the name synchysite (from Gr. συνχυσία, confounding) has been given. The crystals are rhombohedral (as distinct from hexagonal; they have the composition CeF3Ca(CO3)2, and specific gravity 2.90. At the same locality there is also found a barium-parisite, which differs from the Colombian parisite in containing barium in place of calcium, the formula being (CeF)3Ba(CO3)2; this is called cordylite with the club-shaped form (sphodin, a club) of its hexagonal crystals. Bastnæite is a cerium, lanthanum, and didymium fluo-carbonate (CeF3), from Bastnæ, near Riddarhyttan, in Westmanland, Sweden, and the Pike's Peak region in Colorado, U.S.A.

PARK, EDWARDS AMASA (1808-1900), American Congregational theologian, was born in Providence, Rhode Island, on the 20th of December 1808, the son of Calvin Park (1774-1847), a Congregational minister, professor from 1804 to 1825 at Brown University, and pastor at Stoughton, Massachusetts, in 1826-1836. The son graduated at Brown University in 1826, was a teacher at Brantree for two years, and in 1831 graduated from Andover theological seminary. He was co-pastor (with R. S. Storrs) of the orthodox Congregational church of Brantree in 1831-1833; professor of mental and moral philosophy at Amherst in 1835; and Bartlett professor of sacred rhetoric (1836-1847), and Abbot professor of Christian theology (1847-1861) at Andover. He died at Andover on the 10th of June 1891, in his 84th year. Edwards, whose great-grand-daughter he married, Park was one of the most notable American theologians and orators. He was the most prominent leader of the "new school" of "New England Theology." He left his theological impress on the Bibliotheca sacra, which he and Bela B. Edwards took over in 1844 from Edward Robinson, who had founded it in 1843, and of which Park was assistant editor until 1851 and editor-in-chief from 1851 to 1884. As a general statement of the position of orthodox Congregationalism he drew up and annotated the "Associate Creed of Andover Theological Seminary" (1883), and the anonymously published "Worcester Creed" of 1884 was his popularized and simplified statement. He edited in 1866 The Atonement, a collection of essays by various hands, prefaced by his study of the "Rise of the Edwardian Theory of the Atonement." Dr Park's sermon, "The Theology of the Intellect and that of the Feelings," delivered in 1850 before the convention of the Congregational ministers of Massachusetts, and published in the Bibliotheca sacra of July 1850,
was the cause of a long and bitter controversy, metaphysical rather than doctrinal, with Charles Hodge. Some of Park's sermons were published in 1835, under the title Discourses on Some Theological Doctrines as Related to the Religious Character. With Austin Phelps and Lowell Mason he prepared The Sabbath Hymn Book (1838).

See Professor Park and His Pupils (Boston, 1899), a memorial of his 90th birthday, with articles by R. S. Storrs, G. R. W. Scott, Joseph Cook, G. Frederick Wright and others.

PARK, MUNGO (1771-1806), Scottish explorer of the Niger, was born in Selkirkshire, Scotland, on the 20th of September 1771, at Foulshields on the Yarrow—the farm which his father rented from the duke of Buccleuch. He was the seventh in a family of thirteen. Having received a good education, he was apprenticed to a surgeon named Thomas Anderson in Selkirk, and then attended the university of Edinburgh for three sessions (1789-1791), obtaining the surgical diploma. By his brother-in-law, James Dickson, a botanist of repute, he was introduced to Sir Joseph Banks, then president of the Royal Society, and through his good offices obtained the post of assistant-surgeon on board the "Worcester" East Indiaman. In 1792 he joined the 90th Regiment in Sumatra, and on his return in 1793 he contributed a description of eight new Sumatran fishes to the Transactions of the Linnean Society.

Park in 1794 offered his services to the African Association, then looking out for a successor to Major Daniel Houghton, who had been sent out in 1790 to discover the course of the Niger and had perished in the Saharan. Supported by the influence of Sir Joseph Banks, Park was successful in his application. On the 21st of June 1795 he reached the Gambia and ascended that river 200 miles to a British trading station named Pisania. On the 2nd of December, accompanied by two negro servants, he started for the unknown interior. He chose the route crossing the upper Senegal basin and through the semi-desert region of Kaarta. The journey was full of difficulties, and at Ludamar he was imprisoned by a Moorish chief for four months. He escaped, alone and with nothing save his horse and a pocket compass, on the 1st of July 1796, and on the 21st of the same month reached the long-sought Niger at Segu, being the first European to gaze on its waters. He followed the river down stream 80 m., to Silla, where he was obliged to turn back, being without means and utterly exhausted. On his return journey, begun on the 30th of July, he took a route more to the south than that originally followed, keeping close to the Niger as far as Banako, thus tracing the course of that stream in all for some 300 miles. At Kamalla he fell ill, and owed his life to the kindness of a negro in whose house he lived for seven months. Eventually he reached Pisania again on the 10th of June 1797, returning to England by way of America on the 22nd of December. He had been thought to be dead, and his return home with the news of the discovery of the Niger evoked great public enthusiasm. An account of his journey was at once drawn up for the African Association by Bryan Edwards, and a detailed narrative from his own pen appeared in 1799 (Travels in the Interior of Africa). Abundance of incident and an unaffected style rendered the work extremely popular, and it still holds its place as an acknowledged classic in this department of literature.

Settling at Foulshields, Park in August 1799 married a daughter of his old master, Thomas Anderson. Two offers made to him to go to New South Wales in some official capacity came to nothing, and in October 1801 Park removed to Peebles, where he practised as a doctor. In the autumn of 1803 he was invited by the government to lead another expedition to the Niger. Park, who chafed at the hardness and monotony of life at Peebles, accepted the offer, but the start of the expedition was delayed. Part of the waiting time was occupied in the perfecting of his Arabic—his teacher being Sidi Ambak Bubi, a native of Mogador; whose vagaries both amused and alarmed the people of Peebles. In May 1804 Park went back to Foulshields, where he made the acquaintance of Sir Walter Scott, then living near by at Ashenstein, with whom he soon became on terms of warm friendship. In September he was summoned to London to leave on the new expedition; he parted from Sir Walter with the hopeful proverb on his lips, "Freits (omens) follow those that look to them." Park had at that time adopted the theory that the Niger and the Congo were one, and in a memorandum drawn up before he left England he wrote: "My hopes of returning by the Congo are not altogether fanciful." He sailed from Portsmouth for the Gambia on the 31st of January 1805, having been given a captain's commission as head of the government expedition. Alexander Anderson, his brother-in-law, was second in command, and on him was bestowed a lieutenantcy. George Scott, a fellow Borderer, was draughtsman, and the party included four or five artificers. At Goree (then in British occupation) Park was joined by Lieutenant Martyrn, R.A., thirty-five privates and two seamen. The expedition did not reach the Niger until the middle of August, when only eleven Europeans were left alive; the rest had succumbed to fever or dysentery. From Bambak the journey to Segu was made by canoe. Having received permission from the ruler of that town to proceed, at Sansandig, a little above Segu, Park reached the unknown part of the river. Park, helped by one soldier, the only one left capable of work, converted two canoes into one tolerably good boat, 40 ft. long and 6 ft. broad. This he christened H.M. schooner "Joliba" (the native name for the Niger), and in it, with the surviving members of his party, he set sail down stream on the 10th of November. At Sansandig, on the 28th of October, Anderson had died, and in him Park lost the only member of the party—except Scott, already dead—who had been of real use. Those who embarked in the "Joliba" were Park, Martyrn, three European soldiers (one mad), a guide and three slaves. Before his departure Park gave to Isaco, a Mandingo guide who had been with him thus far, letters to take back to the Gambia for transmission to England. The spirit with which Park began the final stage of his enterprise is well illustrated by his letter to the head of the Colonial Office: "I shall," he wrote, "set sail for the east with the fixed resolution to discover the termination of the Niger or perish in the attempt . . . though all the Europeans who are with me should die, and though I were myself half dead, I would still persevere, and if I could not succeed in the object of my journey, I would at least die on the Niger."

To his wife he wrote stating his intention not to stop nor land anywhere till he reached the coast, where he expected to arrive about the end of January 1806. These were the last communications received from Park, and nothing more was heard of the party until reports of disaster reached the settlements on the Gambia. At length the British government engaged Isaco to go to the Niger to ascertain the fate of the explorer. At Sansandig Isaco found the guide who had gone down stream with Park, and the substantial accuracy of the story he told was later confirmed in the investigations of Hugh Clapperton and Richard Lander. This guide (Amadi) stated that Park's canoe descended the river to Yauri, where he (the guide) landed. In this long journey of about 1000 miles Park, who had plenty of provisions, stuck to his resolution of keeping aloof from the natives. His party reached Yauri; and at various other places the natives came out in canoes and attacked his boat. These attacks were all repulsed, Park and his party having plenty of firearms and ammunition and the natives having none. The boat also escaped the many perils attendant on the navigation of an unknown stream strewn with many rapids—Park had built the "Joliba" so that it drew only a foot of water. But at the Bussa rapids, not far below Yauri, the boat struck on a rock and remained fast. On the bank they gathered hostile natives, who attacked the party with bow and arrow and throwing spears. Their position being untenable, Park, Martyrn, and the two soldiers who still survived, sprang into the river and were drowned. The sole survivor was one of the slaves, from whom was obtained the story of the final scene. Isaco, and later Lander, obtained some of Park's effects, but
his journal was never recovered. In 1827 his second son, Thomas, landed on the Guinea coast, intending to make his way to Bussa, where he thought his father might be detained a prisoner, but after penetrating some little distance inland he died of fever. Park’s widow died in 1840.

J. Thomson’s Mungo Park and the Niger (London, 1890) contains the best critical estimate of the explorer and his work. See also The Life (by Wishaw) prefixed to Journal of a Mission into the Interior of Africa in 1805 (London, 1815); H. B., Life of Mungo Park (Edinb., 1835); and an interesting passage in Lockhart’s Life of Sir Walter Scott, vol. ii.

PARK—PARKER, J. H.

In 1874 he was made post-captain. During the latter part of the Seven Years’ War he served in the East Indies, taking part in the capture of Pondicherry (1761) and of Manila (1762). In the latter year Parker with two ships captured one of the valuable Spanish plate ships in her voyage between Acapulco and Manila. In 1778 he became rear-admiral, and went to North American waters as second-in-command. For some time before Rodney’s arrival he was in command on the Leeward Islands station, and conducted a skilful campaign against the French at Martinique. In 1781, having returned home and become vice-admiral, he fell in with a Dutch fleet of about his own force, though far better equipped, near the Dogger Bank (Aug. 5). After a fiercely contested battle, in which neither combatant gained any advantage, both sides drew off. Parker considered that he had not been properly equipped for his task, and insisted on resigning his command. In 1782 he accepted the East Indies command, though he had just succeeded to the family baronetcy. On the outward voyage his flagship, the “Cato” (60), was lost with all on board.

His second son, Admiral Sir Hyde Parker (1739-1807), entered the navy at an early age, and became lieutenant in 1758, having passed most of his early service in his father’s ships. Five years later he became a post-captain, and from 1766 onwards for many years he served in the West Indies and in North American waters, particularly distinguishing himself in breaking the defences of the North river (New York) in 1776. His services on this occasion earned him a knighthood in 1779.

PARKER, JOHN (1866-1884), English writer on architecture, the son of a London merchant, was born on the 1st of March 1866. He was educated at Manor House School, Chiswick, and in 1882 entered business as a bookseller. Succeeding his uncle, Joseph Parker, as a bookseller at Oxford in 1832,
he conducted the business with great success, the most important of the firm's publications being perhaps the series of the "Oxford Pocket Classics." In 1836 he brought out his Glossary of Architecture, which, published in the earlier years of the Gothic revival in England, had considerable influence in extending the movement, and supplied a valuable help to young architects. In 1848 he edited the fifth edition of Rickman's Gothic Architecture, and in 1849 he published a handbook based on his earlier volume and entitled Introduction to the Study of Gothic Architecture. The completion of Hudson Turner's Domestic Architecture of the Middle Ages next engaged his attention, three volumes being published (1853-1860). In 1858 he published Medieval Architecture of Chester. Parker was one of the chief advocates of the "restoration" of ecclesiastical buildings, and published in 1866 Architectural Antiquities of the City of Wells. Latterly he devoted much attention to explorations of the history of Rome by means of excavations, and succeeded in satisfying himself of the historical truth of much usually regarded as legendary. Two volumes of his Archaeology of Rome were published at Oxford in 1874 and 1876. In recognition of his labours he was decorated by the king of Italy, and received a medal from Pope Pius IX. In 1869 he endowed the keepership of the Ashmolean Museum with a sum yielding £250 a year, and under the new arrangement he was appointed the first keeper. In 1871 he was made C.B. He died at Oxford on the 31st of January 1884.

PARKER, JOSEPH (1830-1902), English Nonconformist divine, was born at Hexham-on-Tyne on the 9th of April 1830, his father being a stonemason. He managed to pick up a fair education, which in after-life he constantly supplemented.

In the revolutionary years from 1845 to 1850 young Parker as a local preacher and temperance orator gained a reputation for vigorous utterance. He was influenced by Thomas Cooper, the Chartist, and Edward Miill, the Liberalist, and was much associated with Joseph Cowen, afterwards M. P. for Newcastle. In the spring of 1852 he wrote to Dr John Campbell, minister of Whitefield Tabernacle, Moorfields, London, for advice as to entering the Congregational ministry, and after a short probation he became Campbell's assistant. He also attended lectures in logic and philosophy at University College, London. From 1853 to 1858 he was pastor at Banbury. His next charge was at Cavendish Street, Manchester, where he rapidly made himself felt as a power in English Nonconformity. While here he published a volume of lectures entitled Church Questions, and, anonymously, Ecc Deo (1868), a work provoked by Sceley's Ecce Homo. The University of Chicago conferred on him the degree of D.D. In 1869 he returned to London as minister of the Poultry church, founded by Thomas Goodwin. Almost at once he began the scheme which resulted in the erection of the great City Temple in Holborn Viaduct. It cost £70,000, and was opened on the 19th of May 1874. From this centre his influence spread far and wide. His stimulating and original sermons, with their notable leaning towards the use of a racy vernacular, made him one of the best known personalities of his time. Dr Parker was twice chairman of the London Congregational Board and twice of the Congregational Union of England and Wales. The death of his second wife in 1890 was a blow from which he never fully recovered, and he died on the 28th of November 1902.

Parker was pre-eminently a preacher, and his published works are chiefly sermons and expositions, chief among them being City Temple Sermons (1866-1876) and The People's Bible, in 25 vols. (1889). The works included in the volumes include: Westminster Abbey (1866), The Inner Life of Christ (1881), Apostolic Life (1884), Tyne County: My Life and Teaching (1883; new ed., 1889), A Preacher's Life (1899).

See E. C. Pilkington, Dr Parker and his Friends (1905); Congregational Year-Book (1904).

PARKER, MARTIN (c. 1600-c. 1656), English ballad writer, was probably a London tavern-keeper. About 1625 he seems to have begun publishing ballads, a large part of which bearing his signature or his initials, "M.P.," are preserved in the British Museum. Dryden considered him the best ballad writer of his time. His sympathies were with the Royalist cause during the Civil War, and it was in support of the declining fortunes of Charles I. that he wrote the best known of his ballads, "When the King enjoys his own again," which he first published in 1643, and which, after enjoying great popularity at the Restoration, became a favourite Jacobite song in the 18th century. Parker also wrote a naval ballad, "Sailors for my Money," which in a revised version survives as "When the stormy winds do blow." It is not known when he died, but the appearance in 1656 of a "funeral elegy," in which the ballad writer was satirically celebrated is perhaps a correct indication of the date of his death.

PARKER, MATTHEW (1504-1575), archbishop of Canterbury, was the eldest son of William Parker, a citizen of Norwich, where he was born, in St Saviour's parish, on the 6th of August 1504. His mother's maiden name was Alice Monins, and a John Monins married Cranmer's sister Jane, but no definite relationship between the two archbishops has been traced. William Parker died about 1516, and his widow married a certain John Baker. Matthew was sent in 1522 to Corpus Christi College, Cambridge, where he became a fellow. Most of his biographers, including (Curse) and Cecil, was only two years old when Parker went to Cambridge. He graduated B.A. in 1525, was ordained deacon in April and priest in June 1527, and was elected fellow of Corpus in the following September. He commenced M.A. in 1528, and was one of the Cambridge scholars whom Wolsey wished to transplant to his newly founded Cardinal College at Oxford. Parker, like Cranmer, declined the invitation. He had come under the influence of the Cambridge reformers, and after Anne Boleyn's recognition as queen he was made her chaplain. Through her he was appointed dean of the college of secular canons at Stoke-by-Clare in 1535. Latimer wrote to him in that year urging him not to fall short of the expectations which had been formed of his ability. In 1537 he was appointed chaplain to Henry VIII., and in 1538 he was threatened with prosecution by the reactionary party. The bishop of Dover, however, reported to Cromwell that Parker "hath ever been of a good judgment and set forth the Word of God after a good manner. For this he suffers some grudge." He graduated D.D. in that year, and in 1541 he was appointed to the second professorship of moral philosophy at Oxford. Latimer is on Henry VIII.'s recommendation he was elected master of Corpus Christi College, and in 1545 vice-chancellor of the university. He got into some trouble with the chancellor, Gardiner, over a ribald play, "Pammachius," performed by the students, deriding the old ecclesiastical system, though Bonner wrote to Parker of the assured affection he bore him. On the passing of the act of parliament in 1545 enabling the king to dissolve chantries and colleges, Parker was appointed one of the commissioners for Cambridge, and their report saved its colleges if there had ever been any intention to destroy them. Stoke, however, was dissolved in the following reign, and Parker received a pension equivalent to £400 a year in modern currency. He took advantage of the new reign to marry in June, 1547, before clerical marriages had been legalized by parliament and convocation, Margaret, daughter of Robert Harlestone, a Norfolk squire. Duing Kett's rebellion he was allowed to preach in the rebels' camp on Mousehold Hill, but without much effect; and later on he encouraged his chaplain, Alexander Neville, to write his history of the rising. His Protestantism advanced with the times, and he received higher promotion under Northumberland than under the moderate Somerset. Bucer was his friend at Cambridge, and he preached Bucer's funeral sermon in 1551. In 1552 he was promoted to the rich deanship of Lincoln, and in July 1553 he supped with Northumberland at Cambridge, when the duke marched north on his hopeless campaign against Mary.
PARKER, S.—PARKER, T.

829

As a supporter of Northumberland and a married man, Parker was naturally deprived of his deanship, his mastership of Corpus, and his other preferments. But he found means to live in England throughout Mary’s reign without further molestation. He was not cast in a heroic mould, and he had no desire to figure at the stake; like Cecil, and Elizabeth herself, he had a great respect for authority, and when his time came he could consistently impose authority on others. He was not eager to assume this task, and he made great efforts to avoid promotion to the archbishopric of Canterbury, which Elizabeth designed for him as soon as she had succeeded to the throne. He was elected on the 1st of August 1559; but it was difficult to find the requisite four bishops willing and qualified to consecrate him, and not until the 17th of December did Barlow, Scory, Cowderal and Hodgkins perform that ceremony at Lambeth. The legend of an indecent consecration at the Nag’s Head tavern in Fleet Street seems first to have been printed by the Jesuit, Christopher Holywood, in 1603; and it has long been abandoned by reputable controversialists. Parker’s consecration was, however, only made legally valid by the plenitude of the royal supremacy; by the Edwardine Ordinal, which was used, had been repealed by Mary and not re-enacted by the parliament of 1559.

Parker owes his fame to circumstances rather than to personal qualifications. This wise moderation of the Elizabethan settlement, which had been effected before his appointment, was obviously not due to him; and Elizabeth could have placed Knox or Bonner in the chair of St Augustine had she been so minded. But she wanted a moderate man, and so she chose Parker. He possessed all the qualifications she expected from an archbishop except cельbacy. He distrusted popular enthusiasm, and he wrote in horror of the idea that “the people” should be the reformers of the Church. He was not inspiring as a leader of religion; and no dogma, no original theory of church government, no prayer-book, not even a tract or a hymn is associated with his name. The 56 volumes published by the Parker Society include only one by its eponymous hero, and that is a volume of correspondence. He was a disciplinarian, a scholar, a modest and moderate man of genuine piety and irreproachable morals. His historical research was exemplified in his De antiquitate ecclesiae, and his editions of Asser, Matthew Paris, Walsingham, and the compiler known as Matthew of Westminster; his liturgical skill was shown in his version of the psalter and in the occasional prayers and thanksgivings which he was called upon to compose; and he left a priceless collection of manuscripts to his college at Cambridge.

He was happier in these pursuits than in the exercise of his jurisdiction. With secular politics he had little to do, and he was never admitted to Elizabeth’s privy council. But ecclesiastical politics gave him an infinity of trouble. Many of the reformers wanted no bishops at all, while the Catholics wanted those of the old dispensation, and the queen herself grudged episcopal privilege until she discovered in it one of the chief bulwarks of the royal supremacy. Parker was therefore left to stem the rising tide of Puritan feeling with little support, and often in the company of bishops’ interpretations and further considerations, issued in 1560, tolerated a lower vestiarii standard than was prescribed by the rubric of 1559; the advertisements, which Parker published in 1566, to check the Puritan descent, had to appear without specific royal sanction; and the reformatio legum eclesiasticarum, which Foxe published with Parker’s approval, received neither royal, parliamentary nor synodal authorization. Parliament even contested the claim of the bishops to determine matters of faith. “Surely,” said Parker to Peter Wentworth, “you will refer yourselves wholly to us therein.” “No, by the faith I bear to God,” retorted Wentworth, “we will pass nothing before we understand what it is; for that were but to make you popes. Make you popes who list, for we will make you none.” Disputes about vestments had expanded into a controversy over the whole field of church government and authority, and Parker died on the 17th of May, 1572, lamenting that Puritan ideas of “governance” would “in conclusion undo the queen and all others that depended upon her.” By his personal conduct he had set an ideal example for Anglican priests, and it was not his fault that national authority failed to crush the individualistic tendencies of the Protestant Reformation.

John Srye’s Life of Parker, originally published in 1714, and re-edited for the Clarendon Press in 1821 (3 vols.), is the principal source for Parker’s life. A biographical sketch written from a different point of view was published by W. M. Kennedy in 1908. He also J. Bass Mullinger’s scholarly life in Dic. Nat. Biol.; W. M. Kennedy’s Life of Parker in Stephens and Hunt’s Church History; Srye’s Works (General Index); Gough’s Index to Parker Soc. Publ. Fuller, Burnet, Collier and R. W. Dixon’s Histories of the Church; Birt’s Elizabethan Settlement; H. Gee’s Elizabethan Clergy (1898); and Prout’s Hist. of England; and vol. vi. of Hodgkin’s Political History.

Parker, Samuel (1640–1688), English bishop, was born at Northampton, and educated at Wadham College, Oxford. His Presbyterian views caused him to move to Trinity College, where, however, the influence of the senior fellow induced him to join the Church of England, and he was ordained in 1664. In 1665 he published an essay entitled Tentamina physico-theologica de Deo, dedicated to Archbishop Sheldon, who in 1667 appointed him one of his chaplains. He became rector of Chartham, Kent, in the same year. In 1670 he became archdeacon of Canterbury, and two years after he was appointed rector of Hickam, Kent. In 1673 he was elected master of Edenbridge Hospital. His Discourse of Ecclesiastical Polite (London, 1670), advocating state regulation of religious affairs, led him into controversy with Andrew Marvell (1621–1675). James II. appointed him to the bishopric of Oxford in 1686, and he in turn forwarded the king’s policy, especially by defending the royal right to appoint Roman Catholics to office. In 1687 the ecclesiastical commission forcibly installed him as president of Magdalen College, Oxford, the following refusing to elect any of the king’s nominees. He was commonly regarded as a Roman Catholic, but he would appear to have been no more than an extreme exponent of the High Church doctrine of passive obedience. After he became president the action of the king in replacing the expelled fellows with Roman Catholics agitated him to such a degree as to hasten his end; to the priests sent to persuade him on his death-bed to be received into the Roman Church he declared that he “never had been and never would be of that religion,” and he died in the communion of the Church of England.

Parker’s second son, Samuel Parker (1681–1730), was the author of Bibliotheca biblica, or Pastrical Commentary on the Scriptures (1720–1735), an abridged translation of Eusebius, and other works. He was also responsible during 1708 and 1709 for a monthly periodical entitled Censusa temporum, or Good and Ill Tendencies of Books. He passed most of his life in retirement at Oxford. His younger son Richard founded the well-known publishing firm in Oxford.

Parker, Theodore (1810–1860), American preacher and social reformer, was born at Lexington, Massachusetts, on the 16th of August 1810, the youngest of eleven children. His father, John Parker, was a small farmer and skilled mechanic, was a typical New England Puritan, and his agricultural labours took great pains with the religious education of his children, “caring, however, but little for doctrines,” and making religion to consist of love and good works. His paternal grandfather, Captain John Parker (1779–1735), was the leader of the Lexington minute-men in the skirmish at Lexington. Theodore obtained the elements of knowledge in the schools of the district, which were open during the winter months only. During the rest of the year he worked on his father’s farm. At the age of seventeen he became himself a winter schoolmaster, and in his twentieth year he entered himself at Harvard, working on the farm as usual (until 1831) while he followed his studies and going over to Cambridge for the examinations only. For the theological course he took up in 1834 his
residence in the college, meeting his expenses by a small sum amassed by school-keeping and by help from a poor student's fund, and graduating in 1836. At the close of his college career he began his translation (published in 1843) of Wilhelm M. L. De Wette's Beiträge zur Einleitung in das Alte Testament. His journal and letters show that he had made acquaintance with a large number of languages, including Hebrew, Chaldee, Syriac, Arabic, Coptic, Ethiopic, as well as the classical and the principal modern European languages. When he entered the divinity school he was an orthodox Unitarian; when he left it, he entertained strong doubts about the infallibility of the Bible, the possibility of miracles, and the exclusive claims of Christianity and the Church. Emerson's transcendentalism greatly influenced him, and Strauss's Leben Jesu left its mark upon his thought. His first ministerial charge was over a small village parish, West Roxbury, a few miles from Boston; here he was ordained as a Unitarian clergyman in June 1837 and here he preached until January 1846. His views were slowly assuming the form which subsequently found such strong expression in his writing; but the progress was slow, and the cautious reserve of his first rationalistic utterances was in striking contrast with his subsequent rashness. But on the 10th of May 1841 he preached at Boston a sermon on "the transient and permanent in Christianity," which presented in embryo the main principles and ideas of his final theological position, and the preaching of which determined his subsequent relations to the churches with which he was connected and to the whole ecclesiastical world. The Boston Unitarian clergy denounced the preacher, and declared that the "young man must be silenced." No Unitarian publisher could be found for his sermon, and nearly all the pulpits of the city were closed against him. A number of gentlemen in Boston, however, invited him to give a series of lectures there. The result was that he delivered in the Masonic Hall, in the winter of 1841-1842, as lectures, substantially the volume afterwards published as the Discourse of Matters pertaining to Religion. The lectures in their published form made his name famous throughout America and Europe, and confirmed the stricter Unitarians in America in their attitude towards him and his supporters. His friends, however, resolved that he should be heard in Boston, and there, beginning with 1845, he preached regularly for fourteen years. Previous to his removal from West Roxbury to Boston Parker spent a year in Europe, calling in Germany upon Paulus, Gervinus, De Wette and Ewald, and preaching in Liverpool in the pulpits of James Martineau and J. H. Thom. After January 1846 he devoted himself exclusively to his work in Boston. In addition to his Sunday labours he lectured throughout the States, and prosecuted his wide studies, collecting particularly the materials for an opus magnum on the development of religion in mankind. Above all he took up the question of the emancipation of the slaves, and fearlessly advocated in Boston and elsewhere, from the platform and through the press, the cause of the negroes. He made his influence felt also by correspondence with political leaders and by able political speeches, one of which, delivered in 1858, contained the sentence, "Democracy is direct self-government, over all the people, by all the people, for all the people," which probably suggested Abraham Lincoln's oft-quoted variant. Parker assisted actively in the escape of fugitive slaves, and for trying to prevent the rendition of perhaps the most famous of them, Anthony Burns, was indicted, but the indictment was quashed. He also gave his aid to John Brown (q.v.). By his voice, his pen, and his utterly fearless action in social and political matters he became a great power in Boston and America generally. But his days were numbered. His mother, from whom he derived his own courage, fell a victim to the same disease. In January 1859 he suffered a violent haemorrhage of the lungs, and sought relief by retracing first to the West Indies and afterwards to Europe. He died at Florence on the 10th of May 1860.

The fundamental articles of Parker's religious faith were the three "instinctive intuitions" of God, of a moral law, and of immortality. His own mind, heart and life were undoubtedly pervaded, sustained and ruled by the feelings, convictions and hopes which he formulated in these three articles; and he rationalized his own religious conceptions in a number of expositions which do credit to his sincerity and courage. But he was a preacher rather than a thinker, a reformer rather than a philosopher.

Parker's principal works are: A Discourse of Matters pertaining to Religion (1842); Ten Sermons of Religion (1853); and Sermons of Theism, Atheism and the Popular Theology (1853). A collected edition of his works was published in England by Frances Power Cobbe and others—the Centenary edition in Boston, Mass., by the American Unitarian Association (14 vols., 1907-1911); a volume of Theodore Parker's Prayers, edited by Rufus Edgerton's and Matilda Goddard, was published in America in 1861; and a volume of Parker's West Roxbury Sermons, with an historical sketch by Frank B. Sanborn, was published in Boston, Mass., in 1892. A German translation of part of his works was made by Ziehten (Leipzig 1854-1857).

The best biographies are John Weis's Life and Correspondence of Theodore Parker (New York, 1864); O. E. Frothingham’s Theodore Parker: A Biography (Boston, 1874); and John White Chadwick's Theodore Parker, Preacher and Reformer (Boston, 1900), the last containing a good bibliography. Valuable reviews of Parker's theological position and of his character and work have appeared—by James Martineau, in the National Review (April 1860), and J. H. Thom, in the Theological Review (March 1864).

PARKERSBURG, a city and the county-seat of Wood county, West Virginia, U.S.A., on the Ohio river, at the mouth of the Little Kanawha, about 95 m. below Wheeling. Pop. (1890), 8,508; (1900), 11,703, of whom 515 were foreign-born and 783 were negroes; (1910 census), 17,842. Parkersburg is served by the Baltimore & Ohio, the Baltimore & Ohio Southwestern, and the Little Kanawha railways, by electric railway to Martinsville, Ohio, and by passenger and freight boats to Pittsburgh, Cincinnati, intermediate ports, and ports on the Little Kanawha. Parkersburg is the see of a Protestant Episcopal Bishop. The Ohio River forms the boundary of the city and is the principal river of the neighboring region, and the city is engaged in the refining of oil and the manufacture of pottery, brick and tile, glass, lumber, furniture, flour, steel, and foundry and machine-shop products. In 1905 the value of the factory products was $1,778,139 (21.9% more than in 1900). Parkersburg was settled in 1780, was incorporated in 1820, and received a new charter in 1903, when its boundaries were enlarged. About 2 m. below the city is the island which was the home of Harman Blennerhassett (q.v.) and bears his name.

PARKES, SIR HARRY SMITH (1828-1885), English diplomatist, son of Harry Parkes, founder of the firm of Parkes, Otway & Co., ironmasters, was born at Birchills Hall, near Walsall in Staffordshire, in 1828. When but four years old his mother died and in the following year his father was killed in a carriage accident. Being thus left an orphan, he found a home with the uncle, a hired naval officer, at Birmingham. He received his education at King Edward's Grammar School. In 1837 his uncle died, and in 1841 he sailed for Macao in China, to take up his residence at the house of his cousin, Mrs Gutfalz. At this time what was known as the "Opium War" had broken out, and Parkes eagerly prepared himself to take part in the events which were passing around him by diligently applying himself to the study of Chinese. In 1842 he received his first appointment in the consular service. Fortunately for him, he was privileged to accompany Sir Henry Pottinger in his expedition up the Yangtsze-kiang to Nanking, and after having taken part in the capture of Chinkiang and the surrender of Nanking, he witnessed the signing of the treaty on board the "Cornwallis" in August 1842. By this treaty the five ports of Canton, Amoy, Fuchow, Ningpo and Shanghai were opened to trade. After short residences at Canton and the newly opened Amoy, Parkes returned to Peking, where he was posted. Here he served under Mr (afterwards Sir) Rutherford Alcock, who was one of the few Englishmen who knew how to manage the Chinese. In 1849 he returned to England on leave, and after visiting the Continent and doing some hard work for the foreign office he returned to China in 1851. After a short stay
at Amoy as interpreter he was transferred in the same capacity to Canton. In May 1854 he was promoted to be consul at Amoy, and in 1855 was chosen as secretary to the mission to Bangkok, being largely instrumental in negotiating the first European treaty with Siam. In June 1856 he returned to Canton as acting consul, a position which brought him into renewed contact with Commissioner Yeh, whose insolence and obstinacy led to the second China War. Yeh had now met a man of even greater power and determination than himself, and when, in October 1856, as a climax to many outrages, Yeh seized the British lorcha "Arrow" and made prisoners of her crew, Parkes at once closed with his enemy. In response to a strongly worded despatch from Parkes, Sir John Bowring, governor of Hong-Kong, placed matters in the hands of Admiral Sir M. Seymour, who took Canton at the close of the same month but had not a sufficient force to hold it. In December 1857 Canton was again bombarded by Admiral Seymour. Parkes, who was attached to the admiral's staff, was the first man to enter the city, and himself tracked down and arrested Commissioner Yeh. As the city was to be held, an allied commission was appointed to govern it, consisting of two Englishmen, of whom one was Parkes, and a French naval officer. Parkes virtually governed this city of a million inhabitants for three years. Meanwhile the treacherous attack at Taku upon Sir Frederick Bruce led to a renewal of hostilities in the north, and Parkes was ordered up to serve as interpreter and adviser to Lord Elgin (July, 1856). In pursuance of these duties he went in advance of the army to the city of Tungchow, near Peking, to arrange a meeting between Lord Elgin and the Chinese commissioners who had been appointed to draw up the preliminaries of peace. While thus engaged he, Mr (afterwards Lord) Loch, Mr de Norman, Lord Elgin's secretary of preparation, Mr Bowby, the Times correspondent, and others, were treacherously taken prisoners (Sept. 13, 1860). Parkes and Loch were never let off to that prison, except held as a board of punishment, at Peking, where they were separately herded with the lowest class of criminals. After ten days' confinement in this den of iniquity they were removed to a temple in the city, where they were comfortably housed and fed, and from which, after a further detention, they were granted their liberty. For this signal instance of treachery Lord Elgin burned down the Summer Palace of the emperor. Towards the end of 1860 Parkes returned to his post at Canton. On the restoration (Oct. 1861) of the city to the Chinese he returned to England on leave, when he was made K.C.B. for his services; he had received the companionship of the order in 1860. On his return to China he served for a short time as consul at Shanghai, and was then appointed minister in Japan (1865). For eighteen years he held this post, and throughout that time he strenuously used his influence in support of the Liberal party of Japan. So earnestly did he throw in his lot with these reformers that he became a marked man, and incurred the bitter hostility of the reactionaries, who on three separate occasions attempted to assassinate him. In 1882 he was transferred to Peking. While in Peking his health failed, and he died of malarial fever on the 21st of March 1885. In 1866 Sir H. (then Mr) Parkes married Miss Fanny Plumer, who died in 1879. The standard Life is by Stanley Lane-Poole (1894). (R. K. D.)

PARKES, SIR HENRY (1815-1896). Australian statesman, was born at Stoneleigh, in Warwickshire, on the 27th of May 1815. The son of parents in very humble circumstances, he received only a rudimentary education, and at an early age was obliged to earn his living as a common labourer. Failing to make his way in England, he emigrated to Australia in 1839, and after a time settled in Sydney as an ivory-turner. Conscious of his great powers, he worked unremittingly to repair the deficiencies of his education, and developed a genuine taste for literature, and a gift for versification, which won him the estimation of some of the best writers as a poet and as a raconteur. His first volume of poems was published in 1842, under the title of Stolen Moments. He now began to take an active part in politics, and soon showed himself the wielder of an incisive style as a leader-writer, and a popular orator of unrivalled influence. He took a prominent part in the movement against the transportation of convicts, and in 1849 started the Empire newspaper to agitate his policy of attacking abuses while remaining loyal to the Crown. The paper at once made its mark, but owing to financial difficulties ceased to appear in 1858. One of the reforms for which Parkes fought most strenuously was the full introduction of responsible government. He was returned to the legislative council under the old constitution as member for Sydney, and on the establishment of a legislative assembly in 1856 was elected for East Sydney. His parliamentary career was twice interrupted by pecuniary embarrassments; indeed, he never acquired the art of ranking money, and in spite of a public subscription raised in 1887 died in absolute penury. He was elected for East Sydney in 1859 at the first general election under the new electoral act, and sat till 1861, when he was sent to England as a commissioner for promoting emigration. He made a prolonged stay in England, and described his Impressions in a series of letters to the Sydney Morning Herald, some of which were reprinted in 1860 under the title of Australian Views of England. He returned to Australia in 1863, and, re-entering the Assembly, became colonial secretary in the Martin ministry from 1866 to 1868. He succeeded in passing the Public Schools Act of 1866, which for the first time instituted an efficient system of primary education in the colony. His great chance came in 1872, when the Martin ministry resigned on the question of the sum payable by Victoria in lieu of border duties. Parkes had for several years persistently advocated free imports as a remedy for the financial distress of the colony. He now became prime minister and colonial secretary; and rising to the height of his opportunity, he removed the cause of dispute by throwing the colony open to trade. He held office till 1875, and on the fall of the Robertson ministry again became premier and colonial secretary from March till August 1877. At the last election he was made K.C.M.G. Finding that the state of parties did not allow of the existence of a stable ministry, he formed a coalition with Sir John Robertson, and became premier and colonial secretary for the third time from December 1878 to January 1883. In 1882 and in 1883-1884 he paid prolonged visits to England. Already distinguished among Australian statesmen for breadth of outlook and passionate devotion to the Empire, he returned with those qualities enhanced. For a time he found himself almost in a position of isolation, but in 1887 the policy of protection adopted by his successors brought him again into office. His free trade policy was once more successful. Other important measures of his administration were the reform of the civil service, the prohibition of Chinese immigration, and the railways and public works acts. He fell from office in January 1889, but in the following March became for the fifth time premier and colonial secretary. The remainder of his life was chiefly devoted to the question of Australian federation. The Federal Convention at Melbourne in 1889 was mainly his work; and he presided over the convention at Sydney in 1891, and was chiefly responsible for the draft constitution there carried. Defeated in October 1891 on his refusal to accept an eight hours' day for coal-miners, he remained in opposition for the rest of his career, sacrificing even free trade in the hope of smoothing the path of federation. He died at Sydney on the 27th of April 1896; but though he did not live to see the realization of his efforts, he may justly be called the Father of the Australian Commonwealth.

He published, in addition to the works already named and numerous volumes of verse, a collection of speeches on the Federal Government of Australia (1890), and an autobiography, Fifty Years in the Making of Australia (1892).

PARKIN, GEORGE ROBERT (1846—), British Canadian educationist, was born at Salisbury, New Brunswick, on the 8th of February 1846. His father had gone to Canada from Yorkshire. Parkin was the youngest of a family of thirteen, and after attending the local schools he started at an early age as a teacher. Bent on improving his own education, he then entered the university of New Brunswick, where he carried off high honours in 1866-1868. From 1868 to 1872 he was head master
of Bathurst grammar school; but he was not content with the opportunities for study open to him in Canada, and he went to England and entered Oxford. Here the enthusiastic young Canadian was not only profoundly affected himself by entering strenuously into the life of the ancient university (he was secretary of the Union when H. H. Asquith was president), but in his turn was instrumental in bringing the possibilities of British Imperialism to the minds of some of the ablest among his contemporaries—his juniors by six or eight years. It is hardly too much to say that in his intercourse at Oxford in the early 'seventies with men of influence who were then undergraduates of the imperialist movement in England substantially began. On returning to Canada he became principal of the chief New Brunswick school at Fredericton (where in 1878 he married), and for fifteen years he did excellent work in this capacity. But in 1889 he was again drawn more directly into the imperialist cause. The federation movement had gone ahead in the meanwhile, and Parkin had always been associated with it; and now he became a missionary speaker for the Imperial Federation League, travelling for several years about the empire for that purpose. He also became Canadian correspondent of The Times, and in that capacity helped to make Canada better known in the mother country. In 1894 he was given the honorary degree of LL.D. by Oxford. In 1895 he returned to scholastic work as principal of Upper Canada College, Toronto, and retained this post till 1902; but he continued in the meanwhile to support the imperialist movement by voice and pen. When in 1902 an organizer was required for the Rhodes Scholarship Trust (see Rudes, Cecil), in order to create the machinery for working it in the countries to which it was applied, he accepted the appointment; and his devotion to this task was largely responsible for the success with which Rhodes's idea was carried out at Oxford. His publications include Reorganisation of the British Empire (1882), Imperial Federation (1892), Round the Empire (1892), Life of Edward Tiring (1897), Life of Sir John Mathers (1901).

PARKINSON—JAMES (d. 1844). English palaeontologist, was educated for the medical profession, and practised in Hoxton, from about the year 1785. He was a Fellow of the Royal College of Surgeons, and one of the original members of the Geological Society of London (1807). He was author of numerous chemical and medical books, the most important of which were Organic Remains of a Former World (3 vols., 1804, 1808, 1811), and Outlines of Oryctology (1822). Parkinson died in London, on the 21st of December 1824. See Hist. of Collections in Brit. Mus. Nat. Hist. Dep. (1904), pp. 315-316.

PARKMAN, FRANCIS (1823-1893), American historian, was born in Boston on the 16th of September 1823. His great-grandfather, Ebenezer Parkman, a graduate of Harvard in 1721, was for nearly sixty years minister of the Congregational Church in Westborough, and was noted for his devotion to the study of history. One of his grandson's forebears, John Parkman, became a prominent merchant in Boston, and exhibited much skill in horticulture. Samuel's son, Francis Parkman, a graduate of Harvard in 1807, was one of the most eminent of the Boston clericals, a pupil and friend of Channing, and noted among Unitarians for a broadly tolerant disposition. This Dr Parkman, a man of rare sagacity and exquisite humour, was the father of Francis Parkman, the historian. His mother was a descendant of the celebrated John Cotton. She was the daughter of Nathaniel Hall of Medford, member of a family which was represented in the convention that framed the constitution of Massachusetts in 1780.

Francis Parkman was the eldest of her six children. As a boy his health was delicate, so that it was thought best for him to spend much of his time at his grandfather Hall's home in Medford rather than in the city. That home was situated on the border of the Middlesex Fells, a rough and rocky woodland, 4000 acres in extent, as wild and savage in many places as the prizemost forest. The place is within 8 m. of Boston, and it may be doubted if anywhere else can be found another such magnificent piece of wilderness so near to a great city. There young Parkman spent his leisure hours in collecting eggs, insects and reptiles, tracking marauders and woodcocks, and shooting birds with arrows. This breezy life saved him from the artificial stupidity which is too often superinduced in boys by their school training. At the age of fourteen Parkman began to show a strong taste for literary composition. In 1841, while a student at Harvard, he made a rough journey of exploration in the woods of northern New Hampshire, where he had a taste of adventure slightly spiced with hardship. About this time he made up his mind to write a history of the last French war in America, which ended in the conquest of Canada, and some time afterwards he enlarged the plan so as to include the whole course of the American conflict between France and Great Britain; or, to use his own words, 'The history of the American forest; for this was the light in which I regarded it. My theme fascinated me, and I was haunted with wilderness images day and night.' The way in which true genius works could not be more happily described. In the course of 1842 an attack of illness led to his making a journey in Italy, where he spent some time in a monastery belonging to one of the strictest of all the monastic orders, the Passionists, brethren addicted to wearing hair shirts and scourging themselves without mercy. In the young historian's eyes these good brethren were of much value as living and breathing historic material. In 1844 he graduated at Harvard with high rank.

He now made up his mind to study the real wilderness in its gloom and vastness, and to meet face to face the dusky warriors of the Stone Age. To-day such a thing can hardly be done within the United States, for nowhere does the primitive wilderness exist save here and there in shreds and patches. So recently as the middle of the 19th century, however, it covered the western half of the continent, and could be reached by a journey of 1600 or 1700 miles from Boston to the plains of Nebraska. Parkman had become an adept in woodcraft and a dead shot with the rifle, and could do such things with horses, tame or wild, as civilized people never see done excepting in the country. In co-operation with his friend and classmate, Mr Quincy Shaw, he passed several months with the Ogilzlah band of Sioux. Knowledge, intrepidity and tact carried Parkman through these experiences unscathed, and good luck kept him clear of encounters with hostile Indians, in which these qualities might not have sufficed to avert destruction. It was a very important experience in relation to his life-work. This outdoor life, however, did not suffice to recruit Parkman's health, and by 1848, when he began writing The Conspiracy of Pontiac, he had reached a truly pitiable condition. The trouble seems to have been some form of nervous exhaustion, accompanied with such hypersensitiveness of the eyes that it was impossible to keep them open except in a dark room. Against these difficulties he struggled with characteristic obstinacy. He invented a machine which so supported his head that he could write legibly with his eyes shut, while notes were made by him with eyes shut, and were afterwards deciphered and read aloud to him till he had mastered them. After half an hour his strength would give out, and in these circumstances his rate of composition for a long time averaged scarcely six lines a day. The superb historical monograph composed under such difficulties was published in 1851. It had but a small sale, as the American public was then too ignorant to feel much interest in American history.

Undeterred by this inhospitable reception, Parkman took up at the beginning his great work on France and England in the New World, to which the book just mentioned was in reality the sequel. This work obliged him to trace out, collect, arrange, and digest a great mass of incongruous material scattered on both sides of the Atlantic, a large portion of which was in manuscript, and required much tedious exploration and the employment of trained copyists. This work involved several journeys to Europe, and was performed with a thoroughness approaching finality. In 1865 the first volume of the great work appeared, under the title of Pioneers of France in the New World; and then
seven-and-twenty years more elapsed before the final volumes came out in 1892. Nowhere can we find a better illustration of the French critic’s definition of a great life—a thought conceived in youth, and realized in later years. After the Pioneers the sequence is The Jesuits in North America, La Salle and the Discovery of the Great West, The Old Régime in Canada, Frontenac and New France and Louis XIV., Montcalm and Wolfe, A Half Century of Conflict. As one obstacle after another was surmounted, as one grand division of the work after another became an accomplished fact, the effect upon Parkman’s condition seems to have been bracing, and he acquired fresh impetus as he approached the goal. There will be little doubt that his physical condition was much improved by his habit of cultivating plants. His garden was a study in the wealth of profound attainments, and himself originated several new varieties of flowers. His work in this department made him an enthusiastic adherent of the views of Darwin. He was professor of horticulture in the agricultural school of Harvard in 1871–1872, and published a few books on the subject of gardening. He died at Jamaica Plain, near Boston, on the 8th of November 1893.

The significance of Parkman’s work consists partly in the success with which he has depicted the North-American Indians, those belated children of the Stone Age, who have been so persistently misunderstood alike by romancers, such as Cooper, and by detractors like Dr Palfrey. Parkman was the first great literary historian to apply himself unreservedly to the study of Indian history and motives. Against this savage background of the forest Parkman shows the rise, progress and dramatic termination of the colossal struggle between France and Great Britain for colonial empire. With true philosophic insight he shows that France failed in the struggle not because of any inferiority in the ability and character of the men to whom the work was entrusted, but chiefly by reason of her despotic and protective régime. There is no more eloquent commentary upon the whole some results of British self-government than is to be found in Parkman’s book. But while the author deals with history philosophically, he does not, like Buckle, hurl at the reader’s head huge generalizations, or, like Carlyle, preach him into somnolence. With all its manifold instructiveness, his book is a narrative as entertaining as those of Macaulay or Froude.

In judicial impartiality Parkman may be compared with Gardiner, and for accuracy of learning with Stubbs.

There is a good Life by G. H. Farnham (Boston, 1900). (J. F.)

PARLA KIMEDI, a town of British India, in Ganjam district of Madras. Pop. (1901), 17,336. It is the residence of a raja, who claims descent from the ancient kings of Orissa. Its estate covers an area of 614 sq. m., and pays a revenue of £7,000 out of an estimated income of £26,000. He maintains a college, and has constructed a light railway (25 m.) to the station of Naupada on the East Coast railway. There is a trade in rice, mats and other articles are woven of reeds.

PARLEMENT (see PARLIAMENT). O. Fr. the name given to any meeting for discussion or debate (parler, to speak), a sense in which it was still used by Joinville, but from the latter half of the 13th century employed in France in a special sense to designate the sessions of the royal court (curia regis). Finally, when the Parlement of Paris had become a permanent court of justice, having the supreme authority in cases brought before it, and especially in appeals against the sentences of the baillis and seneschals, it retained this name, which was also given to the other supreme courts of the same nature which were created after its model in the provinces.

The early Capetians had a custom, based upon ancient precedents, of summoning periodically to their court their principal vassals and the prelates of their kingdom. These gatherings took place on the occasion of one of the great festivities of the year, in the town in which the king was then in residence. Here they deliberated upon political matters and the vassals and prelates gave the king their advice. But the monarch also gave judgment here in those cases which were brought before him. These were few in number during the early days of the Capetian dynasty; for though the king always maintained the principle that he was judge, and even that his competence in this respect was general and unlimited, this competence was at the same time undefined and it was not compulsory to submit cases to the king. At this period, too, appeal, strictly so called, did not exist. Nevertheless when a suit was brought before the king he judged it with the assistance of his prelates and vassals assembled around him, who formed his council. This was the curia regis. But in law the king was sole judge, the vassals and prelates being only advisers. During the 12th and at the beginning of the 13th centuries the curia regis continued to discharge these functions, except that its importance and actual competence continued to increase, and that we find a council in it, in addition to the vassals and prelates who formed the council, consuls, who are evidently men from the king had in his entourage, as his ordinary and professional councillors. Under the reign of St Louis (which was also the period at which the name parlement began to be applied to these judicial sessions) the aspect of affairs changed. The judicial competence of the Parlement developed and became more clearly defined; the system of appeals came into existence, and appeals against the judgments of the baillis and seneschals were brought before it; cases concerning the royal towns, the bonnes villes, were also decided by it. Again, in the old registers of the Parlement at this period, the first Olim books, we see the names of the same councillors recurring from session to session. This again suggests that a sufficient number of councillors was assured beforehand, and a list drawn up for each session; the vassals and prelates still figuring as a complementary body at the council.

Next came the series of ordinances regulating the tenure of the Parlement, those of 1278, 1291, 1296 and 1308, and the institution was regularized. Not only were the persons who were to constitute each Parlement named in advance, but those who were not placed on this list, even though vassals or prelates, were excluded from judging cases. The royal baillis had to attend the Parlement, in order to answer for their judgments, and at an early date was fixed the order of the different baillages, in which the cases coming from them were heard. The baillis, when not interested in the case, formed part of the council, but were afterwards excluded from it. Before the middle of the 14th century the social status of the Parlement, the counts and councillors, became fixed de facto if not de jure. Every year a list was drawn up of those who were to hold the session, and although this list was annual, it contains the same names year after year; they are as yet, however, only annual comissaires (commissaires). In 1344 they became officials (officiers) but not yet irremovable. At the same time the Parlement had become permanent; the number of the sessions had diminished, but their length had increased. In the course of the 14th century it became the rule for the Parlement to sit from Martinmas (Nov. 11) till the end of May; later the session was prolonged till the middle of August, the rest of the year forming the vacation. The Parlement had also become fixed at Paris, and, by a development of the practice of the earlier times, the presidents and councillors, instead of being merely the king’s advisers, had acquired certain powers, though these were conferred by the monarch; they were, in fact, true magistrates. The king held his court in person less and less often, and it pronounced its decrees in his absence; we even find him pleading his cause before it as plaintiff or defendant. In the 14th century, however, we still find the Parlement referring delicate affairs to the king; but in the 15th century it had acquired a jurisdiction independent in principle. As to its composition, it continued to preserve one notable feature which recalled its origin. It had originally been an assembly of lay vassals and prelates; when its composition became fixed and consisted of councillor magistrates, a certain number of these offices were necessarily occupied by laymen, and others by ecclesiastics, the conseillers lais and the conseillers clerks.

The Parlement was at the same time the court of peers (cour des pairs). This had as its origin the old principle according
to which every vassal had the right to be tried by his peers, i.e. by the vassals holding fiefs from the same lord, who sat in judgment with that lord as president. This, it is well known, resulted in the formation of the ancient college of the peers of France, which consisted of six laymen and six ecclesiastics. But although in strict logic the feudal causes concerning them should have been judged by them alone, they could not maintain this right in the curia regis; the other persons sitting in it could also take part in judging causes which concerned the peers. Finally the peers of France, the number of whom was increased in course of time by fresh royal creations of peersages, became ex officio members of the Parlement; they were the hereditary councillors, taking the oath as official magistrates, and, if they wished, sitting and having a deliberative function in the Parlement. In suits brought against them personally or involving the rights of their peerage they had the right of being judged by the Parlement, the other peers being present, or having been duly summoned.

While maintaining its unity, the Parlement had been subdivided into several chambers or sections. In the first place there was the Grand Chambre, which represented the primitive Parlement. To it was reserved the judgment in certain important cases, and in it a peculiar procedure was followed, known as oral, though it admitted certain written documents. Even after the offices of the Parlement had become legally saleable the councillors could only pass from the other chambers into the Grand Chambre by order of seniority. The Chambres des enquêtes and des requêtes originated at the time when it became customary to draw up lists for each session of the Parlement. The enquêteurs or auditeurs of the Parlement had at first been an auxiliary staff of clerks to whom were entrusted the inquests ordered by the Parlement. But later, when the institution of the appeal was fully developed, and the procedure before the various jurisdictions became a highly technical matter, above all when it admitted written evidence, the documents connected with other inquests also came before the Parlement. A new form of appeal grew up side by side with the older form, which had been mainly an oral procedure, namely the appeal by writing (appel par écrit). In order to judge these new appeals the Parlement had above all to study written documents, the inquests which had been made and written down under the jurisdiction of the court of first instance. The duty of the enquêteurs was to make an abstract of the written documents and report on them. Later the reporters (rapporteurs) were admitted to judge these questions together with a certain number of members of the Parlement, and from 1336 onwards these two kinds of member formed together a chambre des enquêtes. As yet, no doubt, the rapporteur only gave his opinion on the case which he had prepared, but after 1336 all those who formed part of the chamber were put on the same footing, taking it in turn to report and giving judgment as a whole. For a long time, however, the Grand Chambre received all cases, then sent them to the Chambre des enquêtes with directions; before it too were argued questions arising out of the inquiry made by the Chambre des enquêtes, to the decisions of which it gave effect, and not mere complaints. But one by one it lost all these rights, and in the 16th century they are no longer heard of. Several Chambres des enquêtes were created after the first one, and it was they who had the greater part of the work.

The Chambre des requêtes was of an entirely different nature. At the beginning of the 14th century a certain number of 11 one who were to hold the session of the Parlement were set apart to receive and judge the petitions (requêtes) on judicial questions which had been presented to the king and not yet dealt with. This eventually led to the formation of a chamber, in the strict sense of the word, the Requêtes du palais. But this became purely a jurisdiction for privileged persons; before it (or before the Requêtes de l'hôtel, as the case might be) were brought the civil suits of those who enjoyed the right of Committimus. The Chambre des requêtes had not supreme jurisdiction, but appeals from its decisions could be made to the Parlement proper.

The Parlement had also a criminal chamber, that of La Tourneuil which was not legally created until the 16th century, but was active long before then. It had no definite membership, but the conseillers lais served it in their turn.

Originally there was only one Parlement, that of Paris, that of Paris, as was indeed logical, considering that the Parlement was simply a continuation of the curia regis, which, like the king, could only be one. But the exigencies of the administration of justice led to the successive creation of a certain number of provincial parlements. Their creation, moreover, was generally dictated by political circumstances, after the incorporation of a province in the domain of the Crown. Sometimes it was a question of a province which, before its annexation, possessed a superior and sovereign jurisdiction of its own, and to which it was desired to preserve this advantage. Or else it might be a province forming part of feudal France, which before the annexation had had a superior jurisdiction from which the Crown had endeavored to institute an appeal to the Parlement of Paris, but for which after the annexation it was no longer necessary to maintain this appeal, so that the province might now be given a supreme court, a parlement. Sometimes an intermediate régime was set up between the annexation of the province and the creation of its provincial parlement, under which delegates from the Parlement of Paris went and held assizes there. Thus were created successively the parlements of Toulouse, Grenoble, Bordeaux, Dijon, Rouen, Aix, Rennes, Paumetz, Douai, Besançon and Nancy. From 1762 to 1771 there was even a parlement for the principality of Dombes. The provincial parlements reproduced in a smaller scale the organization of that of Paris; but they did not combine the functions of a court of peers. They each claimed to possess equal powers within their own province. There were also great judicial bodies exercising the same functions as the parlements, though without bearing the name, such as the Conseil souverain of Alsace at Colmar, the Conseil supérieur of Roussillon at Perpignan; the provincial council of Artois had not the supreme jurisdiction in all respects.

The parlements, besides their judicial functions, also possessed political rights; they claimed a share in the higher policy of the realm, and the position of guardians of its fundamental laws. In general the laws did not come into effect within their province until they had been registered by the parlements. This was the method of promulgation admitted by the ancient law of France, but the parlements verified the laws before registering them, i.e. they examined them to see whether they were in conformity with the principles of law and justice, and with the interests of the king and his subjects; if they considered that this was not the case they refused their registration and addressed remonstrances (remontrances) to the king. In acting thus they were merely conforming to the duty of counselling (devoir de conseil) which all the superior authorities had towards the king, and the text of the ordinances (ordonnances) had often invited them to do so. It was natural, however, that in the end the royal will should seek to impose itself. In order to ensure the registration of edicts the king would send lettres de cachet, known as lettres de cachet, was obeyed, however, always obeyed. Or he could come in person to hold the parlement, and have the law registered in his presence in a lit de justice. This was explained in theory by the principle that if the king himself held his court, it lost, by the fact of his presence, all the authority which he had delegated to it; for the moment the only authority existing in it was that of the king, just as in the ancient curia regis there was the principle that appartenne rege cessat magistratus. But, principally in the 18th century, the parlements maintained that only a voluntary registration, by the consent of the parlement, was valid.

The parlements had also a wide power of administration. They could make regulations (pouvoir réglementaire) having the force of law within their province, upon all points not settled by law, when the matter with which they dealt fell within their judicial competence, and for this it was only necessary that their interference in the matter was not forbidden by law. These were what were called arrêté de règlement.
By this means the parlements took part in the administration, except in matters of the cognizance which was attributed to another supreme court as that of taxation was to the cours des aides. They could also, within the same limits, address injunctions (injuctions) to officials and individuals.

Langlois, Textes relatifs à l’histoire du parlement depuis les origines jusqu’en 1716 (1888); Guillié, Recueils et écrits (1893); Glasson, Le livre de parlement, Paris, son rôle politique depuis le règne de Charles VII. jusqu’à la révolution (2 vols., 1901). (J. F. P.)

PARLIAMENT (Anglo-Lat. parliamentum, Fr. parlement, from parler, to speak), the name given to the supreme legislature of the United Kingdom of Great Britain and Ireland. (For the old French parlement, see PARLEMENT; and for analogous foreign assemblies see the articles on their respective countries.) The word is found in English from the 13th century, first for a debate, then for a formal conference, and for the great councils of the Plantagenet kings; and the modern sense has come to be applied retrospectively. William the Conqueror is said in the Chronicle to have had "deep speech with his Witam"; this "deep speech" (in Latin colloquium, in French parlement) was the distinguishing feature of a meeting between king and people, and thus gave its name to the national assembly itself. The Statut of Warkwicke (1275) first uses "parlement" of the great council in England.

The British Parliament consists of the King (or Queen regnant), the Lords spiritual and temporal, and the Commons; and it meets in two houses, the House of Lords (the Upper or Second chamber) and the House of Commons.

The Crown, pre-eminent in rank and dignity, is the legal source of parliamentary authority. The sovereign virtually appoints the lords spiritual, and all the peersages of the lords temporal have been created by the Crown. The King summons parliament to meet, and prescribes the time and place of its meeting, prorogues and dissolves it, and commands the issue of writs for the election of members of the House of Commons. The sitting of the House, beginning with the 4 Edward III. c. 14, the annual meeting of parliament had been ordained; but these statutes, continually disregarded, were virtually repealed in the reigns of Charles II. and William and Mary (16 Ch. II. 31; 6 & 7 Will. & Mary, 32). The present statute law merely exacts the meeting of parliament once in three years; but the annual voting of supplies has long since superseded obsolete statutes. When parliament is assembled it cannot proceed to business until the king has declared the causes of summons, in person or by commission; and though the veto of the Crown on legislation has long been obsolete, bills passed by the two houses only become law on receiving the royal assent.

The House of Lords is distinguished by peculiar dignities, privileges, and jurisdiction. Peers individually enjoy the rank and precedence of their several dignities, and are hereditary councillors of the Crown. Collectively with the lords spiritual they form a permanent council of the Crown; and, when assembled in parliament, they form the highest court of judicature in the realm, and are (in constitutional theory at all events) a co-equal branch of the legislature, without whose consent no laws can be made (see below, House of Lords Question). Their jurisdiction is of various kinds, viz. for the trial of peers; for determining claims of peerage and offices of honour, under references from the Crown; for the trial of controverted elections of Scotch and Irish peers; for the final determination of appeals from courts in England, Scotland and Ireland; and, lastly, for the trial of peeresses.

The House of Commons also has its own peculiar privileges and jurisdictions. Above all, it has the paramount right of originating the imposition of all taxes, and the granting of supplies for the service of the state. It has also enjoyed, from early times, the right of determining all matters concerning the election of its own members, and their right to sit and vote in parliament. This right, however, has been greatly abridged, as, in 1868, the trial of controverted elections was transferred to the courts of law; but its jurisdiction in matters of election is not otherwise provided for by statute, is still retained intact. As part of this jurisdiction the house directs the Speaker to issue warrants to the clerk of the Crown to make out new writs for the election of members to fill up such vacancies as occur during the sitting of parliament.

Privileges of Parliament.—Both houses are in the enjoyment of certain privileges, designed to maintain their authority, independence and dignity; and, when necessary, to protect the law and custom of parliament, while some have been confirmed, and others abridged or abrogated by statute. The Lords rely on their inherent right, as having a place and voice in parliament ; but, as the Commons disallow the, the Commons lay claim, by humble petition to the Crown at the commencement of every parliament, "to their ancient and undoubted rights and privileges. Each house has its separate rights and jurisdictions; but, the privileges property so-called, being founded upon the law and custom of parliament, are common to both houses. Each house adjudges whether any breach of privilege has been committed, and punishes offenders by censure or commitment. This right of impeaching ministers was formerly established, and it extends to the protection of officers of the house, lawfully and properly executing its orders, who are also empowered to arrest the assailants of the public authority. The causes of such commitments cannot be inquired into before the house, and can prisoners be admitted to bail. Breaches of privilege may be summarized as disobedience to any orders or rules of the house, or refusal to perform their duties; or contempt of the house, as offered to the house or to its members, or to the House or its officers, or to its records; or the doing of any act of violence, or of insulting, or of libels upon members, or interference with or tampering with the papers of members in the house, in discharge of their duty, or tampering with witnesses. Such offences are dealt with as contempt, according to the circumstances; but, in the respective cases, of which numerous precedents are to be found in the journals of both houses. The Lords may impose a fine on a member for a fixed period, and impose fines; the Commons can only imprison generally, the commitment being concluded by the prorogation, and fixed long denounced as a wrong.

Freedom of speech has been one of the most cherished privileges of parliament from early times. Constantly asserted, and often violated, it was finally declared by the Bill of Rights "that the freedom of speech and debates and proceedings in parliament, ought not to be impeached or questioned in any court or place out of parliament." Such a privilege is essential to the independence of parliament, and to the protection of members in discharge of their duties. But, while it protects members from molestation elsewhere, it leaves them open to censure or other punishment by the house itself, whenever they abuse their privilege and transgress the rules of orderly debate.

Protection from arrest is a privilege of the highest antiquity. It was formerly of extensive scope; but has been reduced, by later legislation, within very narrow limits. Formerly not only the persons of members but their goods were protected, and their property extended to their wives and children, who were themselves free from arrest, but otherwise they are liable to all the processes of the courts. If arrested, they will be immediately discharged, upon motion in the court whence the process issued. Peers and peersesses are, by the privilege of pre-emption, from arrest at all times. Members of the House of Commons are free only for forty days after prorogation and forty days before the next appointed meeting; but prorogations are so arranged as to ensure a continuing privilege. Formerly, even suits against members were stayed, but this offensive privilege has been abolished by statute. Exemption from attending as witnesses upon subpoena, once an acknowledged privilege, is no longer insisted upon; but the privilege of having a legal service in the person of a lawyer or advocate, is still insisted upon. The privilege of freedom from arrest is limited to civil causes, and has not been suffered to exempt members from the operation of the criminal law, nor even from commitments to the criminal courts; but, where the right of a member is so interfered with, the courts are required immediately to inform the house of the causes of his commitment. Witnesses, suitors, counsel and agents in attendance upon parliament are also protected from arrest without commitment, and from the consequences of statements made by them, or other proceedings in the course of their cases.

In such cases, in enforcing their privileges, are obliged to commit offenders, or otherwise interfere with the liberty of the subject, the exercise of these privileges has naturally been called in question before the courts. Each house is the sole judge of its own privileges; but the courts are bound to administer the law, and, where law provides, have such and such a variable of jurisdiction has arisen between parliament and the courts. Many interesting controversies have arisen upon such occasions; but of late years privilege has been carefully restrained within the circle of limited and the courts have amply recognized the authority of parliament.
Parliamentary Procedure.—It will be convenient here to sketch the general lines of procedure. On the day appointed for the meeting of a new parliament both houses assemble in their respective chambers, when the Lords Commissioners for opening the parliament summon the Commons to the bar of the House of Lords, by the mouth of Black Rod, to hear the commission read. The lord chancellor states that, when the members of both houses shall be sworn, the king will declare the causes of his calling this parliament; and, it being necessary that a Speaker of the House of Commons shall be first chosen, the Commons are directed to proceed to the appointment of a Speaker, and to present him, on the following day, for His Majesty's royal approbation. The Commons at once withdraw to their own house and proceed to the election of their Speaker. The next day the Speaker-elect proceeds, with the house, to the House of Lords, and, on receiving the royal approbation, lays claim, in the accustomed form, on behalf of the Commons, "to their ancient and undisputed rights and privileges." The Speaker, now fully confirmed, returns to the House of Commons, and, after repeating his acknowledgments, reminds them that the first thing to be done is to take and subscribe the oath required of each member, and proceeds first to call on the tellers followed by other members, who come to the table to be sworn. The swearing of members in both houses proceeds from day to day, until the greater number have taken the oath, or affirmation, when the causes of summons are declared by His Majesty in person, or by commission, in "the King's speech." This speech being considered in both houses, an Address (g.v.) in answer is agreed to, which is presented to His Majesty by the whole house, or by "the lords with white wands" in one house andprivy councillors in the other.

The debate on the Address being over, the real business of the session now commences: the committees of supply and ways and means are set up; bills are introduced; motions are made; committees are appointed; and both houses are, at once, in full activity. The Lord Chancellor presides over the deliberations of the Lords, and the Speaker over those of the Commons. A quorum of the House of Lords, including the chancellor, is three (thirty for divisions); that of the House of Commons, including the Speaker, is forty.

Every matter is determined, in both houses, upon questions put from the chair, and resolved in the affirmative or negative, or otherwise disposed of by the withdrawal of the motion, by amendments, by the adjournment of the house, by the reading of the orders of the day, or by the previous question. Notices are required to be given of original motions; and the different stages of bills, and other matters appointed for consideration by the house, stand as orders of the day. Questions of privilege are allowed precedence of all the business on any day; but this rule, being liable to grave abuses, is guarded by strict limitations. Debates arise when a question has been proposed from the chair; and at the close of the debate (for the "closure" in the House of Commons, see below, House of Commons, Internal Reforms) the question is put, with or without amendment, as the case may be, and is determined, when necessary, by a division. No question or bill, substantially the same as one upon which the judgment of the house has already been given, may be again proposed during the same session.

Parliamentary Procedure.—In the House of Commons, on all important motions, the Speaker is not only master of the house, but the guardian of the public interest. He presides at the bar, and he has entire powers of deciding all questions of order. When he is satisfied that the house is ready to deliberate upon a question, he calls upon the member who is to move or second a motion, to enter into debate by rising in their places.

When more than one member rises at the same time, in the Lords the member who is to speak is called by the house, in the Commons by the Speaker. Every member, when called, is bound to speak to the question before the house; and calls to order are very frequent. A member may speak once only to any question, except to explain, or upon a point of order, or to reply when a member has himself submitted a motion to the house, or when an amendment has been moved which constitutes a new question. He may not refer to past debates, nor to debates in the other house; nor may he refer to any other member by name, or use offensive and disorderly language against the king, either House of Parliament, or other members. Members offending against any of the rules of debate are called to order by the Speaker, or the attention of the chair is directed to the breach of order by another member. Order is generally enforced by the formal citation of a member, or in the case of serious misconduct, especially when obstruction is being practised, the offending member is named by the Speaker, and suspended by an order of the house, or otherwise punished at the discretion of the house.

At the conclusion of a debate, unless the motion be withdrawn, or the question (on being put from the chair) be agreed to or negatived, the house proceeds to a division, which effects the twofold purpose of ascertaining the numbers supporting and opposing the question, and of recording the names of members voting on either side. On each side of the house is a division lobby; and in the Lords the "contents" and in the Commons the "ayes" are directed to go to the right, and the "no contents" or "noes" to the left. The former pass into the right lobby, at the back of the Speaker's chair, and return to the house through the bar; the latter pass into the left lobby, at the bar, and return at the back of the chair. The opposing parties are thus kept entirely clear of one another. In each lobby there are two members acting as tellers, who count the members as they pass, and two division clerks who take down their names. After the counting is over, the details of the division are announced, and are reported by one of the tellers for the majority. In case of an equality of numbers, it is the Lords the question is negatived in virtue of the ancient rule "semper praesumitur pro negante," in the Commons the Speaker gives the casting vote.

Committees of the Whole House.—For the sake of convenience in the transaction of business there are several kinds of committees. Of these the most important is a committee of the whole house, consisting of the entire body of the house. The Speaker may appoint a committee. It is presided over by a chairman, who sits in the clerk's chair at the table, the mace, which represents the authority of the house itself, being for the time placed under him. In this committee are discussed several provisions of bills, resolutions and other matters requiring the consideration of details. To facilitate discussion, members are allowed to speak any number of times to the same question; otherwise the proceedings are similar to those of the house itself. In the Lords, the chair is taken by the chairman of committees; and in the Commons the chair of the committee of ways and means, or in his absence by any other member. The quorum of such a committee is the same as that of the house itself. It reports from time to time to the house, but has no power of adjournment.

Grand and Standing Committees.—In the House of Commons there were formerly four grand committees, viz. for religion, for grievances, for courts of justice, and for trade. They were founded (like all the other parliamentary bodies of the time) on the model of several bodies of men; but, having fallen into disuse, they were discontinued in 1832. The ancient committee of privileges, in which "all who come are to have voices," is still appointed at the common sessions, but only at the request of that house, and is generally examined or an action, as it has been found more convenient to appoint a select committee to inquire into any question of privilege as it arises. In 1882 a partial revival of grand committees was effected by the appointment of two standing committees for the consideration of bills relating to law and courts of justice and to trade; and grand committees have since been considerably extended.

Select Committees.—In select committees both houses find the means of regarding inquiries, and the consideration of other matters, which could not be undertaken by the whole house. The reports of such committees have formed the groundwork of many important measures; and bills are often referred to them which receive a fuller examination than could be expected in a committee of the whole house. It is to a select committee that the House of Commons has often referred the examination of witnesses, on papers, persons and records. In the Lords the power of examining witnesses upon oath has always been exercised, but it was not until 1871 that the same power was extended to the Commons, by statute.

Communications between the Two Houses.—In the course of the proceedings of parliament, frequent communications between the two houses become necessary. Of these the most usual and constant is that of communications between the houses by message by two judges or two masters in chancery, and the Commons by a deputation of their own members; but since 1855 messages have been taken from one house to the other by one of the maces, which is placed on the table of the house to which it is directed; the mace is received at the bar, by a conference, in reference to amendments to bills or other matters; but this proceeding has in great measure superseded by the more simple form of a message. The two houses are also of their own accord, or on the requisition of joint committees and of select committees communicating with each other.

Communications between the Crown and Parliament.—Communications, in various forms, are also conducted between the Crown
and both Houses of Parliament. Of these the most important are those in which the king, in person or by commission, is present in the House of Lords to open or prorogue parliament, or to give the royal assent to bills. His Majesty is then in direct communication with the three estates of the realm, and, without intermission, sends commands to both houses under the royal sign manual, when all the members are uncovered. Verbal messages are also sent, and the king’s pleasure, or royal recommendation or consent to bills or other matters, signified through a minister of state. All such messages under the royal sign manual are acknowledged by addresses, except where grants of money are proposed, in which case no address is presented by the Commons, who acknowledge them by making provision accordingly.

Both houses are addressed by joint addresses, but usually by separate addresses from each house. Such addresses are presented to His Majesty, either by the whole house, or by the lords with white staves in one house and by privy councillors in the other, on the subject of finance. A preliminary committee is appointed by the house; but, when presented otherwise, an answer is brought by one of the lords with white staves, or by one of the privy councillors, by whom the address has been presented. Representatives of either house are also sometimes directed to lay before His Majesty; and messages of congratulation or concurrence are sent to other members of the royal family.

The Passing of Public Bills.—The passing of bills forms the most considerable part of the business of parliament; but a brief notice of the manner of their procedure is necessary. It is substantially the same in both houses; but the privileges of the Commons, in regard to supply and taxation, require that all bills imposing a charge upon the people should originate in that house. Ordinarily, both the House of Commons and the Privy Council are addressed by joint addresses, but, if either house is of opinion that honours or in blood, or relating to their own privileges and jurisdiction, should commence in their house. An act of grace, or general pardon, originates with the Crown, and is read once only in each house. It is then referred to public and private bills; but, however, it still retains and exercises its jurisdiction in all cases not relegated by statute.

Impeachments and Trial of Peers.—Other forms of parliamentary procedure are rarely introduced into the debates of the Commons. The lords exercise the highest judicial jurisdiction known to the law; but the occasions upon which it has been brought into action have been very rare in modern times. Another judicature is that of the trial of peers by the House of Lords. And, since the period of the French Revolution, when the right of upper house was annulled by the English, the House of Lords has been restored to its ancient form and duties.

The Anglo-Saxon Polity.—The origin of parliament is to be traced to Anglo-Saxon times. The Angles, Saxons, and other Teutonic races who conquered Britain brought to their new homes their own laws and customs, their settled framework of society, their kinship, their village communities, and a certain rude representation in local affairs. And we find in the Anglo-Saxon polity, as developed during their rule in England, all the constituent parts of parliament. In their own lands they had chiefs and leaders, but no kings. But conquest and territorial settlement were followed by the assumption of royal dignities; and the victorious chiefs were accepted by their followers as kings. They were the head of private and public, of aristocracy.

A direct descent from their god Woden, and hereditary right, at once clothed them with a halo of glory and with supreme power; and, when the pagan deity was deposed, the king received consecration from a Christian archbishop, and was invested with sacred attributes as “the Lord’s anointed.” But the Saxon monarch was a patriarchal king of limited authority, who acted in concert with his people; and, though his succession was hereditary, in his own family, his direct descendant was liable to be passed over in favour of a worthier heir. Such a ruler was a fitting precursor of a line of constitutional kings, who in later times were to govern with the advice and consent of a free parliament.

Meanwhile any council approaching the constitution of a House of Lords was of slow growth. Anglo-Saxon society indeed, was not without an aristocracy. The highest in rank

and both Houses of Parliament. Of these the most important are those in which the king, in person or by commission, is present in the House of Lords to open or prorogue parliament, or to give the royal assent to bills. His Majesty is then in direct communication with the three estates of the realm, and, without intermission, sends commands to both houses under the royal sign manual, when all the members are uncovered. Verbal messages are also sent, and the king’s pleasure, or royal recommendation or consent to bills or other matters, signified through a minister of state. All such messages under the royal sign manual are acknowledged by addresses, except where grants of money are proposed, in which case no address is presented by the Commons, who acknowledge them by making provision accordingly.

Both houses are addressed by joint addresses, but usually by separate addresses from each house. Such addresses are presented to His Majesty, either by the whole house, or by the lords with white staves in one house and by privy councillors in the other, on the subject of finance. A preliminary committee is appointed by the house; but, when presented otherwise, an answer is brought by one of the lords with white staves, or by one of the privy councillors, by whom the address has been presented. Representatives of either house are also sometimes directed to lay before His Majesty; and messages of congratulation or concurrence are sent to other members of the royal family.

The Passing of Public Bills.—The passing of bills forms the most considerable part of the business of parliament; but a brief notice of the manner of their procedure is necessary. It is substantially the same in both houses; but the privileges of the Commons, in regard to supply and taxation, require that all bills imposing a charge upon the people should originate in that house. Ordinarily, both the House of Commons and the Privy Council are addressed by joint addresses, but, if either house is of opinion that honours or in blood, or relating to their own privileges and jurisdiction, should commence in their house. An act of grace, or general pardon, originates with the Crown, and is read once only in each house. It is then referred to public and private bills; but, however, it still retains and exercises its jurisdiction in all cases not relegated by statute.

Impeachments and Trial of Peers.—Other forms of parliamentary procedure are rarely introduced into the debates of the Commons. The lords exercise the highest judicial jurisdiction known to the law; but the occasions upon which it has been brought into action have been very rare in modern times. Another judicature is that of the trial of peers by the House of Lords. And, since the period of the French Revolution, when the right of upper house was annulled by the English, the House of Lords has been restored to its ancient form and duties.

The Anglo-Saxon Polity.—The origin of parliament is to be traced to Anglo-Saxon times. The Angles, Saxons, and other Teutonic races who conquered Britain brought to their new homes their own laws and customs, their settled framework of society, their kinship, their village communities, and a certain rude representation in local affairs. And we find in the Anglo-Saxon polity, as developed during their rule in England, all the constituent parts of parliament. In their own lands they had chiefs and leaders, but no kings. But conquest and territorial settlement were followed by the assumption of royal dignities; and the victorious chiefs were accepted by their followers as kings. They were the head of private and public, of aristocracy.

A direct descent from their god Woden, and hereditary right, at once clothed them with a halo of glory and with supreme power; and, when the pagan deity was deposed, the king received consecration from a Christian archbishop, and was invested with sacred attributes as “the Lord’s anointed.” But the Saxon monarch was a patriarchal king of limited authority, who acted in concert with his people; and, though his succession was hereditary, in his own family, his direct descendant was liable to be passed over in favour of a worthier heir. Such a ruler was a fitting precursor of a line of constitutional kings, who in later times were to govern with the advice and consent of a free parliament.

Meanwhile any council approaching the constitution of a House of Lords was of slow growth. Anglo-Saxon society indeed, was not without an aristocracy. The highest in rank
were æthelings—generally, if not exclusively, sons and brothers of the king. The ealdorman, originally a high officer, having the executive government of a shire, and a seat in the king's witan, became hereditary in certain families, and eventually attained the dignity of an earl. But centuries were to pass before the English nobility was to assume its modern character and denominations. At the head of each village was an earl, the chief of the freemen, or ceorls—their leader in war and patron in peace. The king's gesiths and thegns formed another privileged class. Admitted to offices in the king's household and councils, and enriched by grants of land, they gradually formed a feudal nobility.

The revival of the Christian Church, under the Anglo-Saxon rule, created another order of rulers and councillors, destined to take a leading part in the government of the state. The archbishops and bishops, having spiritual authority in their own dioceses, and exercising much local influence in temporal affairs, were also members of the national council, or witenagemót, and by their greater learning and capacity were not long in acquiring a leading part in the councils of the realm. Ecclesiastical councils were also held, comprising bishops, abbots, and clergy, in which we observe the origin of convocation. The abbots, thus associated with the bishops, also found a place with them in the witenagemót. By these several orders, summoned to advise the king in affairs of state, was formed a council of magnates— to be developed, in course of time, into an upper chamber, or House of Lords.

The rise of the Commons (see REPRESENTATION) as a political power in the national councils, was of yet slower development: but in the Anglo-Saxon moots may be discerned the first germs of popular government in England. In the town-moot the assembled freemen and cultivators of the "folk-lands" regulated the civil affairs of their own township, tithing, village or parish. In the burgh-moot the inhabitants administered their municipal business, under the presidency of a reeve. The hundred-moot assumed a more representative character, comprising the reeve and a selected number of freemen from the several townships and burhghs within the hundred. The shire-moot, or shire-gemot, was an assembly yet more important. An ealdorman was its president, and exercised a jurisdiction over a shire, or district comprising several hundreds. Attended by a reeve and four freemen from every hundred, it assumed a distinctly representative character. Its members, if not elected (in the modern sense) by the popular voice, were, in some fashion, deputed to act on behalf of those whose interests they had come to guard. The shire-moot was also the general folk-moot of the tribe, assembled in arms, to whom their leaders referred the decision of questions of peace and war.

Superior to these local institutions was the witenagemót, or assembly of wise men, with whom the king took counsel in legislation and the government of the state. This national council was the true beginning of the parliament of England. Such a council was originally held in each of the kingdoms commonly known as the Heptarchy; and after their union in a single realm under King Edgar, the witenagemót became the deliberative and legislative, or parliament, of that extended estate. The witenagemót made laws, imposed taxes, concluded treaties, advised the king as to the disposal of public lands and the appointment and removal of officers of state, and even assumed to elect and depose the king himself. The king had now attained to greater power, and more royal dignities and prerogatives. He was unquestionably the chief power in the witenagemót; but the laws were already promulgated, as in later times, as having been agreed to with the advice and consent of the witan. The witan also exercised jurisdiction as a supreme court. These ancient customs present further examples of the continuity of English constitutional forms.

The constitution of the witenagemót, however, was necessarily less popular than that of the local moots in the hundred or the shire. The king himself was generally present; and at his summonses came prelates, abbots, ealdormen, the king's gesiths and thegns, officers of state and of the royal household, and leading tenants in chief of lands held from the crown. Crowds sometimes attended the meetings of the witan, and shouted their endorsements of approval or dissent; and, so far, the popular voice was associated with its deliberations; but it was at a distance from all but the inhabitants of the place in which it was assembled, and until a system of representation (q.v.) had slowly grown up there could be no further admission of the people to its deliberations. In the town-moot the whole body of freemen and cultivators of the folk-lands met freely under a spreading oak, or on the village green; in the hundred-moot, or shire-gemót, deputies from neighbouring communities could readily find a place; but all was changed in the wider council of a kingdom. When there were many kingdoms, distance obstructed any general gathering of the Commons; and in the wider area of England such a gathering became impossible. Centuries were yet to pass before this obstacle was to be overcome by representation; but, in the meantime, the local institutions of the Anglo-Saxons were not without their influence upon the central council. The self-government of a free people informed the bishops, ealdormen, ceorls and thegns who dwelt among them of their interests and needs, their sufferings and their wrongs; and, while the popular voice was not heard, in the larger social society, they grew more powerful in the councils of their rulers.

Another circumstance must not be overlooked in estimating the political influence of the people in Anglo-Saxon times. For five centuries the country was convulsed with incessant wars—wars with the Britons, whom the invaders were driving from their homes, wars between the several kingdoms, wars with the Welsh, wars with the Picts, wars with the Danes. How could the people continue to assert their civil rights amid the clash of arms and a frequent change of masters? The warrior-kings and their armed followers were rulers in the land which they had conquered. At the same time the unsettled condition of the country repressed the social advancement of its people. Agriculture could not prosper when the farm of the husbandman too often became a battlefield. Trade could not be extended without security to property and industry. Under such conditions the great body of the people continued as peasants, handcrafts men and slaves. The time had not yet come when they could make their voice heard in the councils of the state.

The Norman Conquest.—The Anglo-Saxon polity was suddenly overthrown by the Norman Conquest. A stern foreign king had seized the crown, and was prepared to rule his conquered realm by the sword. He brought with him the absolutist principles of continental rulers, and the advanced feudal system of France and Normandy. Feudalism had been slowly gaining ground under the Saxon kings, and now it was firmly established as a military organization. William the Conqueror at once rewarded his warlike barons and followers with enormous grants of land. The Saxon landowners and peasants were despoiled, and the invaders settled in their homesteads. The king claimed the broad lands of England as his own, by right of conquest; and when he allowed his warriors to share the spoil he attached the strict condition of military service in return for every grant of land. An effective army of occupation of all ranks was thus created. The commoners who were granted land throughout the realm. England was held by the sword; a foreign king, forever, and foreign soldiers were in possession of the soil, and swore fealty to their master, from whom they held it. Saxon bishops were deposed, and foreign prelates appointed to rule over the English Church. Instead of calling a national witenagemót, the king took counsel with the officers of his state and household, the bishops, abbots, earls, barons and knights by whom he was pleased to surround himself. Some of the forms of a national council were indeed maintained, and its counsel and consent were proclaimed in the making of laws; but, in truth, the king was absolute.

Such a revolution seemed fatal to the liberties and ancient customs of Saxon England. What power could withstand the harsh conqueror? But the indestructible elements of English society prevailed over the sword. The king grasped, in his own hands, the higher administration and judicature of the realm;
but he continued the old local courts of the hundred and the shire, which had been the basis of Saxon freedom. The Norman twofold policy was otherwise destined to favour the liberties of the people, through agencies which had been designed to crush them. The powerful nobles, whom William and his successors exalted, became formidable rivals of the Crown itself; while ambitious barons were in their turn held in check by a jealousy and exacting church. The ruling powers, if combined, would have reduced the people to slavery; but their divisions proved a continual source of weakness. In the meantime the strong rule of the Normans, bitter as it was to Englishmen, repressed intestine wars and the disorders of a divided realm. Civil justice was fairly administered. When the spoils of the conquerors had been secured, the rights of property were protected, industry and trade were left free, and the occupation of the soil by foreigners drove numbers of landowners and freemen into the towns, where they prospered as merchants, traders and artificers, and collected thriving populations of townsmen. Meanwhile, foreign rulers having brought England into closer relations with the Continent, its commerce was extended to distant lands, ports and shipping were encouraged, and English traders were at once enriched and enlightened. Hence new classes of society were growing, who were eventually to become the Commons of England.

The Crown, the Barons, the Church and the People.—While these social changes were steadily advancing, the barons were already preparing the way for the assertion of popular rights. Ambitious, turbulent and grasping, they were constantly at issue with the Crown. Enjoying vast estates and great commands, and sharing with the prelates the government of the state, as members of the king's council, they were ever ready to raise the standard of revolt. The king could always count upon barons faithful to his cause, but he also appealed for aid to the Church and the people. The baronage was thus broken by insurrections, and divided by civil wars, while the value of popular alliances was revealed. The power of the people was ever increasing, while their oppressors were being struck down. The population of the country was still Saxon; they had been subdued, but had not been driven forth from the land, like the Britons in former invasions. The English language was still the common speech of the people; and Norman blood was being mingled with the broader stream of Saxon life. A continuous nationality was thus preserved, and was outgrowing the foreign element.

The Crown was weakened by disputed successions and foreign wars, and the baronage by the blood-stained fields of civil warfare; while both in turn looked to the people in their troubles. Meanwhile the Church was struggling, alike against the Crown and the barons, in defence of its ecclesiastical privileges and temporal possessions. Its clergy were brought by their spiritual ministrations into close relations with the people, and their culture contributed to the intellectual growth of English society. When William Rufus was threatened by his armed barons he took counsel with Archbishop Anselm and the barons, and justice was done. His promises were broken; but, like later charters, as lightly set aside, they were a recognition of the political rights of the people. By the charter of Henry I, restoring to the people the law of Edward the Confessor, the continuity of English institutions was acknowledged; and this concession was also proclaimed through Archbishop Anselm, the church and the people being again associated with the Crown against the barons. And throughout his reign the clergy and the English people were cordially united in support of the Crown. In the anarchic reign of Stephen—also distinguished by its futile charters—the clergy were driven into opposition to the king, while his oppressors alienated the people. Henry II. commenced his reign with another charter, which may be taken as a profession of good intentions on the part of the new king. So strong-willed a king, who could cripple his too powerful nobles, and forge shackles for the Church, was not predisposed to extend the liberties of his people; but they supported him loyally in his critical struggles; and his vigorous reforms in the administrative, judicial and financial organization of his realm promoted the prosperity and political influence of the Commons. At the same time the barons created in this and the two previous reigns, being no longer exclusively Norman in blood and connexion, associated themselves more readily with the interests and sympathies of the people. Under Richard I. the principle of representation was somewhat advanced, but it was confined to the assessment and collection of taxes in the different shires.

Magnae Carta (q.v.)—It was under King John that the greatest progress was made in national liberties. The loss of Normandy served to draw the baronage closer to the English people; and the king soon united all the forces of the realm against him. He outraged the Church, the barons and the people. He could no longer play one class against another; and they combined to extort the Great Charter of their liberties at Runnymede (1215). It was there ordained that no scutage or aid, except the three regular feudal aids, should be imposed, save by the common council of the realm. To this council the archbishops, bishops, abbots, earls and greater barons were to be summoned personally by the king's letters, and tenants in chief by a general writ through the sheriff. The summons was required to appoint a certain place, to give 40 days' notice at least, and to state the cause of meeting. At length we seem to reach some approach to modern usage.

Growth of the Commons.—The improved administration of successive kings had tended to enlarge the powers of the Crown. But one hundred and fifty years had now passed since the Conquest, and great advances had been made in the condition of the people, and more particularly in the population, wealth and self-government of towns. Many had obtained royal charters, elected their own magistrates, and enjoyed various commercial privileges. They were already a power in the state, which was soon to be more distinctly recognized.

The charter of King John was again promulgated under Henry III., for the sake of a subsidy; and henceforth the Commons learned to insist upon the redress of grievances in return for a grant of money. This reign was memorable in the history of parliament. Again the king was in conflict with his barons, who rebelled against his gross misgovernment of the realm. Simon de Montfort, earl of Leicester, was a patriot in advance of his age and fought for the English people as well as for his own order. The barons, indeed, were doubtful allies of the popular cause, and leaned to the king rather than to Simon. But the towns, the clergy, the universities and large bodies of the community rallied round him, and he overthrew the king and his followers at Lewes. He was now master of the realm, and proclaimed a new constitution. Kings had made promises, and granted illusory charters; but the rebel earl called an English parliament (1265) into being. Churchmen were on his side, and a few barons; but his main reliance was upon the Commons. He summoned to a national council, or parliament, bishops, abbots, earls and barons, together with two knights from every shire. But although the barons had indeed been summoned to former councils; but now he still now had delegates from the towns been invited to sit with bishops, barons and knights of the shire.

In the reign of Edward I. parliament assumed substantially its present form of king, lords and commons. The irregular and unauthorized scheme of Simon de Montfort was fully adopted; and in 1295 the king summoned to a parliament two knights from 1

1 In 1254 we have a distinct case of two knights summoned from each shire by royal writ. A war was going on in Gascony, and the king wanted money. He called the barons and asked if they would provide the necessary funds. The barons said that until the minor gentry were exceedingly unwilling to contribute, and the king sent to ask that two knights from each shire might be sent up to consult with him. In the result, the Commons refused to grant a subsidy, and the king had to fall back on the Church; but though the summoning of the knights of the shire was in form a small change from the previous practice of sending some one down to the counties to put pressure on them, the innovation is important as the first occasion on which their representatives met in a central assembly.—[H. Ch.]
every shire chosen by the freemen at the shire court, and two burgesses from every city, borough and leading town.1 The rebel earl had enlarged the basis of the national council; and, to secure popular support, the politic king accepted it as a convenient instrument of taxation. The knights and freemen had increased in numbers and wealth; and the towns, continually advancing in population, trade and commerce, had become valuable contributors to the revenue of the state. The grant of subsidies to the Crown, by the assembled baronage and representatives of the shires and towns, was a legal and comprehensive impost upon the entire realm.

Scession of the Clergy.—It formed part of Edward's policy to embrace the clergy in his scheme for the representation of all orders and classes of his subjects. They were summoned to attend the parliament of 1295 and succeeding parliaments of his reign, and some of their summons has been continued until the present time; but the clergy resolutely held aloof from the national council, and insisted upon voting their subsidies in their own conventions of Canterbury and York. The bishops retained their high place among the earls and barons, but the clergy sacrificed to ecclesiastical jealousies the privilege of sharing in the political councils of the state. As yet, indeed, this privilege seemed little more than the voting of subsidies, but it was soon to embrace the redress of grievances and the framing of laws for the general welfare of the realm; a great power they forfeited; as soon as they saw how it might have been a check to the interests of the Church, and in the legislation of their country? They could not have withstood the Reformation; they would have been forced to yield to the power of the Crown and the heated resolution of the laity; but they might have saved a large share of the endowments of the Church, and perhaps have modified the doctrines and formularies of the reformed establishment.

Reluctance of the Commons to Attend.—Meanwhile the Commons, unconscious of their future power, took their humble place in the great council of the realm. The knights of the shire, as lesser barons, or landowners of good social standing, could sit beside the magnates of the land without constraint; but modest traders from the towns were overawed by the power and dignity of their new associates. They knew that they were summoned for no other purpose than the taxing of themselves and their fellow townspeople; their attendance was irksome; it interrupted their own business; and their journeys exposed them to many hardships and dangers. It is not surprising that they should have shrunk from the exercise of so doubtful a privilege. Considerable numbers abstained themselves from a thankless service; and their constituents, far from expecting the assent of the Commons to the demands of the king, and of the Church, condemned the sorry stipend of 2s. a day, paid to their representatives while on duty, and strove to evade the burden imposed upon them by the Crown. Some even purchased charters, withdrawing franchises which they had not yet learned to value. Nor, in truth, did the representation of the towns at this period afford much protection to the rights and interests of the people. Towns were disfranchised at the will or caprice of the Crown and the sheriffs; they could be excluded at pleasure; and the least show of independence would be followed by the omission of another writ of summons. But the principle of representation (g.r.), once established, was to be developed with the expansion of society; and the despised burgesses of Edward I., not having ascended, like the clergy, were destined to become a potential class in the parliaments of England.

Siting of Parliament at Westminster.—Another constitutional change during this reign was that the summoning of parliament to Westminster instead of to various towns in different parts of the country. This custom invested parliament with the character of a settled institution, and constituted it a high court for the hearing of petitions and the redress of grievances. The growth of its judicature, as a court of appeal, was also favoured by the fixity of its place of meeting.

Authority of Parliament recognised by Law.—Great was the power of the Crown, and the king himself was bold and statesmanlike; but the union of classes against him proved too strong for prerogative. In 1207, having outraged the Church, the barons, and the Commons, by illegal exactions, he was forced to confirm the Great Charter and the Charter of Forests, with further securities against the taxation of the people without their consent and, in return, obtained timely subsidies from the parliament.

Henceforth the financial necessities of a succession of kings ensured the frequent assembling of parliaments. Nor were they long contented with the humble function of voting subsidies, but boldly insisted on the redress of grievances and further securities for national liberties. In 1322 it was declared by statute 15 Edw. II. that "the matters to be established for the estate of the king and of his heirs, and for the estate of the realm and of the people, should be treated, accorded, and established in parliament, by the king, and by the assent of the prelates, earls and barons, and the commonalty of the realm, according as had been before accustomed." The constitutional powers of the parliament as a legislature were here amply recognized—not by royal charter, or by the occasional exercise of prerogative, but by an authoritative statute. And these powers were soon to be exercised in a striking form. Already parliament had established the principle that the redress of grievances should have precedence of the grant of subsidies; it had maintained the right of approving councilors of the Crown, and punishing them for the abuse of their powers; and in 1327 the king himself was finally deposed, and the succession of his son, Edward III., declared by parliament.

Union of Knights of the Shire and Burgesses.—At this period the constitution of parliament was also settling down to its later and permanent shape. Hitherto the different orders or estates had deliberated separately, and agreed upon their several grants to the Crown. The knights of the shire were naturally drawn, by social ties and class interests, into alliance with the barons; but at length they joined the citizens and burgesses, and in the first parliament of Edward III. they are found sitting together as "the Commons."

This may be taken as the turning point in the political history of England. If all the landowners of the country had become united as an order of nobles, they might have proved too strong for the development of national liberties, while the union of the country gentlemen with the burgesses formed an estate of the realm which was destined to prevail over all other powers. The withdrawal of the clergy, who would probably have been led by the bishops to take part with themselves and the barons, further strengthened the united Commons.

Increasing Influence of Parliament.—The reign of Edward III. witnessed further advances in the authority of parliament, and changes in its constitution. The king, being in continual need of subsidies, was forced to summon parliament every year, and in order to encourage its liberality he frequently sought its advice when framing the measures of his administration, and readily entertained the petitions of the Commons praying for the redress of grievances. During this reign also, the advice and consent of the Commons, as well as of the Lords spiritual and temporal, was regularly recorded in the enacting part of every statute.

---

1 It now appears that substantially this was effected as early as 1275. The transition period between Simon de Montfort's parliament of 1265 and the "model parliament" of 1295 was long a puzzle to historians. In general for two centuries councils in 1283, no trace was found in the records, between 1265 and 1295, of the representation of cities or boroughs, or of representation of the counties between 1275 and 1290. But in 1910 Mr. C. Hilaire Jenkins (see English Historical Review, for April) found in some old documents which proved to be fragments of three writs and of returns of members for the Easter parliament of 1275. They make it certain that knights of the shire were then present, and that burgesses and citizens were summoned (as in 1275) through the mayors, but as since 1205 through the sheriffs). The importance of the 1295 parliament thus appears to be smaller in English constitutional history, the full reforms appearing to have been adopted 20 years earlier. It is noteworthy, however, that in the writs of 1275 the instruction to the sheriff is "venire facias," not "eligi facias." —[H. Ch.]
Separation of the Two Houses.—But a more important event is to be assigned to this reign,—the formal separation of parliament into the two houses of Lords and Commons. There is no evidence—nor is it probable—that the different estates ever voted together as a single assembly. It appears from the rolls of parliament that in the early part of this reign, the causes of summons having been declared to the assembled estates, the three estates deliberated separately, but afterwards delivered a collective answer to the king. While their deliberations were short they could be conducted apart, in the same chamber; but, in course of time, it was found convenient for the Commons to have a chamber of their own, and they adjourned their sittings to the chapter-house of the abbey of Westminster, where they continued to be held after the more formal and permanent separation had taken place. The date of this event is generally assigned to the 17th Edward III.

The Commons as Petitioners.—Parliament had now assumed its present outward form. But it was far from enjoying the authority which it acquired in later times. The Crown was still paramount; the small body of earls and barons—not exceeding 40—were connected with the royal family, or in the service of the king, or under his influence; the prelates, once distinguished by their independence, were now seekers of royal favour; and the Commons, though often able to extort concessions in return for their contributions to the royal exchequer, as yet held an inferior position among the estates of the realm. Instead of enjoying an equal share in the framing of laws, they appeared before the king in the humble guise of petitioners. Their petitions, together with the king's answers, were recorded in the rolls of parliament; but it was not until the parliament had been discharged from attendance that statutes were framed by the judges and entered on the statute rolls. Under such conditions legislation was, in truth, the prerogative of the Crown rather than of parliament. Enactments were often found in the statutes at variance with the petitions and royal answers, and neither prayed for by the Commons nor assented to by the Lords. In vain the Commons protested against so grave an abuse of royal authority; but the same practice was continued during this and succeeding reigns. Henry V., in the second year of his reign, promised "that nothing should be enacted to the petitions of the Commons, contrary to their asking, whereby they should be bound without their assent;" but, so long as the old method of framing laws was adhered to, there could be no security against abuse; and it was not until the reign of Henry VI. that the introduction of the more regular system of legislating by bill and statute ensured the thorough agreement of all the estates in the several provisions of the statutes.

Increasing Boldness of the Commons.—The Commons, however, notwithstanding these and other discouragements, were constantly growing bolder in the assertion of their rights. They now ventured to brave the displeasure of the king, without seeking to shelter themselves behind powerful barons, upon whose forwardness in the national cause they could not reckon. Notably in 1376 their stout Speaker, Peter de la Mare, inveighed, in their name, against the gross mismanagement of the war, impeached ministers of the realm, complained of the heavy burdens under which the people suffered, and even demanded that a true account should be rendered of the public expenditure. The brave Speaker was cast into prison, and a new parliament was summoned which speedily reversed the resolutions of the last. But the death of the king changed the aspect of affairs. Another parliament was called, when it was found that the spirit of the Commons was not subdued. Peter de la Mare was released from prison, and again elected to the chair. The demands of the former parliament were reiterated with greater boldness and persistence, the evil counsellors of the late reign were driven out, and it was conceded that the principal officers of state should be appointed and removed, during the minority of Richard II., upon the advice of the lords. The Commons also insisted upon the annual assembling of parliament under the stringent provisions of a binding law. They claimed the right, not only of voting subsidies, but of appropriating them, and of examining public accounts. They inquired into public abuses, and impeached ministers of the Crown. Even the king himself was deposed by the parliament. Thus during this reign all the great powers of parliament were asserted and exercised. The foreign wars of Henry IV. and Henry V., by continuing the financial necessities of the Crown, maintained for a while the powers which parliament had acquired by the struggles of centuries.

Relapse of Parliamentary Influence.—But a period of civil wars and disputed successions was now at hand, which checked the further development of parliamentary liberties. The effective power of a political institution is determined, not by assertions of authority, nor even by its legal recognition, but by the external forces by which it is supported, controlled or overborne. With the close of the Wars of the Roses the life of parliament seems to have well-nigh expired.

To this constitutional relapse various causes contributed at the same period. The Crown had recovered its absolute supremacy. The powerful baronage had been decimated on the battlefield and the scaffold; and vast estates had been confiscated to the Crown. Kings had no longer any dread of their prowess as defenders of their own order or party, or as leaders of the people. The royal treasury had been enriched by their ruin; while the close of a long succession of wars with France and Scotland relieved it of that continual drain which had reduced the Crown to an unwelcome dependence upon parliament. Not only were the fortunes of the baronage laid low, but feudalism was also dying out in England as on the continent. It was no longer a force which could control the Crown; and it was being further weakened by changes in the art of war. The mailed horseman, the battle-axe and cross-bow of the burgher and yeoman, could not cope with the cannon and arquebus of the royal army.

In earlier times the Church had often stood forth against the domination of kings, but now it was in passive submission to the Throne. The prelates were attracted to the court, and sought the highest offices of state; the inferior clergy had long been losing their influence over the laity by their ignorance and want of moral elevation at a period of increasing enlightenment; while the Church at large was weakened by schisms and a wider freedom of thought. Hence the Church, like the baronage, had ceased to be a check upon the Crown.

Meanwhile what had become of the ever-growing power of the Commons? It is true they had lost their stately leaders, the armed barons and outspoken prelates, but they had themselves advanced in numbers, riches and enlightenment; they had overthrown the status as knights and freeholders, or dwelt in populous towns enriched by merchandise. Why could they not find leaders of their own? Because they had lost the liberal franchises of an early age. All freeholders, or suitors present at the county court, were formerly entitled to vote for a knight of the shire; but in the eighth year of Henry VI. (1430) an act was passed (c. 37) by which this right was confined to 40s. freeholders, resident in the county. Large numbers of electors were thus disfranchised. In the view of parliament they were "of no value," and complaints had been made that they were under the influence of the nobles and greater landowners; but a popular element had been withdrawn from the county representation, and the restricted franchise cannot have impaired the influence of the nobles.

As for the cities and boroughs, they had virtually renounced their electoral privileges. As we have seen, they had never valued them very highly; and now by royal charters, or by the usurpation of small self-elected bodies of burgesses, the choice of members had fallen into the hands of town councils and neighbouring landowners. The anomalous system of close and nomination boroughs, which had arisen thus early in English history, was suffered to continue without a check for four centuries, as a notorious blot upon a free constitution.

All these changes exalted the prerogatives of the Crown. Amid all the clash of arms and the strife of hostile parties the voice of parliament had been stifled; and, when peace was restored, a
Queen Elizabeth and her Parliaments.—With the reign of Elizabeth commenced a new era in the life of parliament. She had received the royal prerogatives unlimited and her hand was strong enough to wield them. But in the long interval since Edward IV. the entire framework of English society had been changed; it was a new England that the queen was called upon to govern. The coarse barons of feudal times had been succeeded by English country gentlemen, beyond the influence of the court, and identified with all the interests and sympathies of their country neighbours. From this class were chosen nearly all the knights of the shire, and a considerable proportion of the members for cities and boroughs. They were generally distinguished by a manly independence, and were prepared to uphold the rights and privileges of parliament and the interests of their constituents. A change no less remarkable had occurred in other classes of society. The country was peopled with yeomen and farmers, far superior to the cultivators of the soil in feudal times; and the towns and seaports had grown into important centres of commerce and manufactures. Advances not less striking had been made in the enlightenment and culture of society. But, above all, recent religious revolutions had awakened a spirit of thought and inquiry by no means confined to questions of faith. The Puritans, hostile to the Church, and jealous of every semblance of Catholic revival, were embittered against the state, which was identified, in their eyes, with many ecclesiastical enormities; and stubborn temper was destined to become a strong motive force in restoring the authority of parliament.

The parliaments of Elizabeth, though rarely summoned, displayed an unaccustomed spirit. They discussed the succession to the Crown, the marriage of the queen, and ecclesiastical abuses; they upheld the privileges of the Commons and their right to advise the Crown upon all matters of state; and they condemned the grant of monopolies. The bold words of the Wentworths and Velsertons were such as had not been heard before in parliament. The conflicts between Elizabeth and the Commons marked the revival of the independence of parliament, and foreshadowed graver troubles at no distant period.

Conflicts of James I. with the Commons.—James I., with short-sighted pedantry, provoked a succession of conflicts with the Commons, in which abuses of prerogative were stoutly resisted and the rights and privileges of parliament resolutely asserted. The "remonstrance" of 1610 and the "protestation" of 1621 would have taught a politic ruler that the Commons could no longer be trifled with; but those lessons were lost upon James and upon his ill-fated son.

Charles I. and the Commonwealth.—The momentous struggles between Charles I. and his parliaments cannot be followed in this place. The earlier parliaments of this reign fairly represented the earnest and temperate judgment of the country. They were determined to obtain the redress of grievances and to restrain undue prerogatives; but there was no taint of disloyalty to the Crown; there were no dreams of revolution. But the contest at length became embittered, until there was no issue but the arbitration of the sword. The period of the Great Rebellion and the Commonwealth proved the supreme power of the Commons, when supported by popular forces. Everything gave way before them. They raised victorious armies in the field, they overthrew the Church and the House of Lords, and they brought the king himself to the scaffold. It also displayed the impotence of a parliament which has lost the confidence of the country, or is overborne by mobs, by an army, or by the strong will of a dictator.

Political Agitation of this Period.—It is to this time of fierce political passions that we trace the origin of political agitation as an organized method of influencing the deliberations of parliament. The whole country was then aroused by passionate exhortations from the pulpit and in the press. No less than thirty thousand political tracts and newspapers during this period have been preserved. Petitions to parliament were multiplied in order to strengthen the hands of the popular leaders. Clamorous meetings were held to stimulate or overawe
PARLIAMENT

parties. Such methods, restrained after the Restoration, have been revived in later times, and now form part of the acknowledged system of parliamentary government.

Parliament after the Restoration.—On the restoration of Charles II. parliament was at once restored to its old constitution, and its sittings were revived as if they had suffered no interruption. No outward change had been effected by the late revolution; but that a stronger spirit of resistance to abuses of prerogative had been aroused was soon to be disclosed in the deposition of James II. and "the glorious revolution" of 1688. At this time the full rights of parliament were explicitly declared, and securities taken for the maintenance of public liberties. The theory of a constitutional monarchy and a free parliament was established; but after two revolutions it is curious to observe the indirect methods by which the Commons were henceforth kept in subjection to the Crown and the territorial aristocracy. The representation had long become an illusion. The knights of the shire were the nominees of nobles and great landowners; the borough members were returned by the Crown, by noble patrons or close corporations; even the representation of cities, with greater pretensions to independence, was controlled by bribery. Nor were rulers content with their control of the representation, but, after the Restoration, the infamous system of bribing the members themselves became a recognized instrument of administration. The country gentlemen were not less attached to the principles of rational liberty than their fathers, and would have resisted further encroachments of prerogatives; but they were satisfied with the Revolution settlement and the remedial laws of William III., and no new issue had yet arisen to awaken opposition. Accordingly, they ranged themselves with one or other of the political parties into which parliament was now beginning to be divided, and bore their part in the more measured stife of the 18th century. From the Revolution till the reign of George III. the effective power of the state was wielded by the Crown, the Church and the territorial aristocracy; but the influence of public opinion in the stirring events of the 1790s, century had greatly increased. Both parties were constrained to defer to it; and, notwithstanding the flagrant defects in the representation, parliament generally kept itself in accord with the general sentiments of the country.

Union of Scotland.—On the union of Scotland in 1707 important changes were made in the constitution of parliament. The House of Lords was reinforced by the addition of sixteen peers, representing the peerage of Scotland, and elected every parliament; and the Scottish peers, as a body, were admitted to all the privileges of peerage, except the right of sitting in parliament or upon the trial of peers. No prerogative, however, was given to the Crown to create new peers without the union; and, while they are distinguished by their antiquity, their number is consequently decreasing. To the House of Commons were assigned forty-five members, representing the shires and burghs of Scotland.

Parliament under George III.—With the reign of George III., there opened a new period in the history of parliament. Agitation in its various forms, an active and aggressive press, public meetings and political associations, the free use of the right of petition, and a turbulent spirit among the people seriously changed the relations of parliament to the country. And the publication of debates, which was fully established in 1771, at once increased the direct responsibility of parliament to the people, and ultimately brought about other results, to which we shall presently advert.

Union of Ireland.—In this reign another important change was effected in the constitution of parliament. Upon the union with Ireland, in 1801, four Irish bishops were added to the lords spiritual, who sat by rotation of sessions, and represented the ecclesiastical body of the Church of Ireland. But those bishops were deprived of their seats in parliament in 1869, on the disestablishment of the Church of Ireland. Twenty-eight representative peers, elected for life by the peerage of Ireland, were admitted to the House of Lords. All the Irish peers were also entitled to the privilege of peerage. In two particulars the Irish peerage was treated in a different manner from the peerage of Scotland. The Crown was empowered to create a new Irish peer whenever three Irish peerages in existence at the time of the Union have become extinct, or when the number of Irish peers, exclusive of those holding peerages of the United Kingdom, has been reduced to one hundred. And, further, Irish peers were permitted to sit in the House of Commons for any place in Great Britain, forfeiting, however, the privilege of peerage while sitting in the lower house.

At the same time one hundred representatives of Ireland were added to the House of Commons. This addition raised the number of members to six hundred and fifty-eight. Parliament now became the parliament of the United Kingdom.

Schemes for Improving the Representation.—By the union of Scotland and Ireland the electoral abuses of those countries were combined with those of England. Notwithstanding a defective representation, however, parliament generally sustained its position as fairly embodying the political sentiments of its time. Public opinion had been awakened, and could not safely be ignored by any party in the state. Under a narrow and corrupt electoral system the ablest men in the country found an entrance into the House of Commons; and their rivalry and ambition ensured the acceptance of popular principles and the passing of many remedial measures. As society expanded, and new classes were called into existence, the pressure of public opinion upon the legislature was assuming a more decisive character. The grave defects of the representation were notorious, and some minor electoral abuses had been from time to time corrected. But the fundamental evils—nominations boroughs, limited rights of election, the sale of seats in parliament, the prevalence of bribery, and the enormous expense of elections—though constantly exposed, long held their ground against all assailants. So far back as 1770 Lord Chatham had denounced these flagrant abuses. "Before the end of this century," he said, "either the parliament will reform itself from within, or be reformed with a vengeance from without." In 1782, and again in 1783 and 1785, his distinguished son, William Pitt, condemned the abuses of the representation, and proposed schemes of parliamentary reform. In 1793 Mr. Grey (afterwards Earl Grey) submitted a motion on the same subject; but the excesses of the French Revolution, political troubles at home, and exhausting wars abroad discouraged the supporters of reform for many years. Under more favourable conditions the question assumed greater proportions. Lord John Russell especially distinguished himself in 1820, and in several succeeding years, by the able exposure of abuses and by temperate schemes of reform. His efforts were assisted by the scandalous disclosures of bribery at Grampound, Penry and East Retford. All moderate proposals were rejected; but the concurrence of a dissolution, on the death of George IV., with the French Revolution in 1830; and the, well-documented declaration of the duke of Wellington that the representation was perfect and could not be improved, suddenly precipitated the memorable crisis of parliamentary reform. It now fell to the lot of Earl Grey, as premier, to be the leader in a cause which he had espoused in his early youth.

The Reform Acts of 1832.—The result of the memorable struggle which ensued may be briefly told. By the Reform Acts of 1832 the representation of the United Kingdom was reconstructed. In England, fifty-six nomination boroughs returning one hundred and eleven members were disfranchised; thirty boroughs were each deprived of one member, and Weymouth and Melcombe Regis, which had returned four members, were now reduced to two. Means were thus found for the enfranchisement of populous places. Twenty-two large towns, including metropolitan districts, became entitled to return two members, and twenty less considerable towns acquired the right of returning one member each. The number of county members was increased from ninety-four to one hundred and fifty-nine, the larger counties being divided for the purposes of representation.
The elective franchise was also placed upon a new basis. In the boroughs a 10s household suffrage was substituted for the narrow and unequal franchises which had sprang up—"the rights of freemen, in corporate towns, being alone respected. In the counties, copyholders and leaseholders for terms of years, and tenants at will paying a rent of £5 a year, were added to the 4s. freeholders.

By the Scottish Reform Act the number of members representing Scotland was increased from forty-five, as arranged at the union, to fifty-three, of whom thirty were assigned to counties and twenty-three to cities and burghs. In counties the franchise was conferred upon owners of property of £10 a year, and certain classes of leaseholders; in burghs, upon £10 householders, as in England.

By the Irish Reform Act, no boroughs, however small, were disfranchised; but the franchise was given to £10 householders, and county constituencies were enlarged. These franchises, however, were extended in 1850, when an 8s household suffrage was given to the boroughs, and additions were made to the county franchises. The hundred members assigned to that country at the union were increased to one hundred and five. Notwithstanding these various changes, however, the total number of the House of Commons was still maintained at six hundred and fifty-eight, and the system of franchise was now brought into closer relations with the people, and became more sensitive to the pressure of popular forces. The immediate effects of this new spirit were perceptible in the increased legislative activity of the reformed parliament, its vigorous grappling with old abuses, and its preference of the public welfare to the narrower interests of classes. But, signal as was the regeneration of parliament, several electoral evils still needed correction. Strenuous efforts were made, with indifferent success, to overcome bribery and corruption, and proposals were often ineffectually made to restrain the undue influence of landlords and employers of labour by the ballot; improvements were made in the registration and polling of electors, and the property qualification of members was abolished. Complaints were also urged that the middle classes had been admitted to power, while the working classes were excluded from the late scheme of enfranchisement. It was not till 1867 however that any substantial advance was made.

**Increased Power of the Commons.**—Prior to the reign of Charles I, the condition of society had been such as naturally to subordiante the Commons to the Crown and the Lords. After the Revolution of 1688 society had so far advanced that, under a free representation, the Commons might have strutted with both upon equal terms. But, as by far the greater part of the representation was in the hands of the king and the territorial nobles, the large constitutional powers of the Commons were held safely in check. After 1832, when the representation became a reality, a corresponding authority was asserted by the Commons. For several years, indeed, by reason of the weakness of the Liberal party, the Lords were able successfully to resist the Commons upon many important occasions; but it was soon acknowledged that they must yield whenever a decisive majority of the Commons, supported by public opinion, insisted upon the passing of any measure, however repugnant to the sentiments of the upper house. And it became a political axiom that the Commons alone determined the fate of ministries.

**Later Measures of Reform.**—In 1852, and again in 1854, Lord John Russell introduced measures of parliamentary reform; but constitutional changes were discouraged by the Crimean War. In 1859 Lord Derby's Conservative government proposed another scheme of reform, which was defeated; and in 1866 Lord John Russell brought in another bill, which was not proceeded with; and the question of reform continued in abeyance until after the death of Lord Palmerston. Earl Russell, who succeeded him as premier, was prompt to redeem former pledges, and hastened to submit to a new parliament, in 1866, another scheme of reform. This measure, and the ministry by whom it was promoted, were overthrown by a combination of the Conservative opposition and the memorable "cave" of members of the Liberal party. But the popular sentiment in favour of reform, which had for some years been inert, was suddenly aroused by the defeat of a Liberal ministry and the triumph of the party opposed to reform. Lord Derby and his colleagues were now constrained to undertake the settlement of this embarrassing question; and by a strange concurrence of political events and party tactics a scheme far more democratic than that of the Liberal government was accepted by the same parliament, under the auspices of a Conservative ministry.

**The Reform Acts of 1867-1868.**—By the English Reform Act of 1867 four corrupt boroughs were disfranchised, and thirty-eight boroughs retaining two members were henceforth to return one only. A third member was given to Manchester, Liverpool, Birmingham and Leeds; a second member to Merthyr Tydfil and Salford; the Tower Hamlets were divided into two boroughs, each returning two members; and ten new boroughs were created, returning one member each, with the exception of Chelsea, to which two were assigned. By these changes twenty-six seats were taken from boroughs, while a member was given to the university of London. But before the end of 1869 the thirty-two boroughs, whose franchise was disfranchised by the Scottish Reform Act of 1868, these seats being given to Scotland. Thirteen new divisions of counties were erected, to which twenty-five members were assigned. In counties the franchise of copyholders and leaseholders was reduced from £10 to £5, and the occupation franchise from £50 to £12. In boroughs the franchise was extended to all occupiers of dwelling-houses rated to the poor-rates, and to lodgers occupying lodgings of the annual value of £50 unfranished. By the Scottish Reform Act of 1868, the number of members representing Scotland was increased from fifty-three to sixty—three new members being given to the shires, two to the universities, and two to cities and burghs. The county franchise was extended to owners of lands and heritages of £5 yearly value, and to occupiers of the rateable value of £14; and the burgh franchise to all occupiers of dwelling-houses paying rates, and to tenants of lodgings of £10 annual value unfranished.

By the Irish Reform Act of 1868 no change was made in the number of members nor in the distribution of seats; but the boroughs of Sligo and Cashel, already disfranchised, were still left without representation. The county franchise was extended to occupiers of houses rated at £4, and of lodgings of the annual value of £10 unfranished.

That these changes in the representation—especially the household suffrage in boroughs—were a notable advance upon the reforms of 1832, in the direction of democracy, cannot be questioned. The enlarged constituencies speedily overthrew the ministry to whom these measures were due; and the new parliament further extended the recent scheme of reform by granting to electors the protection of the ballot (g.v.), for which advanced reformers had contended since 1832. Nor was the existing representation long suffered to continue without question. First, it was proposed, in 1872, to extend the household franchise to counties, and this proposal found favour in the country and in the House of Commons; but, the Conservative party having been restored to power in 1874, no measure of that character could be promoted with any prospect of success. At the dissolution of 1880 a more general revision of the representation was advocated by leading members of the Liberal party, who were soon restored to power.

---

*T. E. M.; H. C. L.*

**Acts of 1884-1885.**—The Reform Act of 1884 was ultimately carried with the goodwill of both of the great political parties. The Conservatives resisted Mr Gladstone's attempt to carry a great extension of the franchise before he had disclosed his scheme of redistribution, and the bill was thrown out by the House of Lords in August 1884. But after a conference of Mr Gladstone with Lord Salisbury, to whom the whole scheme
was confided, an agreement was reached, and the bill was passed in the autumn session. In the following session (1885) the Redistribution Act was passed.

A uniform household and lodger franchise was established in counties and boroughs. If a dwelling was held as part payment for service, the occupier was not deprived of his vote because his home was the property of his master. The obligation was thrown on the overseers of ascertaining whether any other man besides the owner was entitled to be registered as an inhabitant occupier, and the owner was bound to supply the overseers with information. The Registration Acts were otherwise widely amended. Polling-places were multiplied, so that little time need be lost in recording a vote. These and other beneficial changes went a long way towards giving a vote to every one who had a decent home. By the Redistribution of Seats Act 1885 all boroughs with less than 15,000 inhabitants ceased to return a member. These small towns were merged into their counties, and the counties were subdivided into a great number of single-member constituencies, so that the inhabitants of the disfranchised boroughs voted for the member for the division of the county in which they were situated. Boroughs with less than 50,000 inhabitants returning two members were in future to return only one, and towns of over 100,000 were divided into separate constituencies, and received additional members in proportion to their population. The members for the City of London were reduced to two, but Greater London, including Croydon, returned sixty. Divided Liverpool returned nine, Glasgow seven, Edinburgh, Dublin and Belfast each four, and so on. Six additional seats were given to England and twelve to Scotland, so that, allowing for a diminution by disfranchisement for corruption, the numbers of the House of Commons were raised to 670 members.

Results of Reform since 1832.—From a constitutional standpoint it is important to recognize the results of the successive Reform Acts on the working of parliament as regards the position of the executive on the one hand and the electorate on the other. Before 1832 the functions of ministers were mainly administrative, and parliament was able to deal much as it pleased with their rare legislative proposals without thereby depriving them of office. Moreover, since before that date ministers were, generally speaking, in fact as well as in theory appointed by the king, while the general confidence of the majority in the House of Commons followed the confidence not so much of the electorate as of the Crown, that house was able on occasions to exercise an effective control over foreign policy. Pitt, after 1784, was defeated several times on foreign and domestic issues, yet his resignation was neither expected nor desired. In 1788, when the regency of the Prince of Wales appeared probable, and again in 1812, it was generally assumed that it would be in his power to dismiss his father's ministers and to maintain the Whigs in office without dissolving parliament. This system, while it gave to ministers security of tenure, left much effective freedom of action to the House of Commons. But the Reform Act of 1832 struck at the root of this system. In 1835 the result of a general election was for the first time the direct cause of a change of ministry, and in 1842 a House of Commons was elected for the express purpose of bringing a particular statesman into power. The electorate voted for Sir Robert Peel, and it would have been as impossible for the house then elected to deny him their support as it would be for the college of electors in the United States to exercise their private judgment in the selection of a president. As time went on, and the party system became more closely organized in the enlarged electorate, the voting power throughout the country came to exercise an increasing influence. The premier was now a party leader who derived his power in reality neither from the Crown nor from parliament, but from the electorate, and to the electorate he could appeal if deserted by his parliamentary majority. Unless it was prepared to drive him from the office in which it was elected to support him, that majority would not venture to defeat, or even seriously to modify, his legislative proposals, or to pass any censure on his foreign policy, for all such action would now be held to be equivalent to a vote of no confidence. From the passing of the Reform Act of 1832 down to 1900 (with a single exception due to the lowering of the franchise and the redistribution of seats) the electorate voted alternately for the rival party leaders, and it was the function of the houses elected for that purpose to pass the measures and to endorse the general policy with which those leaders were respectively identified. The cabinet (g.v.), composed of colleagues selected by the prime minister, had practically, though indirectly, become an executive committee acting on behalf of the electorate, that is to say, the majority which returned their party to office; and the House of Commons practically ceased to exercise control over ministers except in so far as a revolt in the party forming the majority could influence the prime minister, or force him to resign or dissolve. Meanwhile, the virtual identification of the electorate with the nation by the successive extensions of the franchise added immensely to its power, the chief limitation being supplied by the Septennial Act. The House of Lords, whatever its nominal rights, came henceforth in practice to exercise restriction rather on the House of Commons than on the will of the electorate, for the acquiescence of the upper house in the decision of the electors, when appealed to on a specific point of issue between the two houses, was gradually accepted by its leaders as a constitutional convention.

The history of parliament, as an institution, centres in this later period round two points, (A) the friction between Lords and Commons, resulting in proposals for the remodelling of the upper house, and (B) the changes in procedure within the House of Commons, necessitated by new conditions of work and the desire to make it a more business-like assembly. These two movements will be discussed separately.

A. House of Lords Question.—In the altered position of the House of Lords, the occasional checks given by it to the House of Commons were bound to cause friction with the representatives of the people. In the nature of things this was a matter of importance only when the Liberal party was in power and measures were proposed by the Liberal leaders which involved such extreme changes that the preponderantly Conservative upper house could amend or reject them with some confidence in its action being supported by the electorate. The frequent differences between the two houses during the parliament of 1880–1885, culminating in the postponement by the upper house of the Reform Bill, caused the status of that house to be much discussed during the general election of 1885, and proposals for its “mending or ending” to be freely canvassed on Radical platforms. On the 5th of March 1886 Mr Labouchere moved a resolution in the House of Commons condemning the hereditary principle. This was resisted by Mr Gladstone, then prime minister, on the ground that he had never supported an abstract motion unless he was prepared to follow it up by action, and that the time for this had not arrived. On a division the motion was negatived by 202 votes against 166. The previous vote of the House of Lords was much agitated in 1888. The Conservative party was in power, but many of them thought that it would be prudent to forestall by a moderate reform the more drastic remedies now openly advocated by their opponents. On the other hand, Radicals were disposed to resist all changes involving the maintenance of the hereditary principle, lest they should thereby strengthen the House of Lords. On the 9th of March Mr Labouchere again moved his resolution in the House of Commons. Mr W. H. Smith, the leader of the house, in resisting the motion, admitted that some changes were desirable, and agreed with a previous speaker that it was by the Conservatives that such changes ought to be effected. On the 19th of March in the same year Lord Rosebery, in the House of Lords, moved for a select committee to inquire into the subject. He took the opportunity to explain his own plan of reform. While he did not wish to abolish the hereditary principle, he desired that no peer, outside the Royal family, should be a member of the house by right of birth alone. To the representatives of the peers
he proposed to add other men who had achieved distinction in a public career. He attached a high importance to the existence of a second chamber. His motion, was negatived by 97 votes against 50. On the 26th of April Lord Dunraven withdrew a bill for the reform of the House of Lords on the promise of the government to deal with the matter, and on the 18th of June Lord Salisbury fulfilled this pledge. He introduced a bill on that day to provide for the creation of a limited number of life peers and for the exclusion of unworthy members from the house. Under this measure a maximum of five life-peers in any one year might be created, but the total number was never to exceed fifty. In respect of three out of these five life-peers the choice of the Crown was restricted to judges, generals, admirals, ambassadors, privy councillors and ex-governors of colonies. The two additional life-peers were to be appointed in regard to some special qualification to be stated in the message to the house announcing the intention of the Crown to make the appointment. Power was also to be given to the house to expel members for the period of the current parliament by an address to the Crown praying that their writs of summons might be cancelled. The bill was read a second time on the 20th of July, but it met with a cold reception and was dropped. The only outcome of all that was written and said in the debates was that in 1880 a new House of Lords was set up in 1888, the Lords made a few changes in their standing orders, among which the order establishing a quorum of thirty in divisions and those for the constitution of standing committees were the most important.

The parliament which met at Westminster in August 1892 was more democratic in its tendencies than any of its predecessors. At the beginning of the session of 1893, in the course of which the Home Rule Bill was passed by the House of Commons, government bills were introduced for quinquennial parliaments, for the amendment of registration, and for the limitation of each elector to a single vote. The introduction of these bills served merely as a declaration of government policy, and they were not further pressed. On the 24th of March a resolution in favour of payment of members was carried by 276 votes against 229, and again in 1893 by 176 to 158. But the rejection of the Home Rule Bill by the House of Lords, with the apparent acquiescence of the country, combined with the retirement of Mr Gladstone, rendered the House of Lords of this House of Commons the smallest importance was attached to its abstract resolutions. In the ensuing session of 1894 an amendment to the Address condemning the hereditary principle was moved by Mr Labouchere, and carried by 147 to 145. The government, however, holding that this was not the way in which a great question should be raised, withdrew the Address, and carried another without the insertion. In his last public utterance Mr Gladstone directed the attention of his party to the reform of the House of Lords, and Lord Rosebery endeavoured to concentrate on such a policy the energies of his supporters at the general election. But the result of the dissolution of 1895, showing, as it did, that on the chief political issue of the day the electorate had agreed with the House of Lords and had disagreed with the House of Commons, greatly strengthened the upper house, and after that date the subject was but little discussed until the Liberal party again came into power ten years later. The House of Lords claimed the right to resist changes made by the House of Commons until the will of the people had been definitely declared, and its defenders contended that its ultimate importance was the eleventh hour not generally acknowledged, rendered the freedom from ministerial control secured to it by its constitution a national safeguard.

In 1907, under the Radical government of Sir H. Campbell-Bannerman (q.v.), the conflict between the Commons and the Lords again became more acute. And the prime minister in May obtained a large majority in the lower house for a resolution, on which a bill was to be founded, involving a complicated method of overruling the will of the Lords when the Commons had three times passed a bill. But no further immediate step was taken. In 1908 a strong committee of the House of Lords with Lord Rosebery as chairman, which had been appointed in consequence of the introduction by Lord Newton of a bill for reforming the constitution of the upper house, presented an interim report in favour of a committee rejecting the hereditary element and adopting a method of selection.

So the question stood when in 1909 matters came to a head through the introduction of Mr Lloyd George’s budget. It had always been accepted as the constitutional right of the House of Lords to reject a financial measure sent up by the Commons but not to amend it, but the rejection of the budget (which was, in point of form, referred to the judgment of the electorate) now precipitated a struggle with the Liberal party, who had persistently denied any right on the part of the upper house to force a dissolution. The Liberal leaders contended that, even if constitutional, the claim of the House of Lords to reject a budget was practically obsolete, and having been revived must now be formally abolished; and they went to the country for a mandate to carry their view into law. The elections of January 1910 gave an unsatisfactory answer, since the two principal parties, the Liberals and the Unionists, returned practically equal; but the Liberal government had also on their side the Irish Nationalist and the Labour parties, which gave them a majority in the House of Commons if they could concentrate the combined forces on the new measure. This they succeeded in doing; and having introduced and carried through the House of Commons a series of resolutions defining his proposals, he had also tabled a bill which was to be sent up to the House of Lords, when the death of the king suddenly interrupted the course of the constitutional conflict, and gave a breathing-space for both sides to consider the possibility of coming to terms. In June Mr Asquith took the initiative in inviting the leaders of the Opposition to a conference with closed doors, and a series of meetings between four representatives of each side were begun. The government were represented by Mr Asquith, Mr Lloyd George, Mr Birrell and Lord Crewe. The Unionists were represented by Mr Balfour, Lord Lansdowne, Mr Austin Chamberlain and Lord Cawdor.

The situation on the Radical side at this juncture may be best understood by setting out the resolutions passed in the House of Commons, and the text of the parliament bill of which Mr Asquith had given notice:

The Resolutions.—

1. That it is expedient that the House of Lords be disabled by law from rejecting or amending a money bill, but that any such limitation by law shall not be taken to diminish or derogate on the existing rights and privileges of the House of Commons.

For the purpose of this resolution, a bill shall be considered a money bill if in the opinion of the Speaker it contains only provisions dealing with all or any of the following subjects—namely, supplies for the public service of the United Kingdom; charges on the Consolidated Fund or the provision of money by parliament; supply; the appropriations, control or regulation of public money; the raising or guarantee of any loan or the repayment thereof; or matters incidental to those subjects or any of them.

2. That it is expedient that the powers of the House of Lords, as respects bills other than money bills, be restricted by law, so that such bill which has passed the House of Commons in three successive sessions and, having been sent up to the House of Lords at least one month before the end of the session, has been rejected by that house in each of those sessions, shall become law when the House of Commons shall have given its assent being declared: provided that at least two years shall have elapsed between the date of the first introduction of the bill in the House of Commons and the date on which it passes the House of Commons for the third time.

For the purpose of this resolution a bill shall be treated as rejected by the House of Lords if it has not been passed by the House of Lords either without amendment or with such amendments only as may be agreed upon by both houses.

That it is expedient to limit the duration of a parliament to five years.

The Parliament Bill, 1910.— Whereas it is expedient that provision should be made for regulating the relations between the two branches of the legislature, and whereas the House of Lords has, by the present constitution of the House of Lords, as it at present exists a second chamber constituted on a popular instead of hereditary basis, but such substitution cannot be immediately brought into operation: And whereas provision will hereafter be made by parliament in a measure effecting such substitution for limiting and defining the powers of the new second-chamber, but it is expedient
to make such provision as in this act appears for restricting the existing powers of the House of Lords: Be it therefore enacted by the king's most excellent majesty, by and with the advice and consent of the Lords spiritual and temporal, and Commons, in this present parliament assembled, and by the authority of the same as follows:

1. (1) If a money bill, having been passed by the House of Commons, and sent up to the House of Lords at least one month before the end of the session, is not returned by the House of Lords without amendment within one month after it is so sent up to that house, the bill shall, unless the House of Commons direct to the contrary, be presented to His Majesty and become an act of parliament or the House of Lords is not convened, notwithstanding that the House of Lords have not consented to the bill.

(2) A money bill means a bill which in the opinion of the Speaker of the House of Commons contains only provisions dealing with all or any of the following subjects— namely, the imposition, remission or regulation of taxation; charges on the consolidated fund or the provision of money by parliament; supply; the appropriation, control or regulation of public money; the raising or guarantee of any loan or the raising thereof; or making or accepting any contract or any of them.

(3) When a bill to which the House of Lords have not consented is presented to His Majesty for assent as a money bill, the bill shall be accompanied by a certificate of the Speaker of the House of Commons that it is a money bill.

(4) No amendment shall be allowed to a money bill which, in the opinion of the Speaker of the House of Commons, is such as to prevent the bill retaining the character of a money bill, or shall be passed by the House of Commons in three successive sessions (whether of the same parliament or not), and, having been sent up to the House of Lords at least one month before the end of the session, is rejected by the House of Lords without amendment within one month after it is so sent up to that house, unless the House of Commons direct to the contrary, be presented to His Majesty and become an act of parliament on the royal assent being granted thereto, or that such bill shall be rejected for the third time by the House of Lords, unless the House of Commons, by a resolution of the House of Lords, shall have been deemed to have been rejected by the House of Lords for the third time.

(2) A bill shall be deemed to be rejected by the House of Lords if it is not passed by the House of Lords either without amendment or with amendment not approved by both houses, or if it is not passed by both houses within three years, and by both houses within six years, of its presentation to the House of Lords.

(3) A bill shall be deemed to be the same bill as a former bill sent up to the House of Lords in the preceding session if, when it is sent up to the House of Lords, it is identical with the former bill or contains such alterations as are certified by the Speaker of the House of Commons to be necessary owing to the time which has elapsed since the date of the former bill, or to represent amendments which have been made by the House of Lords in the former bill in previous amendments.

Provided that the House of Commons may, if they think fit, on the passage of such a bill through the house in the second or third session, suggest any further amendments without inserting the provisions of the bill, and any such amendments shall be considered by the House of Lords, and if agreed to by that house, shall be treated as amendments made by the House of Lords and agreed to by the House of Commons; but the exercise of this power by the House of Lords shall not affect the operation of this section in the event of the bill being rejected by the House of Lords.

4. Any certificate of the Speaker of the House of Commons given under this act shall be conclusive for all purposes, and shall not be questioned in any court of law.

5. Nothing in this act shall diminish or qualify the existing rights and priviliges of the House of Commons.

6. The said act shall be in force for the space of four years only, and shall cease, at the expiration thereof, to operate for the maximum period of duration of parliament under the Septennial Act 1717.

Meanwhile, in the House of Lords, Lord Rosebery had carried three resolutions declaring certain principles for the reform of the second chamber, which were assented to by the Unionist leaders; the policy opposed to that of the government thus became that of willingness for reform of the constitution of the Upper Chamber, but not for abolition of its powers.

Lord Rosebery's Resolutions.—(1) "That a strong and efficient Second Chamber is not merely an integral part of the British Constitution, but is necessary, not only to the maintenance of the State and to the preservation of the Constitution, but also to the interests of the country.

(2) "Such a Chamber can best be obtained by the reform and reconstitution of the House of Lords."

(3) "That a necessary preliminary to such reform and reconstitution is the acceptance of the principle that the possession of a peerage should no longer of itself give the right to sit and vote in the House of Lords."

During the summer and autumn the private meetings between the eight leaders were continued, until twenty had been held. But on the roth of November Mr Asquith issued a brief statement that the conference on the constitutional question had come to an end, without arriving at an agreement. Within a few days he announced that another appeal would at once be made to the electorate. The Parliament Bill was hurriedly introduced into the House of Lords, with a statement by Lord Crewe that no amendments would be accepted. The dissolution was fixed for the 28th of November. Time was short for any declaration of policy by the Unionist peers, but it was given shape at once, first by the adoption of a further resolution moved by Lord Rosebery for the remodelling of the Upper House, and secondly by Lord Lansdowne's shelving the Parliament Bill by coupling the adjournment of the debate on it with the adoption of resolutions providing for the settlement of differences between a reconstituted Upper House and the House of Commons.

Lord Rosebery's additional resolution provided that "in future the House of Lords shall consist of Lords of Parliament: (a) chosen by the whole body of hereditary peers from among themselves and by nomination by the Crown; (b) sitting by virtue of offices and of qualifications held by them; (c) chosen from outside."

"2. Any amendment shall be allowed to a money bill which, in the opinion of the Speaker of the House of Commons, is such as to prevent the bill retaining the character of a money bill, or shall be passed by the House of Commons in three successive sessions (whether of the same parliament or not), and, having been sent up to the House of Lords at least one month before the end of the session, is rejected by the House of Lords without amendment within one month after it is so sent up to that house, unless the House of Commons direct to the contrary, be presented to His Majesty and become an act of parliament on the royal assent being granted thereto, or that such bill shall be rejected for the third time by the House of Lords, unless the House of Commons, by a resolution of the House of Lords, shall have been deemed to have been rejected by the House of Lords for the third time.

"(2) A bill shall be deemed to be rejected by the House of Lords if it is not passed by the House of Lords either without amendment or with amendment not approved by both houses, or if it is not passed by both houses within three years, and by both houses within six years, of its presentation to the House of Lords.

"(3) A bill shall be deemed to be the same bill as a former bill sent up to the House of Lords in the preceding session if, when it is sent up to the House of Lords, it is identical with the former bill or contains such alterations as are certified by the Speaker of the House of Commons to be necessary owing to the time which has elapsed since the date of the former bill, or to represent amendments which have been made by the House of Lords in the former bill in previous amendments.

Provided that the House of Commons may, if they think fit, on the passage of such a bill through the house in the second or third session, suggest any further amendments without inserting the provisions of the bill, and any such amendments shall be considered by the House of Lords, and if agreed to by that house, shall be treated as amendments made by the House of Lords and agreed to by the House of Commons; but the exercise of this power by the House of Lords shall not affect the operation of this section in the event of the bill being rejected by the House of Lords.

4. Any certificate of the Speaker of the House of Commons given under this act shall be conclusive for all purposes, and shall not be questioned in any court of law.

5. Nothing in this act shall diminish or qualify the existing rights and priviliges of the House of Commons.

6. The said act shall be in force for the space of four years only, and shall cease, at the expiration thereof, to operate for the maximum period of duration of parliament under the Septennial Act 1717."
in one session, his suspension on the third occasion should continue for a week, and until a motion had been made upon which it should be decided, at one sitting, by the house, whether the suspension should then cease or not. The general election, which took place two months later, restored Mr Gladstone to power and to the leadership of the house. Mr Parnell returned to parliament with a more numerous following, and resumed his former tactics. In January 1881 the Protection of Persons and Property (Ireland) Bill was introduced. For twenty-two hours Parnell fought the motion giving precedence to the bill, and for four sittings its introduction. The fourth sitting lasted forty-one hours. Then Mr Speaker Brand intervened, and declined to call on any other member who might rise to address the house, because repeated dilatory motions had been supported by small minorities in opposition to the general sense of the house. He added: "A crisis has thus arisen which demands the prompt interposition of the chair and of the house. The usual rules have proved powerless to ensure orderly and effective debate. An important measure, recommended by Her Majesty nearly a month since, and declared to be urgent in the interests of the state by a decisive majority, is being arrested by the action of an inconsiderable minority, the members of which have resorted to those modes of obstruction which have been recognized by the house as a parliamentary offence. The dignity, the credit, and the authority of this house are seriously threatened, and it is necessary they should be vindicated. . . . Future measures for ensuring orderly debate I must leave to the judgment of the house. But the house must either assume more effectual control over its debates, or entrust greater powers to the chair." The Speaker then put the question, which was carried by an overwhelming majority. Then followed the decisive struggle. Mr Gladstone gave notice for the next day (Feb. 3) of an urgency rule, which ordered, "That if the house shall resolve by a majority of three to one that the state of public business is urgent, the whole power of the house to make rules shall be and remain with the Speaker until he shall declare that the state of public business is no longer urgent." On the next day a scene of great disorder ended in the suspension of the Nationalist members, at first singly, and afterwards in groups. The urgency rule was then passed without further difficulty, and the house proceeded to resolve, "That the state of public business is urgent." The Speaker laid upon the table rules of sufficient stringency, and while they remained in force progress in public business was possible. During this session the Speaker had to intervene on points of order 935 times, and the chairman of committees 939 times; so that, allowing only five minutes on each occasion, the wrangling between the chair and members occupied 150 hours.

The events of the session of 1881 and the direct appeal of the Speaker to the house proved the necessity of changes in the rules of procedure more drastic than had heretofore been proposed. Accordingly, in the first week of the session of 1882 Mr Gladstone laid his proposals on the table, and in moving the first resolution on 20th February, he reviewed, in an eloquent speech, the history of the standing orders. It was his opinion, on general grounds, that the house should settle its own procedure, but he showed that the numerous committees which, since 1832, had sat on the subject, had failed for the most part to carry their recommendations into effect from the lack of the requisite "propelling power," and he expressed his regret that the concentration of this power in the hands of the government had rendered it necessary that they should undertake a task not properly theirs. He noted two main features in the history of the case: (1) the constantly increasing labours of the house, and (2) its constantly decreasing power to despatch its duties; and while he declared that "the fundamental change which has occurred is owing to the passing of the first great Reform Bill," he pointed out that the strain had not become intolerable till the development in recent years of obstructive tactics. He defined obstruction as "the disposition either of the minority of the house, or of individuals, to resist the prevailing will of the house otherwise than by argument," and reached the conclusion that the only remedy for a state of things by which the dignity and efficiency of the house were alike compromised, was the adoption in a carefully guarded form of the process known on the Continent as the "clôture." He explained that in his early years the house was virtually possessed of a closing power, because it was possessed of a means of sufficiently making known its inclinations; and to those inclinations uniform deference was paid by members, but that since this moral sanction had ceased to be operative, it was necessary to substitute, for it a written law. The power to close debate had been of necessity assumed by almost all the European and American assemblies, the conduct of whose members was shaped by no traditional considerations; and the entry into parliament of a body of men to whom the traditions of the house were as nothing made it necessary for the House of Commons to follow this example. He proposed, therefore, that when it appeared to the Speaker, or to the chairman of committees, during any debate to be the evident sense of the house, or of the committee, that the question be now put, he might so inform the house, and that thereupon on a motion being made, "That the question be now put," the question under discussion should be forthwith put from the chair, and decided in the affirmative if supported by more than 200 members, or, when less than 40 members had voted against it, by more than 100 members. This resolution was vehemently contested by the opposition, who denounced it as an unprecedented interference with the liberty of debate, but was eventually carried in the autumn session of the same year, after a discussion extending over nineteen sittings.

On the 20th of November the standing order of the 28th of February 1880, providing for the suspension of members who persistently and wilfully obstructed the business of the house or disregarded the authority of the chair, was amended by the increase of the penalty to suspension on the first occasion for one week, on the second occasion for a fortnight, and on the third, or any subsequent occasion, for a month. The other rules, framed with a view to freeing the wheels of the parliamentary machine, and for the most part identical with the regulations adopted by Mr Speaker Brand under the urgency resolution of 1881, were carried in the course of the autumn session, and became standing orders on the 27th of November.

Mr Gladstone's closure rule verified neither the hopes of its supporters nor the fears of its opponents. It was not put into operation until the 20th of February 1885, when the Speaker's declaration of the evident sense of the house was ratified by a majority of 207—a margin of but seven votes over the necessary quorum. It was clear that no Speaker was likely to run the risk of a rebuff by again assuming the initiative unless in the face of extreme urgency, and, in fact, the rule was enforced twice only during the five years of its existence.

In 1887 the Conservative government, before the introduction of the Crimes Act for Ireland, gave efficacy to the rule by an important amendment. They proposed that any member during a debate might claim to move, "That the question be now put," and that with the consent of the chair this question should be put forthwith, and decided without amendment or debate. Thus the initiative was transferred from the Speaker to the house. Mr Gladstone objected strongly to this alteration, chiefly on the ground that it would throw an unfair burden of responsibility upon the Speaker, who would now have to decide on a question of opinion, whereas under the old rule he was only called upon to determine a question of evident fact. The alternative most generally advocated by the opposition was the automatic closure by a bare majority at the end of each sitting, an arrangement by which the chair would be relieved from an invidious responsibility; but it was pointed out that under such a system the length of debates would not vary with the importance of the questions debated. After fourteen sittings the closure rule was passed on the 18th of March and made a standing order.

In the next session, on the 28th of February 1888, the rule was yet further strengthened by the reduction of the majority necessary for its enforcement from 200 to 100, the closure rule remaining as follows—
That, after a question has been proposed, a member rising in his place may claim to move, "That the question be now put," and, unless it shall appear to the chair that such motion is an abuse of the rules of the house or an infringement of the rights of the minority, the question shall be put forthwith, and decided without amendment or debate.

When the motion, "That the question be now put," has been carried, and the question consequent thereon has been decided, any further question made (the affirmative of the question having been withheld), which may be requisite to bring to a decision any question already proposed from the chair; and also if a clause be then under consideration, a motion may be made (the assent of the chair not having been withheld), "That the question 'That certain words of the clause defined in the motion stand part of the clause,' or 'That the clause stand part of the bill,' be put forthwith;" such motions shall be put forthwith, and decided without amendment or debate.

That questions for the closure of debate shall be decided in the affirmative, if, when a division be taken, it appears by the numbers declaring for the affirmative to have been voted in the majority in support of the motion.

The closure, originally brought into being to defeat the tactics of obstruction in special emergencies, thus became a part of parliamentary routine. And, the principle being once accepted, its operation was soon extended.

The practice of retarding the progress of government measures by amendments moved to every line, adopted by both the great political parties when in opposition, led to the use of what became known as the guillotine, for forcing through parliament important bills, most of the clauses of which became thus "guillotined." This means that the house decides how much time shall be devoted to certain stages of a measure, definite dates being laid down at which the closure shall be enforced and divided taken. On the 17th of June 1887, after prolonged debates on the Crimes Bill in committee, clause 6 only having been reached, the remaining 14 clauses were put without discussion, and the bill was reported in accordance with previous notice. This was the first use of the "guillotine," but the precedent was followed by Mr Gladstone in 1893, when many of the clauses of the Home Rule Bill were carried through committee and on report by the same machinery. To the Conservatives must be imputed the invention of this method of legislation, to their opponents the use of it for attempting to carry a great constitutional innovation to which the majority of English and Scottish representatives were opposed, and subsequently its extension and development (1906–1909) as a regular part of the legislative machinery.

The principle of closure has been extended even to the debates on supply. The old rule, that the redress of grievances should precede the granting of money, dating from a time when the minister of the Crown was so far from commanding the confidence of the majority in the House of Commons that he was the chief object of their attacks, nevertheless continued to govern the proceedings of the house in relation to supply without much resultant inconvenience, until the period when the new methods adopted by the Irish Nationalist party created a new situation. Until 1872 it continued to be possible to discuss any subject by an amendment to the motion going into supply. In that year a resolution was passed limiting amendments to matters relevant to the class of estimates about to be considered, and these relevant amendments were further restricted to the first day on which it was proposed to go into committee. This resolution was continued in 1873, but was allowed to drop in 1874. It was revived in a modified form in 1876, but was again allowed to drop in 1877. In 1879, on the recommendation of the Northcote committee, it was provided in a sessional order that whenever the committees of supply of ways and means stood as the first order on a Monday, the Speaker should leave the chair without question put, except on first going into committee on the army, navy and civil service estimates respectively. In 1882 Thursday was added to Monday for the purposes of the order, with some further exceptions having been made to the operation of the rule, it became a standing order. The conditions, however, under which the estimates were voted remained unsatisfactory. The most useful function of the opposition is the exposure of abuses in the various departments of administration, and this can best be performed upon the estimates. But ministers, occupied with their legislative proposals, were irresistibly tempted to postpone the consideration of the estimates until the last weeks of the session, when they were hurried through thin houses, the members of which were impatient to be gone. To meet this abuse, and to distribute the time with some regard to the comparative importance of the subjects discussed, Mr Balfour in 1896 proposed and carried a sessional order for the closure of supply, a maximum of twenty-three days being given to its consideration, of which the last three alone might be taken after the 5th of August. On the last but one of the allotted days at 10 o'clock the chairman was to put the outstanding votes, and on the last day the Speaker was to put the remaining questions necessary to complete the reports of supply. In 1901 Mr Balfour so altered the resolution that the question was put, not with respect to each vote, but to each class of votes in the Civil Service estimates, and to the total amounts of the outstanding votes in the army, navy and revenue estimates.

It is only possible here to refer briefly to some other changes in the procedure of the house which altered in various respects its character as a business-like assembly. The chief of these is as regards the hours. On Mondays, Tuesdays, Wednesdays and Thursdays the house meets at 2.45 p.m., "questions" beginning at 3 and ending (apart from urgency) at 3.45; and opposed business ends at 11. On Fridays the house meets at 12 noon, and opposed business is suspended at 5 p.m.; this is the only day when government business has not proceeded, and private members' bills have the first call, though at 8.15 p.m. on Tuesdays and Wednesdays up to Easter and on Wednesdays up to Whitsuntide the business is interrupted in order that private members' motions may be taken. These arrangements, which only date from 1906, represent a considerable change from the old days before 1879 when the standing order was formed that no opposed business, with certain exceptions, should be taken after 12.30 a.m., or 1888 when the closing hour was fixed at midnight. In fact the hours of the house have become generally earlier. Another important change has been made as regards motions for the adjournment of the house, which used to afford an opportunity to the private members at any time to discuss matters of urgent importance. Since 1902 no motion for the adjournment of the house may be made until all "guillotine" has been disposed of, and then, if forty members support it, the debate is taken up at 8.15 p.m. This alteration has much modified the character of the debates on such motions, which used to be taken when feelings were hot, whereas now there is time for reflection. In other respects the most noticeable thing in the recent evolution of the House of Commons has been its steady loss of power, as an assembly, in face of the control of the government and party leaders. In former times the private members had far larger opportunities for introducing and carrying bills, which now have no chance, unless the government affords "facilities"; and the great function of debating "supply" has largely been restricted by the closure, under which millions of money are voted without debate. Law is still done by the technical rules of procedure which are, in the main, dilatory and obstructive, and the expression of views which are distasteful to the Whips or to the government, who can by them arrange the business so as to suit their convenience. It is true indeed that this dilatory character of the proceedings assists to encourage debate, within limits; but with the influx of a new class of representatives, especially the Labour members, there has been in recent years a rather pronounced feeling that the procedure of the house might well be drastically revised with the object of making it a more business-like assembly. Reform of the House of Commons has been postponed to some extent because reform of the House of Lords has, to professors reformers, been a better "cry"; but it is once in the air in parliament it is not likely to stop, with so large a field of antiquated procedure before it as is represented by many of the traditional methods of the House of Commons.

(H. C.)
PARMA, a town and episcopal see of Emilia, Italy, capital of the province of Parma, situated on the Parma, a tributary of the Po, 55 m. N.W. of Bologna by rail. Pop. (1900), 48,583. Parma, one of the finest cities of northern Italy, lies in a fertile tract of the Lombard plain, within view of the Alps and sheltered by the Apennines, 170 ft. above sea-level. From south to north it is traversed by the channel of the Parma, crossed here by three bridges; and from east to west runs the line of the Via Aemilia, by which ancient Parma was connected on the one hand with Ariminum (Rimini), and on the other with Placentia (Piacenza). The old ramparts and bastions (excluding the circuit of thecitadel of 1591, now in great part demolished, in the south-east) make an enceinte of about 45 m., but the enclosed area is not all occupied by streets and houses.

In the centre of the city the Via Aemilia widens out into the Piazza Garibaldi, a large square which contains the Palazzo del Governo and the Palazzo Municipale, both dating from 1627. The cathedral of the Assumption (originally S. Herculanus), erected between 1064 and 1074, and consecrated in 1106 by Pope Paschal II., is a Lombard-Romanesque building in the form of a Latin cross. The severe west front is relieved by three rows of columns and arches, and has a central porch (there were at one time three) supported by huge red marble lions, sculptured no doubt with the rest of the façade by Giovanni Bono da Bissone in 1281. On the south side of the façade is a large brick campainile, and the foundations of another may be seen on the north. The walls and ceiling of the fine Romanesque interior are covered with frescoes of 1370, subdued in colour and well suited to the character of the building; those of the octagonal cupola representing the Assumption of the Virgin are by Correggio, but much restored. The crypt contains the shrine of the Bishop S. Bernardino degli Uberti and the tomb of Bartolommeo Prato—the former by Prospero Clementi di Reggio. In the sacristy are fine tarsius. To the south-west of the cathedral stands the baptistry, designed by Benedicto Antelami; it was begun in 1106 and not completed till 1281. The whole structure is composed of red and grey Verona marble. Externally it is an irregular octagon, each face consisting of a lower storey with a semicircular arch (in three cases occupied by a portal), with sculptures by Antelami, four tiers of small columns supporting as many continuous architraves, and forming open galleries, and above these (an addition of the Gothic period) a row of five engaged columns supporting a series of pointed arches and a cornice. Internally it is a polygon of unequal sides, and the cupola is supported by sixteen ribs, springing from the same number of columns. The frescoes are interesting works of the early 13th century. In the centre is an octagonal font bearing date 1204. The episcopal palace shows traces of the building of 1232. To the east of the cathedral, and at no great distance, stands the church of S. Giovanni Evangelista, which was founded along with the Benedictine monastery in 981, but as a building dates from 1310, and has a façade erected by Simone Moschino early in the 17th century. The interior is an extremely fine early Renaissance work. The frescoes on the cupola representing the vision of S. John are by Correggio, and the arabesques on the vault of the nave by Anselmi. The Madonna della Stecata (Our Lady of the Palace), a fine church in the form of a Greek cross, erected between 1521 and 1557 after Zacagni's designs, contains the tombs and monuments of many of the Bourbon and Farnese dukes of Parma, and preserves its pictures, Parmigianino's "Moses Breaking the Tables of the Law" and Anselmi's "Coronation of the Virgin." S. Francesco, probably the earliest Franciscan church in northern Italy (1230-1232; now a prison), is a Gothic building in brick with a fine rose-window. The Palazzo della Pilotta is a vast and irregular group of buildings dating mainly from the 16th and 17th centuries; it now comprises the academy of fine arts (1752) and its valuable picture gallery. Among the most celebrated pictures here are Correggio's "Madonna di San Girolamo" and "Madonna della Scoladella." The Teatro Farnese, a remarkable wooden structure erected in 1618-1619 by Aleotti d'Argenta's designs, and capable of containing 4500 persons, is also in this palace. There are other beautiful ceiling frescoes by Correggio in the former Benedictine nunnery of S. Paolo, executed in 1528-1531; in an adjoining chamber are fine arabesques by Allardi (d. 1528); thence come also some fine majolica tiles (1474-1483), now in the museum. The royal university of Parma, founded in 1601 by Ranuccio I., and reconstituted by Philip of Bourbon in 1768, has faculties in law, medicine and natural science, and possesses an observatory, and natural science collections, among which is the Etruscan Zoological Museum. A very considerable trade is carried on at Parma in grain, cattle and the dairy produce of the district. The grana cheese known as Parmesan is not now so well made at Parma as in some other parts of Italy—Lodi, for example.

From archaeological discoveries it would appear that the ancient town was preceded by a prehistoric settlement of the Bronze Age, the dwellings of which rested upon piles—one, indeed, of the so-called terramare, which are especially frequent in the neighbourhood of Parma. Parma became a Roman colony of 2000 colonists in 183 B.C., four years after the construction of the Via Aemilia, on which it lay. The bridge by which the Via Aemilia crossed the river Parma, from which it probably takes its name (from Pastra, the modern Postra), was probably built on the site of the present bridge of the same name. The bishop of Parma is mentioned in the acts of the council of Rome of A.D. 378. It fell into the power of Alboin in 569 and became the seat of a Lombard duchy; it was still one of the wealthiest cities of Aemilia in the Lombard period. During the 10th, 12th and 13th centuries Parma had its full share of the Guelph and Ghibelline struggles, in which it mainly took the part of the former, and also carried on repeated hostilities with Borgo San Donnino and Piacenza. Its bishop Cadalus (1046-1071) was elected to the papacy by the Lombard and German bishops in 1061, and marched on Rome, but was driven back by the partisans of Alexander III. To him is due the building of the cathedral. As a republic its government was mainly in the hands of the Ross, Pallavicino, Correggio and Sanvitale families. The fruitless siege of Parma in 1248 was the last effort of Frederick II. In the cathedral flags captured in this siege are preserved. In 1307 the city became a lordship for Ghiberto da Correggio, who laid the basis of its territorial power by conquering Reggio, Bescrollo and Gaivalla, and was made commander-in-chief of the Guelphs by Robert of Apulia. The Correggio family never managed to keep possession of it for long, and in 1346 they sold it to the Visconti (who constructed a citadel, La Rocchetta, in 1356, of which some remains exist on the east bank of the river, while the latter l'età du pont may be seen on the west bank), and from them it passed to the Sforza. Becoming subject to Pope Julius II. in 1512, Parma remained (in spite of the French occupation from 1515 to 1521) a papal possession till 1545, when Paul III. (Alexander Farnese) invested his son Pierluigi with the duchies of Parma and Piacenza. There were eight dukes of Parma of the Farnese line—Pierluigi (d. 1547), Ottavio (1560), Alessandro (1562), Ranuccio I. (1602), Odoardo (1606), Ranuccio II. (1694), Francesco (1727), Antonio (1731). Antonio and Francesco both having died childless, the duchy passed to Charles of Bourbon (Don Carlos), infante of Spain, who, becoming king of Naples in 1734, surrendered Parma and Piacenza to the Austrian territory of the Farnese dynasty which he had removed from Parma to Naples. Spain reacquired the duchies in the war of succession (1745); they were recovered by Austria in 1746; and Maria Theresa again surrendered them to Don Philip, infante of Spain, in 1748. Ferdinand, Philip's son, who succeeded under D'Urbis' regency in 1765, saw his states occupied by the revolutionary forces of France in 1796, and had to purchase his life-interest with 6,000,000 lire and 25 of the best paintings in Parma. On his death in 1802 the duchies were incorporated with the French republic and his son Louis became "king of Etruria." Parma was thus governed for several years by Moreau de Saint-Méry and by Junot. At the congress of Vienna, Parma, Piacenza and Guastalla were assigned to Marie Louise (daughter of Francis I. of Austria and Napoleon's second consort), and on her death they passed in 1847 to Charles II. (son of Louis of Etruria
and Marie Louise, daughter of Charles IV., king of Spain). The new duke, unwilling to yield to the wishes of his people for greater political liberty, was soon compelled to take flight, and the duchy was for a time ruled by a provisional government and by Charles Albert of Sardinia; but in April 1849 Baron d'Aspre with 15,000 Austrians took possession of Parma, and the ducal government was restored under Austrian protection. Charles II. (who had in 1820 married Theresa, daughter of Victor Emmanuel of Sardinia) abdicated in favour of his son Charles III., on the 14th of March, 1849. On the assassination of Charles III. in 1854, his widow, Marie Louise (daughter of Ferdinand, prince of Artois and duke of Berry), became regent for her son Robert. In 1860 his possessions were formally incorporated with the new kingdom of Italy.

The duchy of Parma in 1849 had an area of 2376 sq. m. divided into five provinces—Borgo San Donnino, Valdichiaro, Parma, Lunigiana Parmense and Piacenza. The population in 1841 was 497,343. Under Marie Louise (1810–59) the territory of Guastalla (50 sq. m.) formed part of the duchy, but it was transferred in 1847 to Modena in exchange for the communes of Bagnone, Filattiera, &c., which went to constitute the Lunigiana Parmense.

See AFO, Storia di Parma (1799-1795); Scarabelli, Storia dei duchi di Parma, Piacenza, e Guastalla (1858); Battufoco, Dizion. corog. dei duchi, &c. (1853); Mon. hist. ad provincias parmensem et plenum periferia (1855, &c.); L. Testi, Parma (Bergamo, 1065).

PARMENIDES OF ELEA (Velia) in Italy, Greek philosopher. According to Diogenes Laertius he was "in his prime" 504-500 B.C.; and would thus seem to have been born about 535 B.C. Plato indeed (Parmenides, 297 B) makes Socrates see and hear Parmenides when the latter was about sixty-five years of age, in which case he cannot have been born before 510; but in the absence of evidence that any such meeting took place this may be regarded as one of Plato's anachronisms. However this may be, Parmenides was a contemporary, probably a younger contemporary, of Heraclitus, with whom the first succession of physicists ended, while Empedocles and Anaxagoras, with whom the second succession of physicists began, were very much his juniors. Belonging, it is said, to a rich and distinguished family, Parmenides attached himself, at any rate for a time, to the aristocratic society or brotherhood which Pythagoras had established at Croton; and accordingly one part of his system, the physical part, is apparently Pythagorean. To Xenophanes, the founder of Eleaticism, Parmenides's philosophy is attributed, in any strict sense of the word his philosophy— Parmenides was, perhaps, more deeply indebted, as the theological speculations of that thinker unquestionably suggested to him the theory of Being and Not-Being, of the One and the Many, by which he sought to reconcile Ionian "monism," or rather "monism," with Italiote dualism. Tradition relates that Parmenides claimed laws for the Eleatics, who each year took an oath to observe them.

Parmenides embodied his tenets in a short poem, called Nature, of which fragments, amounting in all to about 160 lines, have been preserved in the writings of Sextus Empiricus, Simplicius and others. It is traditionally divided into three parts—the "Poem," "Truth" (라 προδ διάθαμ), and "Opinion" (라 προδ διάθαμ). In "Truth," starting from the formula that the Ent (or existent) is the Nonent (or non-existent) is not," Parmenides attempted to distinguish between the unity or universal element of nature and its variety or particularity, insisting upon the reality of its unity, which is therefore the object of knowledge, and upon the unreality of its variety, which is therefore the object, not of knowledge, but of opinion. In "Opinion," he propounded a theory of the world of seeming and its development, pointing out however that, in accordance with the principles already laid down, these cosmological speculations do not pretend to anything more than probability. In spite of the contemptuous remarks of Cicero and Plutarch about Parmenides's versification, Nature is not without literary merit. The introduction, though rugged, is forcible and picturesque; and the rest of the poem is written in a simple and effective style suitable to the subject.

Proem.—In the "Proem," the poet describes his journey from darkness to light. Born in a whirling chariot, and attended by the daughters of the sun, he reaches a temple sacred to an unnamed goddess (variously identified by the commentators with Nature, Prudence, or Athena), where the Thesmophoria are being spoken. He must learn all things, she tells him, both truth, which is god, and human opinions; for, though in human opinions there can be no "true faith," they must be studied notwithstanding for what they are worth.

Truth.—"Truth" begins with the declaration of Parmenides's principle in opposition to the principles of his predecessors. There are three ways of research, and three ways only. Of these, one is a non-existent and the non-existent and the existence of the non-existent [i.e. Thales, Anaximander and Anaximenes suppose the single element which they respectively postulate to be transformed into the various sorts of matter which they discover in the world around them, thus assuming the non-existence of that which is not the non-existent and the non-existent]. Another, pursued by "restless" persons, whose "road returns upon itself," assumes that a thing is and is not, is the same and not the same, an obvious reference, as Bernays points out in the unadvised decisions of thinkers (i.e. Parmenides, the theory of flux). These are ways of error, because they confound existence and non-existence. In contrast to them the way of truth starts from the proposition that "the Ent is, the Nonent is not." Existence is the strength of the fundamental distinction between the Ent and the Nonent, the goddess next announces certain characteristics of the former. The Ent is uncreated, for it cannot be derived from either the Ent or from the Nonent; it is imperishable, for it cannot be destroyed; it is absolute, for nothing exists to break its continuity in space; it is unchangeable [for nothing exists to break its continuity in time]; it is perfect, for there is nothing which it can want; it never was, nor will be, for it is eternal; it is everything, for it is a sphere, exactly balanced; it is identical with thought (i.e. it is the object, and the sole object, of thought as opposed to sensation, sensation being concerned with variety and change).

In the Eleatic world there is, there are, it has been thought (and Parmenides accepts the theory, which appears to be of Pythagorean origin, two primary elements—fire, which is element, time, which is continuous. Thus, thought that Parmenides regarded the universe as a series of concentric rings or spheres composed of the two primary elements and of combinations of them, the whole system being directed by an unadvised goddess established at ELEA. Parmenides, the theory of animal development. This again was followed by a psychology, which made thought (as well as sensation, which was conceived to differ from thought only in respect of its object) depend upon the cycle of day and night, the existence of the two elements and the cycle of day and night. "Such, opinion tells us, was the generation, such is the present existence, such will be the end, of those things to which men have given distinguishing names."

In this truism the "the Ent is, the Nonent is not," is, &c., &c. Parmenides held that his predecessors, the physiologists of the Ionian succession. Asking themselves—What is the material universe, they had replied respectively—It is water. It is peraβ 7η, It is air, It is fire. Thus, while their question meant, or ought to have meant, What is the single element which underlies the apparent plurality of the material world? their answers, Parmenides conceived, by attributing to the selected element various and varying qualities, reintroduced the plurality which the question sought to eliminate. If we would discover which is common to all things at all times, we must, he submitted, exclude the differences of things, whether simultaneous or successive. Hence, whereas his predecessors had conformed to what is universally existent with that which is not universally existent, he proposed to distinguish carefully between that which is universally existent and that which is
not universally existent, between \( \theta \) and \( \psi \). The fundamental

triumph is the epigrammatic assertion of this distinction.

In short, the single corporeal element of the Ionian physicists

was, to borrow a phrase from Aristotle, a permanent \( \sva \) having \( \pi \alpha \delta \eta \) which change; but they either neglected the \( \pi \alpha \delta \eta \) or con-

founded them with the \( \sva \). Parmenides sought to reduce the

variety of nature to a single material element; but he strictly
discriminated the constant \( \pi \alpha \delta \eta \) from the constant \( \sva \), and, understanding by "existence" universal, invariable, immutable

being; refused to attribute to the \( \pi \alpha \delta \eta \) anything more than the

semblance of existence.

Having thus discriminated between the permanent unity of

nature and its superficial plurality, Parmenides proceeded to the

separate investigation of the Ent and the Nonent. The universal-

ity of the Ent, he conceived, necessarily carries with it certain

characteristics. It is one; it is eternal; it is whole and continuous,

both in time and in space; it is immovable and immutable; it is

limited, but limited only by itself; it is evenly extended in
every direction, and therefore spherical. These propositions

having been reached, apart from particular experience, by

reflection upon the fundamental principle, we have in them,

Parmenides conceived, a body of information resting upon a

firm basis and entitled to be called "truth." Further, the

information thus obtained is the sum total of "truth"; for, as

"existence" in the strict sense of the word cannot be attributed to

anything besides the universal element, nothing besides the

universal element can properly be said to be "known." If

Parmenides's poem had had "Being" for its subject it would
doubtless have ended at this point. Its subject is, however,

"Nature"; and nature, besides its unity, has also the

semblance, if no more than the semblance, of plurality. Hence

the theory of the unity of nature is necessarily followed by a

theory of its seeming plurality, that is to say, of the variety

and mutation of things. The theory of plurality cannot indeed

pretend to the certainty of the theory of unity, being of necessity

untrustworthy, because it is the partial and inconstant representa-
tion of that which is partial and inconstant in nature. But, as

the material world includes, together with a real unity, the

semblance of plurality, so the theory of the material world

includes, together with the certain theory of the former, a

probable theory of the latter. "Opinion" is then no mere

excessiveness; it is the necessary sequel to "Truth."

Thus, whereas the Ionians, confounding the unity and the

plurality of the universe, had neglected plurality, and the

Pythagoreans, contenting themselves with the reduction of the

variety of nature to a duality or a series of dualities, had neglected

unity, Parmenides, taking a hint from Heraclitus, was

contenting himself with one another's deficiencies; for, as

Xenophanes in his theological system had recognized at once the

unity of God and the plurality of things, so Parmenides in his

system of nature recognized at once the rational unity of the Ent

and the phenomenal plurality of the Nonent.

The foregoing statement of Parmenides's position differs from

Zeller's account of it in two important particulars. First,

whereas it has been assumed above that Xenophanes was

theologian rather than philosopher, whence it would seem to

follow that the philosophical doctrine of unity originated, not

with him, but with Parmenides, Zeller, supposing Xenophanes

to have taught, not merely the unity of God, but also the unity

of Being, assigns to Parmenides no more than an exacter con-

ception of the doctrine of the unity of Being, the justification

of that doctrine, and the denial of the plurality and the mut-

ability of things. This view of the relations of Xenophanes

and Parmenides is not borne out by their writings; and, though

ancient authorities may be quoted in its favour, it would seem that

in this case as in others, they have fallen away into the error

of confounding successive phases of doctrine, "construct-

ing the utterances of the master in accordance with the principles

of his scholars—the vague by the more definite, the simpler by

the more finished and elaborated theory" (W. H. Thompson).

Secondly, whereas it has been argued above that "Opinion"
is

necessarily included in the system, Zeller, supposing Parmenides

to deny the Nonent even as a matter of opinion, regards that part

of the poem which has opinion for its subject as no more than a

revised and improved statement of the views of opponents,

introduced in order that the reader, having before him the false
doctrine as well as the true one, may be led the more certainly
to embrace the latter. In the judgment of the present writer,

Parmenides, while he denied the real existence of plurality,

recognized its apparent existence, and consequently, however

little value he might attach to opinion, was bound to take

account of it: "for even at the very existence of the nature," says

Renouvier, "it reste encore à faire une histoire naturelle de l'apparence et de l'illusion."

The teaching of Parmenides variously influenced both his

immediate successors and subsequent thinkers. By his recog-
nition of an apparent plurality supplementary to the real unity,

he effected the transition from the "monism" or "henism" of the

first physical speculation to the "pluralism" of the second. While

Empedocles and Democritus are careful to emphasize their

dissent from "Truth," it is obvious that "Opinion" is the basis of

their cosmologies. The doctrine of the deceitfulness of the "undiscerning eye and the echoing ear" so

soon established itself, though the grounds upon which Empedocles, Anaxagoras and

Democritus maintained it were not those which were alleged by Parmenides. Indirectly, through the dialectic of his pupil and

friend Zeno and otherwise, the doctrine of the inadequacy of

sensation led to the humanist movement, which for a time threatened to put an end to philosophical and scientific specula-
tion. But the positive influence of Parmenides's teaching was

not yet exhausted. To say that the Platonism of Plato's

later years, the Platonism of the Parmenides, the Philolaus and

the Timaeus, is the philosophy of Parmenides enlarged and

reconstituted, may perhaps seem paradoxical in the face of the

severe criticism to which Eleaticism is subjected, not only in the

Parmenides, but also in the Sophist. The criticism was, however,

preparatory to a reconstruction. Thus may be explained the

selection of an Eleatic stranger to be the chief speaker in the

latter, and of Parmenides himself to take the lead in the former.

In the Sophist criticism predominates over reconstruction, the

Zenonian logic being turned against the Parmenides metaphysic in

such a way as to show that both the one and the other need

revision: see 241 D, 244 B seq., 257 B seq., 258 D. In particular,

Plato taxes Parmenides with his inconsistency in attributing

(as he certainly did) to the fundamental unity extension and

spaciness, so that "the worshipped \( \theta \) is after all a pitiful \( \psi \)" (W. H. Thompson). In the Parmenides reconstruction pre-

dominates over criticism—the letter of Eelaticism being here

represented by the Zeno, its spirit, Plato conceives it, by Parmenides.

Not the least important part of the result obtained by this
dialogue is the discovery that, whereas the doctrine of the

"one" and the "many" is suicidal and barren so long as the

"solitary one" and the "indefinitely many" are absolutely

separated (137 C seq. and 163 B seq.), it becomes consistent and

fruitful as soon as a "definite plurality" is interpolated between

them (142 B seq., 157 B seq., 160 B seq.). In short, Parmenides

was no idealist, but Plato recognized in him, and rightly, the

precursor of idealism.

BIBLIOGRAPHY.—The fragments have been skilfully edited by

PARMENIO—PARMIGIANO

PARMENIO (c. 400–330 B.C.), Macedonian general in the service of Philip II and Alexander the Great. During the reign of Philip Parmenio obtained a great victory over the Ilyrians (356); he was one of the Macedonian delegates appointed to conclude peace with Athens (346), and was sent with an army to uphold Macedonian influence in Euboea (342). In 336 he was sent with Amyntas and Attalus to make preparations for the reduction of Asia. He led the left wing in the battles of the Granicus, Issus and Gaugamela. After the conquest of Drangiana, Alexander was informed that Philotas, son of Parmenio, was involved in a conspiracy against his life. Philotas was condemned by the army and put to death. Alexander, thinking it dangerous to allow the father to live, sent orders to Media for the assassination of Parmenio. There was no proof that Parmenio was in any way implicated in the conspiracy, but he was not even afforded the opportunity of defending himself.

If we examine some events of Parmigianino's life, we find that there was a widespread belief that he was a great master of painting. His pictures were highly praised by Vasari, who said that he had a unique talent for representing the soul's inner life. However, Parmigianino's work was not always well received. For instance, his portrait of the Madonna of the Long Neck, which was painted for the Church of S. Maria della Steccata in Rome, was criticized for its unnatural proportions.

Despite the great disaster of Rome, the life of Mazzola had hitherto been fairly prosperous—the admiration which he excited being proportionate to his charm of person and manner, and to the precocity and brilliancy (rather than depth) of his genius; but from this time forward he became an unfortunate, and it would appear a soured and self-neglected, man. In 1531 he returned to Parma, and was commissioned to execute an extensive series of frescoes in the choir of the church of S. Maria della Steccata. These were to be completed in November 1532; and half-payment, 200 golden scudi, was made to him in advance. A ceiling was allotted to him, and an arch in front of the ceiling; on the arch he painted six figures—two of them in full colour, and four in monochrome—Adam, Eve, some Virtues, and the famous figure (monochrome) of Moses about to shatter the tables of the law. But, after five or six years from the date of the contract, Parmigianino had barely made a good beginning with his stipulated work. According to Vasari, he neglected painting in favour of alchemy—he laboured over futile attempts to "congeal mercury," being in a hurry to get rich anyhow. It is rather difficult to believe that the various graphic and caustic phrases which Vasari bestows upon this theory of the facts of Mazzola's life are altogether gratuitous and wide of the mark; nevertheless the painter's principal biographer, the Padre Affò, undertook to refute Vasari's statements, and most subsequent writers have accepted Affò's conclusions. Whatever the cause, Parmigianino failed to fulfill his contract, and was imprisoned in default. Promising to amend, he was released; but instead of redeeming his pledge he decamped to Casal Maggiore, in the territory of Cremona. Here, according even to Vasari, he relinquished alchemy and resumed painting; yet he still hankered (or is said by Vasari to have hankered) after his returns and fortunes, lost all his brightness, and presented a dim, poverty-stricken, hirsute and uncivilized aspect. He died of a fever on the 24th of August 1540, before he had completed his thirty-seventh year. By his own desire he was buried naked in the church of the Servites called La Fontana, near Casal Maggiore.

Grace has always and rightly been regarded as the chief artistic endowment of Parmigianino—grace which is genuine as an expression of the painter's nature, but partakes partly of the artificial and affected in its developments. "Un po'di grazia del Parmigianino" (a little, or, as we might say, just a spice, of Parmigianino's grace) was among the ingredients which Agostino Caracci's famed sonnet desiderates for a perfect picture. Mazzola constantly made many studies of the same figure, in order to get the most graceful attainable form, movement and drapery—the "designing" point in which he was very successful. The proportions of his figures are always correct for the truth of nature—the stature, fingers and neck; one of his Madonnas, now in the Pitti Gallery, is currently named "La Madonna del collo lungo." Neither expression nor colour is a strong point in his works; the figures in his compositions are generally few—the chief exception being the picture of "Christ Preaching to the Multitude." He etched a few plates, being apparently the earliest Italian painter who was also an etcher; but the statement that he produced several woodcuts is not correct—he overlooked the production of them by other hands.

The most admired easel-picture of Parmigianino is the "Cupid Making a Bow," with two children at his feet, one crying, and the other laughing. This was painted in 1536 for Francesco Boliardi of Parma, and is now in the gallery of Vienna. There are various replicas of it, and some of these may perhaps be from Mazzola's own hand. Of his portrait-painting, two interesting examples are the likeness of Amerigo Vespucci (after whom America is named) in the Studij Gallery of Naples, and the painter's own portrait in the Uffizi of Florence. One of Parmigianino's principal pupils was his cousin, Girolamo di Michele Mazzola; probably some of the works attributed to Francesco are really by Girolamo.

See B. Bossi, Disegni originali di Francesco Mazzuoli (1792); A. S. Mortara, Della Vita di Francesco Mazzuoli (1845); Toschi, Affrechetti, &c. (1846).
PARNHYBA—PARNELL, C. S.

PARNAHYBA, or Parnariba, a port of the state of Paraíba, Brazil, on the right bank of the Parnahyba river, 250 m. below the city, Therésina. Pop. of the municipality (1890), 4415. Parnahyba is situated at the point where the most easterly of the delta outlets, or channels, called the Rio Igarassú, branches off from the main stream. All the outlet channels of the river are obstructed by bars built up by the strong current along the Atlantic coast, and only vessels of light draught can enter. The town has some well-constructed buildings of the old Portuguese type, including two churches and a fine hospital. Parnahyba is the commercial entrepôt of the state. It exports hides, goatskins, cotton and tobacco, chiefly through the small port of Amarraçao, at the mouth of the River Igarassú, 11 m. distant.

PARNASSUS (mod. Liokoura or Liberí), a mountain of Greece, 8070 ft., in the south of Phocis, rising over the town of Delphi. It had several prominent peaks, the chief known as Tithorea and Lycoreia (whence the modern name). Parnassus was one of the most holy mountains in Greece, hallowed by the worship of Apollo, of the Muses, and of the Corycian nymphs, and by the orgies of the Bacchante. Two projecting cliffs, named the Phaedriadae, frame the gorge in which the Castalian spring flows out, and just to the west of this, on a shelf above the ravine of the Pleistus, is the site of the Pythian shrine of Apollo and the Delphic oracle. The Corycian cave is on the plateau between Delphi and the summit.

PARNASSUS PLAYS, a series of three scholastic entertainments performed at St John's College, Cambridge, between 1597 and 1603. They are satirical in character and aim at setting forth the wretched state of scholars and the small respect paid to learning by the world at large, as exemplified in the adventures of two university men, Philomusus and Studio. The first part, The Pilgrimage to Parnassus, describes allegorically their four-year journey to Parnassus, i.e. their progress through the university course of logic, rhetoric, &c., and the temptations set before them by their meeting with Madido, a drunkard, Stupido, a puritan who hates learning, Amoretto, a lover, and Ingenioso, a disappointed student. The play was doubtless originally intended to stand alone, but the whole of which it was received led to the writing of a sequel, The Return from Parnassus, which deals with the adventures of the two students after the completion of their studies at the university, and shows them discovering by bitter experience of how little pecuniary value their learning is. They again meet Ingenioso, who is making a scanty living by the press, but is on the search for a patron, as well as a new character, Luxurioso. All four now leave the university for London, while a draper, a tailor and a tapster lament their unpaid bills. Philomusus and Studio find work respectively as a sexton and a tutor in a merchant's family, while Luxurioso becomes a writer and singer of ballads. In the meanwhile Ingenioso has met with a patron, a coxcomical fellow named Gullio, for whom he composes amorous verses in the style of Chaucer, Spenser and Shakespeare, the last alone being to the patron's satisfaction. Gullio is indeed a great admirer of Shakespeare, and in his conversations with Ingenioso we have some of the most interesting of the early allusions to him. A unique copy of this play, The Second Part of the Return from Parnassus, or the Scourge of Simony (1606), two editions bearing the same title have been several times reprinted. The full title of the second edition being that of Professor Arber in the "English Scholars' Library" (1879). Manuscript copies of all three plays were found among T. Hearne's papers in the Bodleian by the Rev. W. D. Macray, and published in 1886 (the last from one of the editions of 1606, collated with the MS.). A recent edition in modern spelling by Mr O. Smeaton in the "Temple Dramatists" is of little value. All questions connected with the play have been already discussed by Dr W. Uhr in a dissertation entitled Die drei cambriger Spiele von Parnass (Kiel, 1900). A more recent edition is Dr Ward's English Dramatic Literature, ii. 633-642; F. G. Fleay's Biol. Chron. of the Engl. Drama, i. 347-355.

PARNELL, CHARLES STEWART (1846-1891), Irish Nationalist leader, was born at Avondale, Co. Wicklow, on the 27th of June 1846. His father was John Henry Parnell, a country gentleman of strong Nationalist and Liberal sympathies, who married in 1834 Delia Tudor, daughter of Commodore Charles Stewart of the United States Navy. The Parnell family was of English origin, and more than one of its members attained civic note at Congleton in Cheshire under the Stuarts and during the
Commonwealth. Among them was Thomas Parnell, who migrated to Ireland after the Restoration. He had two sons. Thomas Parnell the poet and John Parnell, who became an Irish judge. From the latter Charles Stewart Parnell was lineally descended in the fifth generation. Sir John Parnell, chancellor of the exchequer in Grattan’s parliament, and one of O’Connell’s lieutenants in the parliament of the United Kingdom, was the grandson of Parnell the judge. The estate of Avondale was settled on him by a friend and bequeathed by him to his youngest son William (grandfather of Charles Stewart Parnell). His eldest son was imbecile. His second son was Sir Henry Parnell, a noted politician and financier in the early part of the 19th century, who held office under Grey and Melbourne, and after being raised to the peerage as Baron Congleton, died by his own hand in 1842. William Parnell was a keen student of Irish politics, with a strong leaning towards the popular side, and in 1834 he published a pamphlet entitled “Thoughts on the Causes of Popular Discontents,” which was favourably noticed by Sydney Smith in the Edinburgh Review. Thus by birth and ancestry, and especially by the influence of his mother, who inherited a hatred of England from her father, Charles Stewart Parnell was, as it were, dedicated to the Irish national cause. He was of English extraction, a landowner, and a Protestant. Educated at private schools in England and at Magdalen College, Cambridge, his temperament and demeanour were singularly un-Irish on the surface—reserved, cold, repellent and unemotional. He appears to have been rather turbulent as a schoolboy, contentious, insubordinate, and not over-scrupulous. He was fond of cricket and devoted to mathematics, but had little taste for other studies or other games. He was subject to somnambulism, and liable to severe fits of depression—facts which, taken in connexion with the existence of mental affliction among his ancestors, with his love of solitude and mystery, and his invincible superstitions about omens, numbers and the like, may perhaps suggest that his own mental equilibrium was not always stable. He was as little at home in an English school or an English university as he was afterwards in the House of Commons. “These English,” he said to his brother at school, “despise us because we are Irish, but we must stand up to them. That’s the way to treat an Englishman—stand up to him.”

Parnell was not an active politician in his early years. He found salvation as a Nationalist and even as a potential rebel over the execution of the “Manchester Martyrs” in 1867, but it was not until some years afterwards that he resolved to enter parliament. In the meanwhile he paid a lengthened visit to the United States. At the general election of 1874 he desired to stand for the county of Wicklow, of which he was high sheriff at the time. The lord-lieutenant declined to relieve him of his disqualifying office, and his brother John stood in his place, but was unsuccessful at the poll. Shortly afterwards a bye-election occurred in Dublin, owing to Colonel Taylor having accepted office in the Disraeli government, and Parnell resolved to oppose him as a supporter of Isaac Butt, but was heavily beaten. He had no sympathy whatever with Mr. Butt, and but for this he might have left Ireland. Butt had sparingly respected the dignity of parliament and the traditions and courtesy of debate. He looked very coldly on the method of “obstruction”—a method invented by certain members of the Conservative party in opposition to the first Gladstone Administration. Parnell, however, entered parliament as a virtual rebel who knew that physical force was of no avail, but believed that political exasperation might attain the desired results. He resolved to make obstruction in parliament do the work of outrage in the country, to set the church-bell ringing—to borrow Mr Gladstone’s metaphor—and to keep it ringing in season and out of season in the ears of the House of Commons. He did not choose to condemn outrages to gratify the Pharisaism of English members of parliament. He courted the alliance of the physical force party, and he had to pay the price for it. He invented and encouraged “boycotting,” and did not discourage outrage. When a supporter in America offered him twenty-five dollars, “five for bread and twenty for lead,” he accepted the gift, and he subsequently told the story on at least one Irish platform. In the course of the negotiations in 1882, which resulted in what was known as the Kilmahim Treaty, he wrote to Captain O’Shea: “If the arrears question be settled upon the lines indicated by us, I have every confidence that the exertions we should be able to make strenuously and unremittingly would be effective in stopping outrages and intimidation of all kinds.” This is at least an admission that he had, or could place, his hand on the stop-valve, even if it be not open to the gloss placed on it by Captain O’Shea in a conversation repeated in the House of Commons by Mr Forster, “that the conspiracy which has been used to get up boycotting and outrage will now be used to put them down.”

In 1877 Parnell entered on an organized course of obstruction. He and Mr Joseph Gillis Biggar, one of his henchmen, were gradually joined by a small band of the more advanced Home Rulers, and occasionally assisted up to a certain point by one or two English members. Butt was practically deposed and warned into his grave. William Shaw, a “transient and embattled phase of Parnellism,” was elected in his place, but Parnell became the real leader of a Nationalist party. The original Home Rule party was split in twain, and after the general election of 1880 the more moderate section of it ceased to exist. Obstruction in Parnell’s hands was no mere weapon of delay and exasperation; it was a calculated policy, the initial stage of a campaign designed to show the malcontents in Ireland and their kinsmen in other lands that Butt’s strictly constitutional methods were quite helpless, but that the parliamentary armoury still contained weapons which he could so handle as to convince the Irish people and even the Fenians and other physical force societies that the way to Irish legislative independence lay through the House of Commons. The Fenians were hard to convince, but in the autumn of 1877 Parnell persuaded the Home Rule Confederation of Great Britain (an association founded by Butt, but largely supported by Fenians) to depose Butt from its presidency and to elect himself in his place. He defined his attitude quite clearly in a speech delivered in New York early in 1880: “A true revolutionary movement in Ireland should, in my opinion, partake both of a constitutional and illegal character. It should be both an open and a secret organization, using the constitution for its own purposes, but also taking advantage of its secret combination.” Parnell’s opportunity came with the general election of 1880, which displaced the Conservative government of Lord Beaconsfield and restored Mr Gladstone to power with a majority strong enough at the outset to overpower the Opposition, even should the latter be reinforced by the whole of Parnell’s contingent. Distress was acute in Ireland, and famine was imminent. Ministers had taken measures to relieve the situation before the dissolution was announced, but Lord Beaconsfield had warned the country that there was a danger ahead in Ireland “in its ultimate results scarcely less disastrous than pestilence and famine. . . . A portion of its population is attempting to sever the constitutional tie which unites it to Great Britain in that bond which has favoured the power and prosperity of both. It is to be hoped that the light and leading will resist this destructive doctrine.” The Liberals, however, and its leaders retorted that they were as strongly opposed to Home Rule as their opponents, but Lord Beaconsfield’s manifesto undoubtedly had the effect of alienating the Irish vote in the English constituencies from the Tory party and throwing it on the side of the Liberal candidates. This was Parnell’s deliberate policy. He would have no alliance with either English party. He would support each in turn with a sole regard to the balance of political power in parliament and a fixed determination to hold it in his own hands if he could. From the time that he became its leader the Home Rule party sat together in the House of Commons and always on the Opposition side.

In the government formed by Mr Gladstone in 1880 Lord Cowper became viceroy and Mr W. E. Forster chief secretary for Ireland. The outlook was gloomy enough, but the Gladstone government do not seem to have anticipated, as Peel anticipated in 1841, that Ireland would be their difficulty. Yet the Land League had been formed by Michael Davitt and others in the
PARNELL, C. S.

autumn of 1879 for the purpose of agrarian agitation, and Parnell after some hesitation had given it his sanction. He visited the United States at the close of 1879. It was then and there that the "new departure"—the alliance of the open and secret organizations—was confirmed and consolidated. Parnell obtained the countenance and support of the Clan-na-Gael, a revolutionary organization of the American-Irish, and the Land League began to absorb all the more violent spirits in Ireland, though the Fenian brotherhood still held officially aloof from it. As soon as the general election was announced Parnell returned to Ireland in order to direct the campaign in person. Though he had supported the Liberals at the election, he soon found himself in conflict with a government which could neither tolerate disturbance nor countenance a Nationalist agitation, and he entered on the struggle with forces organized, with money in his chest, and with a definite but still undeveloped plan of action. The prevailing distress increased and outrages began to multiply. A fresh Relief Bill was introduced by the government, and in order to stave off a measure to prevent evictions introduced by the Irish party, Mr. Forster consented to add a clause to the Relief Bill for giving compensation in certain circumstances to tenants evicted for non-payment of rent. This clause was afterwards embodied in a separate measure known as the Compensation for Disturbance Bill, which after a stormy career in the House of Commons was summarily rejected by the House of Lords.

The whole Irish question was once more opened up in its more dangerous and more exasperating form. It became clear that the land question—supposed to have been settled by Mr. Gladstone's Act of 1870—would have to be reconsidered in all its bearings, and a commission was appointed for the purpose. In Ireland things went from bad to worse. Evictions increased and outrages were multiplied. Intimidations and boycotting were rampant. As the winter wore on, Mr. Forster persuaded his colleagues that exceptional measures were needed. An abortive prosecution of Parnell and some of his leading colleagues had by this time intensified the situation. Parliament was summoned early, and a Coercion Bill for one year, practically suspending the Habeas Corpus Act and allowing the arrest of suspects at the discretion of the government, was introduced, to be followed shortly by an Arms Bill. Parnell regarded the measure as a declaration of war, and met it in that spirit. Its discussion was doggedly obstructed at every stage, and on one occasion the debate was only brought to a close, after lasting for forty-one hours, by the Speaker's claiming to interpret the general sense of the house and resolving to put the question without further discussion. The rules of procedure were then amended afresh in a hasty and intricate sense, and as soon as the bill was passed Mr. Gladstone introduced a new Land Bill, which occupied the greater part of the session. Parnell accepted it with many reserves. He could not ignore its concessions, and was not disposed to undervalue them, but he had to make it clear to the revolutionary party, whose support was indispensable, that he regarded it only as a payment on account, even from the agrarian point of view, and no payment at all from the national point of view. Accordingly the Land League at his instigation determined to "test" the act by advising tenants in general to refrain from taking their cases into court until certain cases selected by the Land League had been decided. The government treated this policy, which was certainly not designed to make the act work freely and beneficially, as a deliberate attempt to intercept its benefits and to keep the Irish people in subjection to the Land League; and this was the more so as Lord Gladstone and Mr. Forster had both expressed the wish that the Land League and its leaders towards crime and outrage—Parnell was arrested under the Coercion Act and lodged in Kilmainham gaol (October 17, 1881).

Parnell in prison at once became more powerful for evil than he had ever been, either for good or for evil, outside. He may have known that the policy of Mr. Forster was little favoured by several of his colleagues, and he probably calculated that the detention of large numbers of suspects without cause assigned and without trial would sooner or later create opposition in

England. Mr. Forster had assured his colleagues and the House of Commons that the power of arbitrary arrest would enable the police to lay their hands on the chief agents of disturbance, and it was Parnell's policy to show that so long as the grievances of the Irish tenants remained unredressed no number of arrests could either check the tide of outrage or restore the country to tranquility. Several of his leading colleagues followed him into captivity at Kilmainham, and the Land League was dissolved, its treasurer, Patrick Egan, escaping to Paris and carrying with him its books and accounts. Before it was formally suppressed the League had issued a manifesto, signed by Parnell and several of his fellow-prisoners, calling upon the tenants to pay no rents until the government had restored the constitutional rights of the people. Discouraged by the priests, the No-Rent manifesto had little effect, but it embittered the struggle and exasperated the temper of the people on both sides of the Irish Channel.

Lord Cowper and Mr. Forster were compelled to ask for a renewal of the Coercion Act with enlarged powers. But there were members of the cabinet who had only accepted it with reluctance, and were now convinced not only that it had failed, but that it could never succeed. A modus vivendi was desired on both sides. Negotiations were set on foot through the agency of Captain O'Shea—at that time and for long afterwards a firm political and personal friend of Parnell, but ultimately his accuser in the divorce court—and after a somewhat intricate course they resulted in what was known as the Kilmainham Treaty. As a consequence of this informal agreement, Parnell and two of his friends were to be released at once, the understanding being, as Mr. Gladstone stated in a letter to Lord Cowper, "that Parnell and his friends are ready to abandon 'No Rent' formally, and to declare against outrage energetically, intimidation included, in and if the government announce a satisfactory plan for dealing with arrests." Parnell's own version of the understanding has been quoted above. It also included a hope that the government would allow the Coercion Act to lapse and govern the country by the same laws as in England. Parnell and his friends were released, and Lord Cowper and Mr. Forster at once resigned.

The Phoenix Park murders (May 6, 1882) followed (see Ireland: History). Parnell was prostrated by this catastrophe. In a public manifesto to the Irish people he declared that "no act has ever been perpetrated in our country, during the exciting struggle for social and political rights of the past fifty years, that has so stained the name of hospitable Ireland as this cowardly and unprovoked assassination of a friendly stranger." Privately to his own friends and to Mr. Gladstone he expressed his desire to withdraw from public life. There were those who believed that nevertheless he was privy to the Invincible conspiracy. There is some prima facie foundation for this belief in the indifference he had always displayed towards crime and outrage when crime and outrage could be made to serve his purpose; in his equivocal relation to the more violent and unscrupulous forms of Irish sedition, and in the fact that Byrne, an official of the Land League, was in collusion with the Invincibles, that the knives with which the murder was done had been concealed at the offices of the Land League in London, and had been conveyed to Dublin by Byrne's wife. But the maxim is fecit cui prodest disallows these suspicions. Parnell gained nothing by the murders, and seemed for a time to have lost everything. A new Crimes Bill was introduced and made operative for a period of three years. A régime of renewed coercion was maintained by Lord Spencer and Mr. (afterwards Sir George) Trevelyan, who had succeeded Mr. Gladstone in the office of chief secretary; Ireland was tortured for three years by the necessary severity of its administration, and England was exasperated by a succession of dynamite outrages organized chiefly in America, which Parnell was powerless to prevent. The Phoenix Park murders did more than any other incident of his time and career to frustrate Parnell's policy and render Home Rule impossible.

For more than two years after the Phoenix Park murders Parnell's influence in parliament, and even in Ireland, was only intermittently and not very energetically exerted. His
health was indifferent, his absences from the House of Commons were frequent and mysterious, and he had already formed those relations with Mrs O’Shea which were ultimately to bring him to the divorce court. The Phoenix Park murderers were arrested and brought to justice early in 1884. Mr Forster seized the opportunity to deliver a scathing indictment of Parnell in the House of Commons. In an almost contemptuous reply Parnell repudiated the charges in general terms, disavowed all sympathy with dynamite outrages, their authors and abettors—the only occasion on which he ever did so—declined to plead in detail before an English tribunal, and declared that he sought only the approbation of the Irish people. This last was shortly afterwards manifested in the form of a subscription known as the “Parnell Tribute,” which quickly reached the amount of £37,000, and was presented to Parnell, partly for the liquidation of debts he was known to have contracted, but mainly in recognition of his public services. The Irish National League, a successor to the suppressed Land League, was founded in the autumn of 1882 at a meeting over which Parnell presided, but he looked on it at first with little favour, and its action was largely paralysed by the operation of the Crimes Act and the vigorous administration of Lord Spencer.

The Crimes Act, passed in 1882, was to expire in 1885, but the government of Mr Gladstone was in no position to renew it as it stood. In May notice was given for its partial renewal, subject to changes more of form than of substance. The second reading was fixed for the 10th of June. On the 8th of June Parnell, with thirty-nine of his followers, voted with the Opposition against the budget, and defeated the government by a majority of 204 votes to 252. Mr Gladstone forthwith resigned. Lord Salisbury undertook to form a government, and Lord Carnarvon became viceroy. The session was rapidly brought to an end with a view to the dissolution rendered necessary by the Franchise Act passed in 1885—a measure which was certain to increase the number of Parnell’s adherents in parliament. It seems probable that Parnell had convinced himself before he resolved to join forces with the Opposition that a Conservative government would not renew the Crimes Act. At any rate, no attempt to renew it was made by the new government. Moreover, Lord Carnarvon, the new viceroy, was known to Parnell and to some others among the Irish leaders to be not unfavourable to some form of Home Rule if due regard were paid to imperial unity and security. He sought and obtained a personal interview with Parnell, explicitly declared that he was speaking for himself alone, heard Parnell’s views, expounded his own, and forthwith with reported what had taken place to the Prime Minister. In the result the new cabinet refused to move in the direction apparently desired by Parnell. Carnarvon opened the electoral campaign with a speech in Dublin, in which he pronounced unequivocally in favour of self-government for Ireland, and expressed his confident hope “that it may not be necessary for us in the new parliament to devote our attention to subsidiary measures, and that it may be possible for us to have a programme and a platform with only one plank, and that one plank National Independence.” This was startling to English ears. The press denounced Parnell; Lord Hartington (afterwards the duke of Devonshire) protested against so fatal and mischievous a programme; Mr Chamberlain repudiated it with even greater emphasis. Meanwhile Mr Gladstone was slowly convincing himself that the passing of the Franchise Act had made it the duty of English statesmen and English party leaders to give a respectful hearing to the Irish National demand, and to consider how far it could be satisfied subject to the government’s principle of “maintaining the supremacy of the crown, the unity of the Empire, and all the authority of parliament necessary for the conservation of the unity.” This was the position he took up in the Hawnaden manifesto issued in September before the general election of 1885. Speaking later at Newport in October, Lord Salisbury treated the Irish leader with un wonted deference and respect. Parnell, however, took no notice of the Newport speech, and waited for Mr Gladstone to declare himself more fully in Midlothian. But in this he was disappointed.

Mr Gladstone went no farther than he had done at Hawarden, and he implored the electorate to give him a majority independent of the Irish vote. Subsequently Parnell invited him in a public speech to declare his policy and to sketch the constitution he would give to Ireland subject to the limitations he had insisted on. To this Mr Gladstone replied, “through the same confidential channel,” that he could not consider the Irish demand before it had been constitutionally formulated, and that, not being in an official position, he could not usurp the functions of a government. The reply to this was the issue of a manifesto to the Irish electors of Great Britain violently denouncing the Liberal party and directing all Irish Nationalists to give their votes to the Tories. In these circumstances the general election was fought, and resulted in the return of 355 Liberals, four of whom were classed as “independent,” 249 Conservatives and 86 followers of Parnell.

Mr Gladstone had now ascertained the strength of the Irish demand, but was left absolutely dependent on the votes of those who represented it. Through Mr Arthur Balfour he made informal overtures to Lord Salisbury proffering his own support in case the Prime Minister should be disposed to consider the Irish demand in a “just and liberal spirit”; but he received no encouragement. Towards the close of the year it became known through various channels that he himself was considering the matter and had advanced as far as accepting the principle of an Irish parliament in Dublin for the transaction of Irish affairs. Before the end of January Lord Salisbury’s government was defeated on the Address, the Opposition including the full strength of the Irish party. Mr Gladstone once more became prime minister, with Mr John Morley (an old Home Ruler) as chief secretary, and Mr Chamberlain provisionally included in the cabinet. Lord Hartington, Mr Bright and some other Liberal chiefs, however, declined to join him.

Mr Gladstone’s return to power at the head of an administration conditionally committed to Home Rule marks the culminating point of Parnell’s influence on English politics and English parties. And after the defeat of the Home Rule ministry in 1886, Parnell was naturally associated closely with the Liberal Opposition. At the same time he withdrew himself largely from active interposition in current parliamentary affairs, and relaxed his control over the action and policy of his followers in Ireland. He entered occasionally into London society—where in certain quarters he was now a welcome guest—but in general he lived apart, often concealing his whereabouts and giving no address but the House of Commons, answering no letters, and seldom fulfilling engagements. He seems to have thought that Home Rule being now in the keeping of an English party, it was time to show that he had in him the qualities of a statesman, as well as those of a revolutionary and a rebel. His influence in the remedial legislation proposed by the Unionist government for Ireland was considerable, and he seldom missed an opportunity of making it felt. It more than once happened to him to find measures, which had been contemptuously rejected when he had proposed them, ultimately adopted by the government; and it may be that the comparative tranquillity which Ireland enjoyed at the close of the 19th century was due as much to legislation inspired and recommended by himself as to the disintegration of his following which ensued upon his appearance in the divorce court and long survived his death. No sooner was Lord Salisbury’s new government installed in office in 1886, than Parnell introduced a comprehensive Tenants’ Relief Bill. The government would have none of it, and in the following session they adopted and carried many of its leading provisions. Its rejection was followed by renewed agitation in Ireland, in which Parnell took no part. He was ill—"dangerously ill," he said himself at the time—and some of his more hot-headed followers devised the famous “Plan of Campaign,” on which he was never consulted and which never had his approval. Ireland was once more thrown into a turmoil of agitation, turbulence and crime, and the Unionist government, which had hoped to be able to govern the country by means of the ordinary law, was compelled to resort to severe repressive
PARNELL, C. S.

measures and fresh coercive legislation. Mr Ballour became chief secretary, and early in the session of 1887 the new measure was introduced and carried. Parnell took no very prominent part in resisting it. In the course of the spring The Times had begun publishing a series of articles entitled "Parnellism and Crime," on lines following Mr Forster's indictment of Parnell in 1883, though with much greater detail of circumstance and accusation. Some of the charges were undoubtedly well founed, some were exaggerated, some were merely the colourable fictions of political prepossession, pronounced to be not proven by the special commission which ultimately inquired into them. One of the articles, which appeared on the 18th of April, was accompanied by the facsimile of a letter purporting to be signed but not written by Parnell, in which he apologized for his attitude on the Phoenix Park murders, and specially excused the murder of Mr Burke. On the same evening, in the House of Commons, Parnell declared the letter to be a forgery, and denied that he had ever written any letter to that effect. He was not believed, and the second reading of the Crimes Act followed. Later in the session the attention of the house was again called to the subject, and it was invited by Sir Charles Lewis, an Ulster member and a bitter antagonist of the Nationalists, to declare the Times a breach of privilege. The government met this proposal by an offer to pay the expenses of a libel action against The Times to be brought on behalf of the Irish members incriminated. This offer was refused. Mr Gladstone then proposed that a select committee should inquire into the charges, including the letter attributed to Parnell, and to this Parnell assented. But the government rejected the proposal. For the rest, Parnell continued to maintain for the most part an attitude of moderation, reserve and retreat, though he more than once came forward to protest against the harshness of the Irish administration and to plead for further remedial legislation. In July 1888 he announced that Mr Cecil Rhodes had sent him a sum of £10,000 in support of the Home Rule movement, subject to the condition that the Irish representation should be retained in the House of Commons in any future measure dealing with the question. About the same time the question of "Parnellism and Crime" again became acute. Mr F. H. O'Donnell, an ex-M.P. and former member of the Irish party, brought an action against The Times for libel. His case was a weak one, and a verdict was obtained by the defendants. But in the course of the proceedings the attorney-general, counsel for The Times, affirmed the readiness of his clients to establish all the charges advanced, including the genuineness of the letter which Parnell had declared to be a forgery. Parnell once more invited the House of Commons to refer this particular issue—that of the letter—to a select committee. This was again refused; but after some hesitation the government resolved to appoint by act of parliament a special commission, composed of three judges of the High Court, to inquire into all the charges advanced by The Times. This led to what was in substance, though not perhaps in judicial form, the most remarkable state trial of the 19th century. The commission began to sit in September 1888, and issued its report in February 1890. It heard evidence of immense volume and variety, and the speech of Sir Charles Russell in defence was afterwards published in a bulky volume. Parnell gave evidence at great length, with much composure and some cynicism. On the whole he produced a not unfavourable impression, though some of his statements might seem to justify Mr Gladstone's opinion that he was not a man of exact veracity. The report of the commission was a very voluminous document, and was very variously interpreted by different parties to the controversy. Their conclusions may be left to speak for themselves:

I. We find that the respondent members of parliament collectively were not members of a conspiracy having for its object to establish the absolute independence of Ireland, but we find that some of them, together with Mr Davitt, established and joined in the Land League organization with the intention, by its means, to bring about the absolute independence of Ireland as a separate nation.

II. We find that the respondents did enter into a conspiracy, by a system of coercion and intimidation, to promote an agrarian agitation against the payment of agricultural rents, for the purpose of impoverishing and expelling from the country the Irish landlords, who were styled the 'English garrison.'

I find that the respondents did disseminate the Irish World and other newspapers tending to incite to sedition and the commission of other crime.

VI. We find, as to the allegation that the respondents did nothing to prevent crime, and expressed no bona fide disapproval, that some of the respondents, and in particular Mr Davitt, did express bona fide disapproval of crime and outrage, but that the respondents did not denounce the system of intimidation that led to crime and outrage, but persisted in it with knowledge of its effects.

VII. We find that the respondents did promise payments to compensate persons who had been injured in the commission of crime, that they did make such payments. As to the allegation that the respondents invited the assistance and co-operation of, and accepted subscriptions from, known advocates of crime and the use of dynamite, we find that the respondents did invite the assistance and co-operation of, and accept subscriptions from, known advocates of crime and the use of dynamite; but that it has not been proved that the respondents, or any of them, knew that the Clan-na-Gael controlled the League, or was collecting money for the Parliamentary Fund. It has been proved that the respondents invited and obtained the assistance and co-operation of the French Police Party in America, including the Clan-na-Gael, and in order to obtain that assistance abstained from repudiating or condemning the action of that party."

The specific charges brought against Parnell personally were thus dealt with by the commissioners:

(a) That at the time of the Kilmainham negotiations Mr Parnell knew that Sheridan and Boyton had been organizing outrage, and therefore wished to use them to put down outrage.

(b) That Mr Parnell was intimate with the leading Invincibles; that he probably learned from them what they were about when he was released on parole in April 1882; and that he recognized the Phoenix Park murderers as their handiwork.

(c) That Mr Parnell on 23rd January 1883, by an opportunre remittance, enabled F. Byrne to escape to justice in France.

"We find that Mr Parnell did not make any remittance to enable F. Byrne to escape from justice.

The case of the facsimile letter alleged to have been written by Parnell broke down altogether. It was proved to be a forgery. It had been purchased with other documents from one Richard Pigott, a needy and disreputable Irish journalist, who afterwards tried to blackmail Archbishop Walsh by offering, in a letter which was produced in court, to confess its forgery. Mercilessly cross-examined by Sir Charles Russell on this letter to the archbishop, Pigott broke down utterly. Before the commission sat again he fled to Madrid, and there blew his brains out. He had confessed the forgery to Mr Labouchere in the presence of Mr G. A. Sala, but did not stay to be cross-examined on his confession. The attorney-general withdrew the letter on behalf of The Times, and the commission pronounced it to be a forgery. Shortly after the letter had been withdrawn, Parnell filed an action against The Times for libel, claiming damages to the
amount of £100,000. The action was compromised without going into court by a payment of £5,000.

Practically, the damaging effect of some of the findings of the commission was neutralized by Parnell's triumphant vindication in the matter of the facsimile letter and of the darker charges levelled at him. Parties remained of the same opinion as before: the Unionists still holding that Parnell was steeped to the lips in treason, if not in crime; while the Home Rulers made abundance of capital out of his personal vindication, and sought to excuse the incriminating findings of the commission by the historic antecedents of the Nationalist cause and party. The failure to produce the books and papers of the Land League was overlooked, and little importance was attached by partisans to the fact that in spite of this default (leaving unexplained the manner in which over £100,000 had been expended), the commissioners "found that the respondents did make payments to compensate persons who had been injured in the commission of crime." Parnell and his colleagues were accepted as all worthy of the confidence of an English party; they were made much of in Gladstonian Liberal society; and towards the close of 1889, before the commission had reported, but some months after the forged letter had been withdrawn, Parnell visited Hawarden to confer with Mr Gladstone on the measure of Home Rule to be introduced by the latter should he again be restored to power. What occurred at this conference was afterwards disclosed by Parnell, but Mr Gladstone vehemently denied the accuracy of his statements on the subject.

But Parnell's fall was at hand. In December 1889 Captain O'Shea filed a petition for divorce on the ground of his wife's adultery with Parnell. Parnell's intimacy with Mrs O'Shea had begun in 1881, though at what date it became a guilty one is not in evidence. Captain O'Shea had in that year challenged him to a duel, but was pacified by the explanations of Mrs O'Shea. It is known that Captain O'Shea had been Parnell's confidential agent in the negotiation of the Kilmarnock Treaty, and in 1885 Parnell had strained his personal authority to the utmost to secure Captain O'Shea's return for Galway, and had quelled a formidable revolt among some of his most influential followers in doing so. It is not known why Captain O'Shea, who, if not blind to a matter of notoriety, must have been complaisant in 1885, became vindictive in 1889. No defence being offered, a decree of divorce was pronounced, and in June 1891 Parnell and Mrs O'Shea were married.

At first the Irish party determined to stand by Parnell. The decree was pronounced on the 17th of November 1890. On the 20th a great meeting of his political friends and supporters was held in Dublin, and a resolution that in all political matters Parnell should be supported to the last was passed. In the meantime the confidence of the Irish nation was carried by his colleagues in England. The "Nonconformist conscience," which had swallowed the report of the commission, was shaken by the decree of the divorce court. At a meeting of the National Liberal Federation held at Sheffield on the 21st of November, Mr John Morley was privately but firmly given to understand that the Nonconformists would insist on Parnell's resignation. Parliament was to meet on the 25th. Mr Gladstone tried to convey to Parnell privately his conviction that unless Parnell retired the cause of Home Rule was lost. But the message never reached Parnell. Mr Gladstone then requested Mr John Morley to see Parnell; but he could not be found. Finally, on the 24th, Mr Gladstone wrote to Mr Morley the famous and fatal letter, in which he declared his conviction that, notwithstanding the splendor of the position offered by Mr Parnell to his country, his continuance at the present moment in the leadership would be disastrous in the highest degree to the cause of Ireland," and that "the continuance I speak of would not only place many hearty and effective friends of the Irish cause in a position of great embarrassment, but would render my retention of the leadership of the Liberal party, based as it has been mainly upon the presentation of the Irish cause, almost a nullity." This letter was not published until after the Irish parliamentary party had met in the House of Commons and re-elected Parnell as its chairman without a dissentient voice. But its publication was a thunderclap. A few days later Parnell was requested by a majority of the party to convene a fresh meeting. It took place in Committee Room No. 15, which became historic by the occasion, and after several days of angry recrimination and passionate discussion, during which Parnell, who occupied the chair, scornfully refused to put to the vote a resolution for his own deposition, 45 members retired to another room and there declared his leadership at an end. The remainder, 26 in number, stood by him. The party was thus divided into Parnellites and anti-Parnellites, and the schism was not healed until several years after Parnell's death.

This was practically the end of Parnell's political career in England. The scene of operations was transferred to Ireland, and there Parnell fought incessantly a bitter and a losing fight, which ended only with his death. He declared that Ireland could never achieve her emancipation by force, and that if she would have to have a constitution, it should be achieved by constitutional methods, it could only be through the agency of a united Nationalist party rigidly eschewing alliance with any English party. This was the policy he proclaimed in a manifesto issued before the opening of the sitting of Committee Room No. 15, and with this policy, when deserted by the bulk of his former followers, he appealed to the Fenians in Ireland—"the hillside men," as Mr Davitt, who had abandoned him early in the crisis, contemptuously called them. The Fenians rallied to his side, giving him their votes and their support, but they were no match for the Church, which had declared against him. An attempt at reconciliation was made in the spring, at what was known as "the Boulogne negotiations," where Mr William O'Brien endeavoured to arrange an understanding; but it came to nothing in the end. Probably Parnell was never very anxious for its success. He seems to have regarded the situation as fatally compromised by the extent to which his former followers were committed to an English alliance, and he probably saw that the only way to recover his lost position was to build up a new independent party. He knew well enough that this would take time—five years was the shortest period he allowed himself—but before many months were passed he was dead. The life he led, the agonies he endured, the labours he undertook from the beginning of 1891, travelling weekly to Ireland and intoxicating himself with the atmosphere of passionate nationalism in which he moved, would have broken down a much stronger man. He who had been the most impassive of men became restless, nervous, almost distracted at times, unwilling to be alone, strange in his ways and demeanour. He visited Ireland for the last time in September, and the last public meeting he attended was on the 27th of that month. The next day he sent for his friend Dr Kenny, who found him suffering from acute rheumatism and general debility. He left Ireland on the 29th, promising to return on the following Saturday week. He did return on that day, but it was in his coffin. He took to his bed shortly after his return to his home at Brighton, and on the 6th of October he died. His remains were conveyed to Dublin, and on Sunday, the 11th of October, they were laid to rest in the presence of a vast assemblage of the Irish people in Glasnevin Cemetery, not far from the grave of O'Connell.

The principal materials for a biography of Parnell and the history of the Parnellite movement are to be found in Hansard's Parliamentary Debates (1875-1904); in the Annual Register for the same period; in the Report of the Special Commission issued in 1890; in The Life of Charles Stewart Parnell, by R. Barry O'Brien; in The Parnellite Movement, by T. P. O'Connor, M.P.; and in a copious biography of Parnell contributed by an anonymous but well-informed writer to the D.N.A. of England, vol. xiii. (J. R. T.)

PARNELL, THOMAS (1879-1718), English poet, was born in Dublin in 1679. His father, Thomas Parnell, belonged to a family (see above) which had been long settled at Congleton, Cheshire, but being a partisan of the Commonwealth, he removed with his children to Ireland after the Restoration, and purchased an estate in Tipperary which descended to his son. In 1693 the son entered Trinity College, Cambridge, and in 1700 took his
PARNON—PAROS

M.A. degree, being ordained deacon in the same year in spite of his youth. In 1704 he became minor canon of St Patrick's Cathedral and in 1706 archdeacon of Chester. Shortly after receiving this promotion he married Anne Minchin, to whom he was sincerely attached. Swift says that nearly a year after her death (1711) he was still ill with grief. His visits to London are said to have begun as early as 1706. He was intimate with Richard Steele and Joseph Addison, and although in 1711 he abandoned his Whig politics, there was no change in the friendship. Parnell was introduced to Lord Bolingbroke in 1712 by Swift, and subsequently to the earl of Oxford. In 1713 he contributed to the Poetical Miscellanea edited for Tonson by Steele, and published his essay on the Different Styles of Poetry. He was a member of the Scriblerus Club, and Pope says that he had a hand in "An Essay of the learned Martinus Scriblerus concerning the Origin of Sciences." He wrote the "Essay on the Life and writings and learning of Homer," prefixed to Pope's translations, and in the autumn of 1714 both were at Bath together. In 1716 Parnell was presented to the vicarage of Finglass, when he resigned his archdeaconry. In the same year he published Homer's Battle of the Frogs and Mice. With the remarks of Zeilus. To which is prefixed, the Life of the said Zeilus. Parnell was in London again in 1718, and, on the way back to Ireland, was taken ill and died at Chester, where he was buried on the 24th of October.

Parnell's best known poem is "The Hermit," an admirably executed moral conte written in the heroic couplet. It is based on an old story to be found in the Gesta Romanorum and other sources. He could not, in any sense be said to have been a disciple of Pope, though his verse may owe something to his friend's revision. But this and other of his pieces, "The Hymn to Contentment," "The Night Piece on Death," "The Fairy Tale," were original in treatment, and exercised some influence on the work of Goldsmith, Gray and Collins. Pope's selection of his poems was justly reprinted in 1738 as Poems of Thomas Parnell, containing Poems Moral and Divine, and on various other subjects, in which no way added to his fame. They were contemptuously dismissed as unauthentic by Thomas Gray and Samuel Johnson, but there seems no reason to doubt the authorship.

In 1770 Poems on Several Occasions was printed with a life of the author by Oliver Goldsmith. His Poetical Works were printed in Anderson's and other collections of the British Poets. See The Poetical Works (1894) edited by George A. Atken for the Aldine Editions. The first edition by the rev. John Mitford for the same series (1833) was reprinted in 1866. His correspondence with Pope is published in Pope's Works (ed. Elwin and Courthorpe, v. 451-467).

PARNON (mod. Malevo), the mountain ridge on the east of the Lacconian plain. Height 6365 ft. It is visible from Athens above the top of the Argive mountains.

PARNY, ÉVARISTE DÉSIRÉ DE FORGES, VICOMTE DE (1753-1814), was born in the Isle of Bourbon on the 6th of February 1753. He was sent to France at nine years old, was educated at Rennes, and in 1771 entered the army. He was, however, dismissed from it in 1777, and, having attached himself in love with a young lady whom he addresses as Éléonore. Her father refused to consent to her marriage with Parny, and she married some one else. Parny returned to France, and published his Poésies érotiques in 1778. He also published about the same time his Voyage de Bourgogne (1777), written in collaboration with his friend Antoine de Berton (1725-1790); Épitre aux insurgents de Boston (1777), and Opuscules poétiques (1779).

In 1796 appeared the Guerre des dieux, a poem in the style of Voltaire's Pucelle, directed against Christianity. Parny devoted himself in his later years almost entirely to the religious and political burlesque. He was elected to the Academy in 1803, and in 1813 received a pension from Napoleon. In 1805 he produced an extraordinary allegoric poem attacking George III. 1 Pope acknowledged the essay with affectionate praise, but in 1729 he said it was written "upon such memoirs as I had collected," and later he complained of its defects, saying it had cost him more pains to revise than it would have done to write it.

his family and his subjects, under the eccentric title of "Goddam! Goddam! par un French dog." Parny's early love poems and elegies, however, show a remarkable grace and ease, a good deal of tenderness, and considerable fancy and wit. One famous piece, the Elegy on a Young Girl, is scarcely to be excelled in its kind. Parny died in 1814.

His Œuvres choisies were published in 1827. There is a sketch of Parny in Sainte-Beuve's Portraits contemporains.

PARODY (Gr. παρόδος, literally a song sung beside, a comic parallel), an imitation of the form or style of a serious writing in matter of a meaner kind so as to produce a ludicrous effect. Parody is almost as old in European literature as serious writing. The Batrachomyomachia, or "Battle of the Frogs and Mice," a travesty of the heroic epos, was ascribed at one time to Homer himself; and it is probably at least as old as the 5th century B.C. The great tragic poetry of Greece very soon provoked the parody. Aristophanes parodied the style of Euripides in the Acharnians with a comic power that has never been surpassed. The debased grand style of medieval romance was parodied in Don Quixote. Shakespeare parodied the extravagant heroics of an earlier stage, and was himself parodied by Marston, incidentally in his plays and elaborately in a roughly humorous burlesque of Venus and Adonis. The most celebrated parody of the Restoration was Buckingham's Rehearsal (1672), in which the tragedies of Dryden were inimitably ridiculed. At the beginning of the 18th century The Splendid Shilling of John Philips (1706-1709), which Addison said was "the finest burlesque poem in the English language," brilliantly introduced a fashion for using the solemn movement of Milton's blank verse to celebrate ridiculous incidents. In 1736, Isaac Hawkins Browne (1705-1760) published a volume, A Pipe of Tobacco, in which the poetical styles of Colley Cibber, Ambrose Philips, James Thomson, Edward Young and Jonathan Swift were delightfully reproduced. In the following century, Shelley and John Hamilton Reynolds produced crude and feeble imitations of the naïveté and baldness of Wordsworth's Peter Bell (1819). But in that generation the most celebrated parodists were the brothers Smith, whose Rejected Addresses may be regarded as classic in this kind of artificial production. The Victorian age has produced a plentiful crop of parodists in prose and in verse, in dramatic poetry and in lyric poetry. By common consent, the most subtle and dexterous of these was C. S. Calverley, who succeeded in reproducing not merely tricks of phrase and metre, but even manneristic turns of thought. In a later day, Mr Owen Seaman has repeated; and sometimes surpassed, the agile feats of Calverley.

PAROLE (shortened from the Fr. parole d'honneur, word of honour), a military term signifying the engagement given by a prisoner of war that if released he will not again take arms against his captors during the term of the engagement or the war, unless previously relieved of the obligation by exchange. "Parole" is also used in the same sense as "word" to imply a watchword or password. The French word, formed from the Late Lat. parawa, paraba, Gr. παραβολη, story, parable, was also adopted into English as "parol," i.e. verbal, oral, by word of mouth, now only used in the legal term "parol evidence," i.e. oral as opposed to documentary evidence.

PAROPAMISUS, the name given by the Greeks to the parts of the Hindu Kush bordering Kohistan to the north-west of Kabul. It is now applied in a restricted sense to the water-parting between Herat and the Russian frontier on the Kusur river, which possesses no local name of its own. From Herat city to the crest of the Paropamisus, which is crossed by several easy passes, is a distance of about 36 m., involving a rise of 1000 ft.

PAROS, or Paro, an island in the Aegean Sea, one of the largest of the group of the Cyclades, with a population of 8000. It lies to the west of Naxos, from which it is separated by a channel about 6 m. broad, and with which it is now grouped together, in popular language, under the common name of Paronaxia. It is in 37° N. lat. and 25° 10' E. long. Its greatest length from N.E. to SW. is 15 m., and its greatest breadth
PAROXYSM—PARR, CATHERINE

10 m. It is formed on a single mountain about 2500 ft. high, sloping evenly down on all sides to a maritime plain, which is broadest on the north-east and south-west sides. The island is composed of marble, though gneiss and mica-schist are to be found in a few places. The capital, Paroikia or Parikia (Italian, Parechia), situated on a bay on the north-west side of the island, occupies the site of the ancient capital Paros. Its harbour admits small vessels; the entrance is dangerous on account of rocks. Houses built in the Italian style with terraced roofs, shadowed by luxuriant vines, and surrounded by gardens of oranges and pomegranates, give to the town a picturesque and pleasing aspect. Here on a rock beside the sea are the remains of a medieval castle built almost entirely of ancient marble remains. Similar traces of antiquity in the shape of bas-reliefs, inscriptions, columns, &c., are numerous in the town, and on a terrace to the south of it is a precinct of Asclepius. Outside the town is the church of Katapoliani ('H Καταπολιανή'), said to have been founded by the empress Helena; there are two adjoining churches, one of very early form, and also a baptistery with a cruciform font.

On the north side of the island is the bay of Naoussa (Naussa) or Agoussa, forming a safe and rocky harbour. In ancient times it was closed by a chain or boom. Another good harbour is that of Drios on the south-east side, where the Turkish fleet used to anchor on its annual voyage through the Aegean. The three villages of Tragoulas, Marmora and Kepidi (Κριόπη, pronounced Tschipidi), situated on an open plain on the eastern side of the island, and rich in remains of antiquity, probably occupy the site of an ancient town. They are known together as the "villages of Kephalos," from the steep and lofty headland of Kephalos. On this headland stands an abandoned monastery of St Anthony, amidst the ruins of a medieval castle, which belonged to the Venetian family of the Venieri, and was gallantly though fruitlessly defended against the Turkish general Barbarossa in 1537.

Paros is a island, which is white and semi-transparent, with a cold grain and a very beautiful texture, was the chief source of wealth to the island. The celebrated marble quarries lie on the northern side of the mountain anciently known as Marpessa (afterwards Caprera), a little below a former convent of St Mina. The marble, which was exported from the 6th century B.C., and used by Praxiteles and other great Greek sculptors, was obtained by means of subterranean quarries driven horizontally or at a descending angle into the rock, and the marble thus quarried by lamplight got the name of Lychnites, Lychnites (from lychnos, a lamp), or Lygodos (Plin. H. N. xxxvi. 5, 14; Plato, Eryxias, 400 D.; Athen. v. 2060; Diod. Sic. 2, 53). Several of these tunnels are still to be seen. At the entrance to one of them is a bas-relief dedicated to Pan and the Nymphs. Several attempts to work the marble have been made in modern times, but it has not been exported in any great quantities.

History.—The story that Paros was colonized by one Paros of Phocis, who brought with him a colony of Arcadians to the island (Herod., De rebus publicis, 8; Steph. Bryz. s.v. Πάρος), is one of those etymologizing fictions in which Greek legend abounds. Ancient names of the island are said to have been Plateia (or Pactia). Demetrias, Zaxundias, Hyria, Hyleessa, Minoa and Cabarnis (Steph. Bryz.). From Athens the island afterwards received a colony of Ionians (Schol. Dionys. Per. 535; cf. Herod. i. 171), under whom it attained a high degree of prosperity. It sent out colonies to Thasos (Thuc. iv. 104; Strabo, 487) and Parium on the Hellespont. In the former colony, which was planted in the 15th or 16th Olympiad, the poet Archilochus, native of Paros, is said to have taken part. As late as 385 B.C. the Parions, in conjunction with Dionysius of Syracuse, founded a colony on the Illyrian island of Pharos (Diod. Sic. xv. 43). So high was the reputation of the Parions that they were chosen by the people of Mileteus to arbitrate in a party dispute (Herod. vi. 28 seq.). Shortly before the Persian War Paros seems to have been a dependency of Naxos (Herod. vi. 31). In the Persian War Paros sided with the Persians and sent a trireme to Marathon to support them.

In retaliation, the capital Paros was besieged by an Athenian fleet under Miltiades, who demanded a fine of one talent. But the town offered a vigorous resistance, and the Athenians were obliged to sail away after a siege of twenty-six days, during which they had laid the island waste. It was at a temple of Demeter Thesmophorus in Paros that Miltiades received the wound of which he afterwards died (Herod. vi. 133-136). By means of an inscription Ross was enabled to identify the site of the temple; it lies, in agreement with the description of Herodotus, on a low hill beyond the boundaries of the town. Paros also sided with Xerxes against Greece, but after the battle of Artemisium the Parian contingent remained in Cyclones watching the progress of events (Herod. vii. 67). For this unpatriotic conduct the islanders were punished by Themistocles, who exacted a heavy fine (Herod. viii. 112). Under the Athenian naval confederacy, Paros paid the highest tribute of all the islands subject to Athens 30 talents annually, according to the assessment of Olymp. 88, 4 (429 B.C.). Little is known of the constitution of Paros, but inscriptions seem to show that it was democratic, with a senate (βουλή) and the head of affairs (Corpus inscrip. 2376-2383; Ross, Inscr. ined. i. 147, 148). In 410 B.C. the Athenian general Tharanes found an oligarchy at Paros; he deposed it and restored the democracy (Diod. Sic. xiii. 47). Paros was included in the new Athenian confederacy of 378 B.C., but afterwards, along with Chios, it renounced its connexion with Athens, probably about 357 B.C. Thenceforward the island lost its political importance. From the inscription of Adule we learn that the Cyclades, and consequently Paros, were subject to the Ptolemies of Egypt. Afterwards they passed under the rule of Rome. When the Latins made themselves masters of Constantinople, Paros, like the rest, became subject to Venice. In 1537 it was conquered by the Turks. The island now belongs to the kingdom of Greece.

Among the most interesting discoveries made in the island is the Parian Chronicle (q.v.).

See Tournefort, Voyage du Levant, i. 232 seq. (Lyon, 1717); Clarke, Travels, iii. (London, 1814); Lekke, Travels in Northern Greece, iii. 84 seq. (London, 1835); Proskess, Denkwiirdigkeiten, i. 19 seq. (Stuttgart, 1856); Ross, Reisen auf den griechischen Inseln, i. 4 (Stuttgart, B. Titz, 1860); Fiedler, Reise durch alle Thiele des Konigreiches Griechenland, 1. 179 seq. (Leipzig, 1841); Bursian, Geographie von Griechenland, ii. 483 seq. (Leipzig, 1872).

For the Parian Chronicle, Inscriptiones graecae, xii. 109 seq.

PAROXYSM (Med. Lat. paroxysmus, from the Gr. παροξύνη, to make sharp, ἡξύς), a violent outbreak or display of emotion or feeling. The term is used of a fit of laughter, pain, anger or fear, and particularly an acute stage in a disease is the earliest sense of the word.

PARQUETRY (Fr. parqueterie, from parquet, flooring, originally a small compartment), a term applied to a kind of mosaic of wood used for ornamental flooring. Materials contrasting in colour and grain, such as oak, walnut, cherry, lime, pine, &c. are employed; and in the more expensive kinds the richly figured veneers (parqueterie.) with marquetry borders. The patterns of parquet flooring are entirely geometrical and angular (squares, triangles, lozenges, &c.), curved and irregular forms being avoided on account of the expense and difficulty of fitting. There are two classes of parquetry in use—veneers and solid parquet. The veneers are usually about a quarter of an inch in thickness, and are laid over already existing floors. Solid parquet of an inch or more in thickness consists of single pieces of wood grooved and tongued together, having consequently the pattern alike on both sides.

PARR, CATHERINE (1532-1548), the sixth queen of Henry VIII, was a daughter of Sir Thomas Parr (d. 1517), of Kendal, an official of the royal household. When only a girl she was married to Edward Borough, and after his death in or before 1539 to John Neville, Lord Latimer, who died in 1542 or 1543. Latimer had only been dead a few months when, on the 12th of July 1543, Catherine was married to Henry VIII. at Hampton Court. The new queen, who was regent of England during the king's absence in 1544, acted in a very kindly fashion towards her children; but her patience with the king did not prevent
PARR, SAMUEL—PARRHASIUS

a charge of heresy from being brought against her. Henry, however, would not permit her arrest, and she became a widow for the third time on his death in January 1547. In the same year she married a former lover, Sir Thomas Seymour, not Lord Seymour of Sudeley. Soon after this event, on the 9th of September 1548, she died at the diet castle. Catherine was a plough and chaste woman, and a friend of learning; she wrote The Lamentation or Complaint of a Sinner, which was published after her death.

PARR, SAMUEL (1747–1823), English schoolmaster, son of Samuel Parr, surgeon at Harrow-on-the-Hill, was born there on the 26th of January 1747. At Easter 1752 he was sent to Harrow School as a free scholar, and when he left in 1761 he began to help his father in his practice, but the old surgeon realized that his son’s talents lay elsewhere, and Samuel was sent (1765) to Emmanuel College, Cambridge. From February 1767 to the close of 1771 he served under Robert Sumner as head assistant at Harrow, where he had Sheridan among his pupils. When he head master died in September 1772 Parr, after mainly applying for the position, started a school at Stanmore, which he conducted for five years. Then he became head master of Colchester Grammar School (1776–1778) and subsequently of Norwich School (1778–1786). He had taken priest’s orders at Colchester, and in 1786 was presented to the small rectory of Astbury in Lincolnshire, and three years later to the vicarage of Hatton near Warwick. He exchanged this latter benefice for Wadenhoe, Northamptonshire, in 1789, stipulating to be allowed to reside, as assistant curate, in the parsonage of Hatton, where he took a limited number of pupils. Here he spent the rest of his days, enjoying his excellent library, described by H. G. Bohn in Bibliotheca Parriana (1827), and here his friends, Porson and E. H. Barker, passed many months in his company. The degree of L.L.D. was conferred on him by the university of Cambridge in 1781. Parr died at Hatton vicarage on the 6th of March 1825.

Dr Parr’s writings fill several volumes, but they are all beneath the reputation which he acquired through the variety of his knowledge and dogmatism of his conversation. The chief of them are his Character of Charles James Fox (1800), and his unjustifiable reproof of the Tracts of Warburton and a Warburonian, not admitted into their works, a scathing exposure of Warburton and Hurd. Even amid the terrors of the French Revolution he adhered to Whiggism, and his correspondence included every man of eminence, either literary or political, who adopted the same creed. In private life his model was Johnson. He succeeded in copying his uncouthness and pompous manner, but had neither his humour nor his real authority. He was famous as a writer of epistles and wrote inscriptions for the tombs of Burke, Charles Burney, Johnson, Fox and Gibbon.

There are two memoirs of his life, one by the Rev. William Field (1828), the other, with his works and his letters, by John Johnstone (1828); and E. H. Barker published in 1828–1829 two volumes of his Apologies, a confused mass of information. Parr’s passions were art; he occupied a large room in his house for his pictures, and his son, the Rev. Dr Parr, published an elaborate catalogue of the pictures in it. Parr was always a good man, and a very good Christian, and was a benefactor of many charities. He obtained many hundreds of pounds for them, and the countryside in which he lived had a great deal of charity. He was a great benefactor of the parish church, and the vicarage was a very good one. Parr was a man of great power, and was always in the habit of saying that he was the most powerful man in England. He was a great man, and a very good one, and was always in the habit of saying that he was the most powerful man in England. He was a great man, and a very good one, and was always in the habit of saying that he was the most powerful man in England. He was a great man, and a very good one, and was always in the habit of saying that he was the most powerful man in England. He was a great man, and a very good one, and was always in the habit of saying that he was the most powerful man in England. He was a great man, and a very good one, and was always in the habit of saying that he was the most powerful man in England. He was a great man, and a very good one, and was always in the habit of saying that he was the most powerful man in England. He was a great man, and a very good one, and was always in the habit of saying that he was the most powerful man in England.
as a painter before 300 B.C. Seneca relates a tale that Parrhasius bought one of the Olymophan whom Philip sold into slavery, 346 B.C. and tortured him in order to have a model for his picture of Prometheus; but the story, which is similar to one told of Michelangelo, is chronologically impossible. Another tale recorded of him describes his contest with Zeuxis. The latter painted some grapes so perfectly that birds came to peck at them. He then called on Parrhasius to draw aside the curtain and show his picture, but, finding that his rival's picture was the curtain itself, he acknowledged himself to be surpassed, for Zeuxis had deceived birds, but Parrhasius had deceived Zeuxis. He was universally placed in the very first rank among painters. His skilful drawing of outlines is especially praised, and many of his drawings on wood and parchment were preserved and highly valued by later painters for purposes of study. He first attained skill in making his figures appear to stand out from the background. His picture of Theseus adorned the Capitol in Rome. His other works, besides the obscure subjects with which he is said to have amused his leisure, are chiefly mythological groups. A picture of the Demos, the personified People of Athens, is famous; according to the story, which is probably based upon epigrams, the twelve prominent characteristics of the people, though apparently quite inconsistent with each other, were distinctly expressed in this figure.

PARRICIDE (probably for Lat. patricidia, from pater, father, and cadere, to slay), strictly the murder of a parent; the term however has been extended to include the murder of any relative or of an ascendant by a descendant. The first Roman law against parricide was that of the Lex Cornelia de sicariis et beneficiis (c. 81 B.C.), which enacted that the murderer of a parent should be sewed up in a sack and thrown into the sea, and provided other punishments for the killing of near relatives. The Lex Pompea de parricidio (35 B.C.) re-enacted the principal provisions of the Lex Cornelia and defined parricide as the deliberate murder of the ascendant, and in varying ways prescribed to the cousins, brothers and sisters, uncles and aunts, stepfathers and mothers, fathers and mothers-in-law, patrons and descendants. For the murder of a father, mother, grandfather or grandmother, the Lex Pompea ordained that the guilty person should be whipped till he bled, sewn up in a sack with a dog, a cock, a viper and an ape, and thrown into the sea. Failing water, he was either to be torn in pieces by wild beasts or burned.

English law has never made any legal distinction between killing a parent or other relative and simple murder, and the Netherlands and Germany follow in the same direction. French law has been exceptionally severe in its treatment of parricide. Before the Revolution, the parricide if a male, had to make a recantation of his crime, and then suffered the loss of his right hand; his body was afterwards burned and the ashes scattered to the winds. If the parricide was a female she was burned or hanged. After the Revolution the penalty became simply one of death, but the compilers of the penal code adjudged this insufficient and reintroduced some of the previous provisions: the parricide was brought to the place of execution clad in a shirt, bare-footed, and the head enveloped in a black veil. While he was exposed on the scaffold, an officer read aloud the decree of condemnation; the culprit then had his right hand cut off, and was immediately afterwards executed. On the revision of the penal code in 1832 the cutting off of the right hand was omitted, but the other details remained. Other continental European countries, following the example of France, treat the crime of parricide with exceptional severity.

PARROT (according to Skeat, from Fr. Perrot or Perrot, the diminutive of the proper name Pierre), the name given to various species of the family Psittacidae. It is said by the same authority to be from the Spanish Periquito or Perroquet, a small Parrot, diminutive of Perico, a Parrot, which again may be a diminutive from Pebro, the proper name. Parrot (spelt in various ways in English) is usually applied to the smaller kinds of Parrots, especially those which have long tails, not as Perroquet in French, which is used as a general term for all Parrots, Perruche, or sometimes Perriche, being the ordinary name for what we call Parakeet. The old English Popinjay and the old French Papagaul have almost passed out of use, but the German Papagei and generally to a large and very natural group of birds, which for more than a score of centuries have attracted attention, not only from their gaudy plumage, but, at first and chiefly, it would seem, from the readiness with which many of them learn to imitate the sounds they hear, repeating the words and even phrases of human speech with a fidelity that is often astonishing. It is said that no representation of any parrot appears in Egyptian art, nor does any reference to a bird of the kind occur in the Bible, whence it has been concluded that neither painters nor writers had any knowledge of it. Aristotle is commonly supposed to be the first author who mentions a parrot; but this is an error, for nearly a century earlier Ctesias in his Indica (cap. 3,) under the name of Πίθακος (Pittacus), so neatly described a bird which could speak an "Indian" language—naturally, as he seems to have thought—or Greek—if it had been taught so to do—about as big as a sparrow-hawk (Hieraetus), with a purple face and a black beak, otherwise blue-green (cyaneus) and vermilion in colour, so that there cannot be much risk in declaring that he must have had before him a male example of what is now commonly known as the Blossom-headed Parakeet, and to ornithologists as Palaearcis cyanocataphalus, an inhabitant of many parts of India. After Ctesias comes Aristotle's πτέραξ (Psittace), which Sudevail supposes him to have described only from hearsay. There can be no doubt that the Indian conquests of Alexander were the means of making the parrot better known in Europe, and it is in reference to this fact that another Eastern species of Palaearcis now bears the name of P. alexandri, though from the localities it inhabits it could hardly have had anything to do with the Macedonian hero. That Africa had parrots does not seem to have been discovered by the ancients till long after, as Pliny tells us (vi. 29) that they were first met with beyond the limits of Upper Egypt by explorers employed by Nero. These birds, highly prized from the first, reprobated by the moralist, and celebrated by more than one orator in his panegyric, was not long denied the Romans; they were brought to Rome, and ministered in various ways to the luxury of the age. Not only were they lodged in cages of tortoise-shell and ivory, with silver wires, but they were professedly esteemed as delicacies for the table, and one emperor is said to have fed his lions upon them! With the decline of the Roman Empire the demand for parrots in Europe lessened, and so the supply dwindled, yet all knowledge of them was not wholly lost, and they are occasionally mentioned by one writer or another until in the 15th century began that career of geographical discovery which has since proceeded uninterrupted. This immediately brought with it the knowledge of many more forms of these birds than had ever before been seen. Yet so numerous is the group that even now new species of parrots are not uncommonly recognized.

The home of the vast majority of parrot-forms is unquestionably the tropics, but the popular belief that parrots are tropical birds only is a great mistake. In North America the Carolina parakeet, Conurus carolinensis, at the beginning of the 19th century used to range in summer as high as the shores of lakes Erie and Ontario—a latitude equal to the south of France; and even much later it reached, according to trustworthy information, the junction of the Ohio and the Mississippi, though now its limits have been so much curtailed that its occurrence in any but the Gulf States is doubtful. In South America, at least four species are found in Chile or the La Plata region, and one, Conurus patagonus, is pretty common on the bleak coast of the Strait of Magellan. In Africa it is true that no species is known to extend to within some ten degrees of the tropic of Cancer; but Pionias robustus inhabits territories Italian Papagad still continue in vogue. These names can be traced to the Arabic Babagdi, but the source of that word is unknown. The Anglo-Saxon name of the Parrot, a river in Somerset, is Pedrea or Petrea; this was the first sight looks as if it had to do with the proper name, Petrus; but Skeat believes there is no connexion between them—the latter portion of the word being rō, a stream. The passage seems to have escaped the notice of all naturalists except W. J. Broderip, who mentioned it in his article "Psittacidae," in the Penny Cyclopaedia (xiv. 83).
lying quite as far to the southward of the tropic of Capricorn. In India the northern range of the group is only bounded by the mountains, and the southern extent of the range of a Parrot have been recognized for the Maori are not only abundant over the whole of the Malay Archipelago, as well as Australia and Tasmania, but two very well-defined families are peculiar to New Zealand and its adjacent islands (see *Kaka* and *Nestor*). No parrot has recently inhabited the Palearctic Region, and but one (the *Conurus carolinensis*, just mentioned) probably belongs to the Nearctic; nor are parrots represented by many different forms in either the Ethiopian or the Indian Regions. In continental Asia the distribution of parrots is rather remarkable. None extend farther to the westward than the valley of the Indus, which, considering the nature of the country in Baluchistan and Afghanistan, is perhaps intelligible enough; but it is not so easy to understand why none are found either in Cochin China or China proper; and they are also wanting in the Philippine Islands, which is the more remarkable and instructive when we find how abundant they are in the groups a little farther to the southward. Indeed, A. R. Wallace has well remarked that the portion of the earth's surface which contains the largest number of parrots, in proportion to its area, is undoubtedly that covered by the islands extending from Celebes to the Solomon group. "The area of these islands is probably not one-fifteenth of that of the four tropical regions, yet they contain from one-fifth to one-fourth of all the known parrots" (Geogr. Distr. Animals, ii. 330). He goes on to observe also that in this area are found many of the most remarkable forms—all the red Lories, the great cockatoos, the pugmy *Nasiterna* and other singularities. In South America the species of parrots, though numerically nearly as abundant, are far less diversified in form, and all of them seem capable of being referred to two, or at most, three sections. The species that has the widest range, and that by far, is the common Ring-necked Parakeet, *Psittacornis torquatus*, a well-known cage-bird which is found from the mouth of the Gambia across Africa to the coast of the Red Sea, as well as throughout the whole of India, Ceylon and Burmah to Tenasserim. On the other hand, there are plenty of other species which are restricted to an extremely small area—often an island of insignificant size, as *Conurus sanctoclemens*, confined to the island of St Thomas in the Antilles, and *Psilophasia cusu* to that of Rodrigues in the Indian Ocean—to say nothing of the remarkable instance of *Nestor productus* (see *Nestor*). The systematic treatment of this very natural group of birds has long been a subject of much difficulty. A few systematists, among whom C. L. Bonaparte was chief, placed them at the top of the class, conceiving that they were the analogues of the *Primates* among mammals. T. H. Huxley recognized the *Psittacorumphae* as forming one of the principal groups of Carnate birds, and they are now generally regarded as forming a suborder *Psilatacidae* of the Cuculiform birds (see Bird). Owing to the erroneous number of forms and the close similarities of structure, the subdivision of the group has presented great difficulties. Buffon was unaware of the existence of some of the most remarkable forms of the group, in particular of the *Nestorinae* and *Ara*; and R. Mearns of the Allier in France, by A. Milne-Edwards (Ois. Fais. France, vol. ii. p. 525, pl. cl.), and are said by him to show the greatest resemblance to the common Grey Parrot of Africa, *Psittacus erithacus*, though having also some affinity to the Ring-necked Parrot of the same country, *Psittacornis torquatus*. He refers them, however, to the same genus as the former, under the name of *Psilatacis verreauxi*. The statements that have been made, and even repeated by writers of authority, as to the occurrence of "a green parrot," "a green bird," or "a grey parrot," in Syria, *P. psittacula* (Gmel. J. & C. Sulp. Tars. Tars. 443. 532), and of a parrot in Turkestan (Jour. As. Soc. Bengal, vii. 1807) originated with gentlemen who had no ornithological knowledge, and are evidently erroneous. The principal difficulty, however, that the African examples of this bird are said to be distinguishable from the Asiatic by their somewhat shorter wings and weaker bill, and hence they are considered by some authorities to form a distinct species or subspecies, *Ps. docula*; but in thus regarding them the difference of locality seems to have influenced opinion, and without that difference they would scarcely have been separated, for in many other groups of birds distinctions so slight are regarded as barely evident of local races. *Strigops* and *Nestor*; but he began by making two great divisions of those that he did know, separating the parrots of the Old World from the parrots of the New, and subdividing each of these divisions into various sections, in accordance with the names they had received in popular language—a practice he followed on many other occasions, for it seems to have been with him a belief that there is more truth in the discrimination of the unlearned than the scientific are apt to allow. In 1867-1868 Dr O. Fisch published at Leiden an elaborate monograph of the parrots,4 regarding them as a family, in which he admitted 26 genera, forming 5 subfamilies: (1) that composed of *Strigops* (Kaka), only; (2) that containing the crested forms or cockatoo; (3) one which he named *Sittacinae*, comprising all the long-tailed species—a somewhat heterogeneous assemblage, made up of *Macaws* (g.v.) and what are commonly known as parakeets; (4) the parrots proper with short tails; and (5) the so-called "brush-tongued" parrots, consisting of the *Lories* (g.v.) and *Nestors* (g.v.). In 1874 A. H. Garrod communicated to the Zoological Society the results of his dissection of examples of 82 species of parrots, which had lived in its gardens, and these results were published in its Proceedings for that year (pp. 586-598, pls. 70, 71). Summarily expressed, Garrod's scheme was to divide the parrots into two families, *Palaeornithidae* and *Psittacidae*, assigning to the former three subfamilies, *Palaeornithinae*, *Cacatinae* and *Strigopinae*, and to the latter four, *Arinae*, *Pyrrhurinae*, *Platycercinae* and *Chrysothinae*. That each of these sections, except the *Cacatinae*, is artificial any regard to osteology would show. In the *Journal für Ornithologie* for 1881 A. Reichenow published a *Conpectsus Psittacorum*, founded, as several others5 have been, on external characters only. He makes 9 families of the group, and recognizes 45 genera, and 443 species, besides subspecies. His grouping is generally very different from Garrod's, but displays as much artificiality; for instance, *Nestor* is referred to the family which is otherwise composed of the cockatoos. The system now generally accepted is based on a combination of external and anatomical characters, and is due to Count T. Salvadori (Cat. Birds, Brit. Mus. XX., 1891), and H. F. Gadow (Bronn's *Thier-Reich*, vol. 1803). About 80 genera with more than 500 species are recognized, divided into the family *Psittacidae* with the subfamilies *Strigopinae*, *Psitacinae* and *Cacatinae*, and the family *Trichoglossidae* with the subfamilies *Cyclopitacinae*, *Lorinae* and *Nestorinae*. The headquarters of parrots are in the Australian Region and the Malay countries; they are abundant in South America; in Africa and India the number of forms is relatively small; in Europe and North Asia there are none now alive, in North America only one. Parrots are gregarious and usually feed and roost in companies, but are at least temporally monogamous. Most climb and walk well; the flight is powerful but low and undulating in most. The food is varied but chiefly vegetable, whilst parrots are alone amongst birds in holding the food in the claws. The usual cry is harsh and discordant, but many softer notes are employed. A large number of forms learn in captivity to talk and whistle, the well-known red-tailed grey parrot (*Psittacus elegans*) being the most famous. The eggs are usually laid in holes in trees, rocks, or the ground, and being formed. The larger species produce one to three, the smaller as many as twelve, the colour being dull white. The young when hatched are naked and helpless. (A. N.) PARROT-FISHES, more correctly called *Parrot-Wrasse*, marine fishes of the family *Scardidae* closely allied to the wrasses or *Labridae*. The family contains eight genera of which the principal are *Scarus*, *Pseudoscara*, *Odan* and *Sparisoma*. They are easily recognized by their large scales, of which there are from twenty-one to twenty-five in the lateral line, by having invariably nine spines and ten rays in the dorsal fin and two spines with eight rays in the anal, and especially by their singular

---

4 *Die Papageien, monographisch bearbeitet*. 5 Such, for instance, as Kuhl's treatise with the same title, which appeared in 1820, and Wagler's *Monographia Psittacorum*, published in 1832—both good of their kind and time.
dentition, of jaws as well as pharynx. The teeth of the jaws are
soldered together, and form a sharp-edged beak similar
to that of a parrot, but without a middle projecting point, and
the upper and lower beak are divided into two lateral halves
by a median suture. In a few species the single teeth can be
still distinguished, but in the majority (Pseudoscaras) they are
united into a homogeneous substance with polished surface.
By this sharp and hard beak parrot-fishes are enabled to bite
or scrape off those parts of coral-stocks which contain the
polyplps or to cut off branches of tough fucus, which in some
of the species forms the principal portion of their diet.
The process of triturating the food is performed by the pharyngeal
teeth, which likewise are united, and form plates with broad
masticatory surfaces, not unlike the grinding surface of the molar
of the elephant. Of these plates there is one pair above, opposed
to the single one which is coalesced to the lower pharyngeal bone.
The contents of the alimentary canal, which are always found to be finely divided and reduced to a pulp, prove
the efficiency of this triturating apparatus; in fact, ever since
the time of Aristotle it has been maintained that the Scarus
ruminates. Nearly one hundred species of parrot-fishes are known
from the tropical and sub-tropical parts of the Indo-Pacific and
Atlantic Oceans; like other coral-feeding fishes, they are absent
on the Pacific coasts of tropical America and on the coast of
tropical West Africa. The most celebrated is the Scarus of
the Mediterranean. Beautiful colours prevail in this group of
wrasses, but are subject to great changes and variations in the
same species; almost all are evanescent and cannot be
preserved after death. The majority of parrot-fishes are eable,
some even esteemed; but they (especially the carnivorous
kinds) not unfrequently acquire poisonous properties after
they have fed on corals or medusae containing an acid poison.
Many attain to a considerable size, upwards of 3 ft. in length.

PARRY, SIR CHARLES HUBERT HASTINGS, Bart.,
English musical composer (1848—), second son of Thomas
Gambier Parry, of Highnam Court, Gloucester, was born at
Bournemouth on the 27th of February 1848. He was educated
at Malvern, Twyford, near Winchester, Eton (from 1861),
and Exeter College, Oxford. While still at Eton he wrote
music, two anthems being published in 1865; a service in D
was dedicated to Sir John Stainer. He took the degree of Mus.B.
at Oxford at the age of eighteen, and that of B.A. in 1870;
he then left Oxford for London, where in the following year he
entered the boy's school at St. Mary's, Redhill. He afterwards
joined the staff of the School, and was appointed a professor
at Exeter College. He studied successively with H. H. Pierson (at Stuttgart),
Stendal Bennett and Macfarren; but the most important
part of his artistic development was due to Edward Dannreuther.
Among the larger works of this early period must be mentioned
an overture, Guillewm de Castealn (Crystal Palace, 1879),
a pianoforte concerto in F sharp minor, played by Dannreuther
at the Crystal Palace and Richter concerts in 1880, and his
first choral work, the Scenes from Prometheus Unbound,
produced at the Gloucester Festival, 1880. These, like a symphony
in G given at the Birmingham Festival of 1882, seemed strange
even to educated hearers, who were confused by the intricacy
of treatment. It was not until his setting of Shirley's ode,
The Glory of St. Martin's was brought out at Gloucester,
1883, and the Partita for violin and solo viola, which was
published about the same time, that Parry's importance came to
be realized.
With his sublime eight-part setting of Milton's Blst Pair of Sirens
(Bach Choir, 1887) began a fine series of compositions to
sacred or semi-sacred words. In Judith (Birmingham, 1888),
the Ode on St. Cecilia's Day (Leeds, 1889), L'Allegro ed il Penseroso
(Norwich, 1890), De Profundis (Hereford, 1891), The Lotus Eaters
(Cambridge, 1892), Job (Gloucester, 1892), King Saul
(Birmingham, 1894), Invocation to Music (Leeds, 1895), Magnificat
(Hereford, 1897), A Song of Darkness and Light (Gloucester,
1898), and Te Deum (Hereford, 1900), are revealed the highest
qualities of music. Skill in piling up climaxes after climaxes,
and command of every choral resource, are the technical qualities
most prominent in these works; but in his orchestral compositions,
such as the three later symphonies, in F, C and E minor,
in two suites, one for strings alone, and above all in his Symphonic
Variations (1897), he shows himself a master of the orchestra,
and his experiments in modification of the conventional classical
forms, such as appear in the work last named, or in the Nineteen
Variations for Piano forte Solo, are always successful. His
music to The Birds of Aristophanes (Cambridge, 1883) and
The Frogs (Oxford, 1892) are striking examples of humour in
music; and that to Agamemnon (Cambridge, 1900) is among the
most impressive compositions of the kind. His chamber music,
exquisite part-songs and solo songs maintain the high standard
of his greater works. At the opening of the Royal College of
Music in 1883 he was appointed professor of composition and
of musical history, and in 1894, on the retirement of Sir George
Grove, Parry succeeded him as principal. He was appointed
Choragus of Oxford University in 1893, succeeding Stainer,
in the professorship of the university in 1894. He received
the honorary degree of Mus.D. at Cambridge 1883, Oxford 1884,
Dublin 1891; and was knighted in 1898. Outside the domain
of creative music, Parry's work for music was of the greatest
importance: as a contributor of many of the most important
articles on musical forms, &c., in Grove's dictionary, his literary
work first attracted attention; in his Studies of Great Composers
musical biography was treated, almost for the first time, in a
really enlightened and enlightening way; and his Art of Music
is a splendid monument of musical literature, in which the
trend of evolution is applied to musical history with wonderful
skill and success.

PARRY, SIR WILLIAM EDWARD (1796—1855), English
rear-admiral and Arctic explorer, was born in Bath on the 19th
of December 1796, the son of a doctor. At the age of thirteen
he joined the flag-ship of Admiral Cornwallis in the Channel
fleet as a first-class volunteer, in 1806 became a midshipman,
and in 1810 was promoted to the rank of lieutenant in the
"Alexander" frigate, which was employed for the next three
years in the protection of the Spitzbergen whale fishery. He
took advantage of this opportunity for the study and practice
of astronomical observations in northern latitudes, and after-
wards published the results of his studies in a small volume on
Nautical Astronomy by Night (1816). From 1815-1817 he served
on the North American station. In 1818 he was given the command of the "Alexander" brig in the Arctic
expedition under Captain (afterwards Sir) John Ross. This expedition
returned to England without having made any new discoveries
or discoveries of any importance. In 1819 Parry, now commander
of the Polar discovery had been hitherto relinquished just at a
time when there was the greatest chance of succeeding," in
the following year obtained the chief command of a new Arctic
expedition, consisting of the two ships "Griper" and "Hecla."
This expedition returned to England in November 1820 after
a voyage of almost unprecedented Arctic success (see Polar
Regions), having accomplished more than half the journey
from Greenland to Bering Strait, the completion of which solved
the ancient problem of a North-west Passage. A narrative
of the expedition, entitled Journal of a Voyage to discover a
North-west Passage, appeared in 1821. Upon his return
Lieutenant Parry was promoted to the rank of commander.
In May 1822 he set sail in the "Hecla" and "Griper" to discover
the North-west Passage, but was compelled to return to England in October 1823 without achieving
his purpose. During his absence he had in November 1821 been
promoted to post rank, and shortly after his return he was
appointed acting hydrographer to the navy. His Journal of
a Second Voyage, &c., appeared in 1824. With the same ships
he undertook a third expedition on the same quest in 1824,
but was again unsuccessful, and the "Griper" being wrecked,
he returned home in October 1825 with a double ship's company.
Of this voyage he published an account in 1826. In the following
year he obtained the sanction of the Admiralty for an attempt
on the North Pole from the northern shores of Spitzbergen,
and his extreme point of 84° 45' N. lat. remained for 49 years
the highest latitude attained. He published an account of this
journey under the title of Narrative of the Attempt to reach the
North Pole.
PARRY—PARESES

North Pole, &c. (1827). In April 1830 he was knighted. He was subsequently selected for the post of comptroller of the newly created department of steam machinery of the Navy, and held this office until his retirement from active service in 1846, when he was appointed captain-superintendent of Haslar Hospital. He attained the rank of rear-admiral in 1852, and in the following year became a governor of Greenwich Hospital, and retained this post till his death on the 8th of July 1855. The religious side of Sir Edward Parry’s character was strongly marked, and besides the journals of his different voyages he was also the author of a Lecture to Seamen, and Thoughts on the Parental Character of God.

PARRY (from Fr. parer, to ward off), to turn aside a blow from a weapon. The term is used especially of a defensive movement of the sword or foil in fencing, hence, by transference, to ward off any attack, to turn aside an objectionable question. (See FENCING, &c.)

PARESES, or Parsees, the followers in India of Zoroaster (Zarathustra), being the descendants of the ancient Persians who emigrated to India on the conquest of their country by the Arabs in the 8th century. They first landed at Sanjan on the coast of Gujarat, where the Hindu rulers received them hospitably. To this day their vernacular language is Gujarati, which they have cultivated in literature and journalism. Their settlement in Bombay dates only from the British occupation of that island. In 1901 the total number of Parsees in all India was 94,000, of whom all but 7000 were found in the Bombay presidency and the adjoining state of Baroda, the rest being widely scattered as traders in the large towns.

Among Parsees the men are well formed, active, handsome and intelligent. They have light olive complexions, a fine aquiline nose, bright black eyes, a well-turned chin, heavy arched eyebrows, thick sensual lips, and usually wear a light curling moustache. The women are delicate in frame, with small hands and feet, fair complexions, beautiful black eyes, finely arched eyebrows, and a profusion of long black hair, which they dress to perfection, and ornament with pearls and gems. The Parsees are much more liberal in their treatment of women than any other Asiatic race; they allow them to appear freely in public, and leave them the entire management of household affairs.

The characteristic costume of the Parsees (now frequently abandoned) is loose and flowing, very picturesque in appearance, and admirably adapted to the climate in which he lives. The head is covered with a turban, or a cap of a fashion peculiar to the Parsees; it is made of stiff material, something like the European hat, without any rim, and has an angle from the top of the forehead backwards. It would not be respectful to uncover in presence of an equal, much less of a superior. The colour is chocolate or maroon, except with the priests, who wear a white turban.

A Parsee must be born upon the ground floor of the house, as is the teachings of their religion require life to be commenced in humility, and by “good thoughts, words and actions” alone can an elevated position be attained either in this world or the next. The mother is not seen by any member of the family for forty days. Upon the seventh day after the birth an astrologer is invited to cast the nativity of the child. He has first to enumerate the names which the child may bear, so that the parents may make choice of one of them. Then he draws on a wooden board a set of hieroglyphs in chalk, and his dexterity in counting or recounting the stars under whose region or influence the child is declared to be born is marvelled at by the superstitious creatures thronging around him. This document is preserved in the family archives as a guidance and encouragement to the child through life. At the age of seven or thereabouts, according to the judgment of the priest, the first religious ceremony is performed upon the young Parsee. He is first subjected to the process of purification, which consists of an ablation with nirang (cow-urine). The ceremony consists in investing him with the kusti, or girdle of his faith. This is a cord, woven by women of the priestly class, composed of seventy-two threads, representing the seventy-two chapters of the Yasna, a portion of the Zend-Avesta, in the sacredness of which the young neophyte is figuratively bound. The priest ties the cord around the waist as he pronounces the benediction upon the child, throwing upon his head at each sentence slices of fruit, seeds, perfumes and spices. He is thus received into the religion of Zoroaster, and is henceforth considered morally accountable for his acts. If a child die before the performance of this ceremony he is considered to have gone back to Ahurā-Mazdā, who gave him, as pure as he entered into this world, having not reached the age of accountability.

The marriages of children engage the earliest attention of the parents. The wedding day having been fixed by an astrologer, who consults the stars for a happy season, a Parsee priest goes from house to house with a list of the guests to be invited, and delivers the invitations with much ceremony. The father of the bride waits upon near relatives and distinguished personages, soliciting the honour of their attendance. A little before sunset a procession is formed at the house of the bridegroom, and proceeds with a band of music, amid great pomp and ceremony, to the house of the bride’s father. Here a number of relatives and friends are collected at the door to receive the bridegroom with due honour. Presents are sent before, according to the time-honoured custom of the East. Upon the arrival of the procession at the house of the bride the gentlemen gallantly remain outside, leaving room for the ladies to enter the house as the escort of the bridegroom. As he passes the threshold his future mother-in-law meets him with a tray filled with fruits and rice, which she strews at his feet. The fathers of the young couple are seated side by side, and between them stands the priest ready to perform the ceremony. The young couple are seated in two chairs opposite each other, their right hands tied together by a silken cord, which is gradually wound around them as the ceremony progresses, the bride in the meantime being concealed with a veil of silk or muslin. The priest lights a lamp of incense, and repeats the nuptial benediction first in Zend and then in Sanskrit. At the conclusion of the ceremony they each throw a handful of rice upon some grains of rice, and the most expeditious in performing this feat is considered to have got the start of the other in the future control of the household, and receives the applause of the male or female part of the congregation as the case may be. The priest now throws some grains of rice upon the heads of the married pair in token of wishing them abundance; bouquets of flowers are handed to the assembled guests, and rose-water is showered upon them. The bride and bridegroom now break some sweetmeats, and, after they have served each other, the company are invited to partake of refreshments. At the termination of this feast the procession re-forms, and with lanterns and music escorts the bridegroom back to his own house, where they feast until midnight. As midnight approaches they return to the house of the bride, and escort her, with her dowry, to the house of the bridegroom, and, having delivered her safely to her future lord and master, disperse to their respective homes. Eight days afterwards a wedding feast is given by the newly-married couple, to which only near relatives and particular friends are invited. The house is spread entirely of vegetables, which at each course the wine is served, and toasts are proposed, as “happiness to the young couple.” &c.

The funeral ceremonies of the Parsees are solemn and imposing. When the medical attendant declares the case hopeless a priest advances to the bed of the dying man, repeats sundry texts of the Zend-Avestā, the substance of which tends to afford him consolation, and breathes a prayer for the forgiveness of his sins. After life is extinct a funeral sermon is delivered by the priest, in which the deceased is made the subject of an exhortation to his relatives and friends to live pure, holy and righteous lives, so that they may hope to meet again in paradise. The body is then taken to the ground floor where it was born, and, after being washed and perfumed, is dressed in clean white clothes, and laid upon an iron bier. A dog is brought in to take a last look at his inanimate master in order to drive away the evil spirits. This
ceremony is called sadgād. A number of priests attend and repeat prayers for the repose of the soul of the departed. All the male relations of the deceased go to the door, bow down, and raise their two hands from the floor to their heads to indicate their respect for the departed. The body, when put upon the bier, is covered over from head to foot. Two attendants bring it out of the house, holding it low in their hands, and deliver it to four pall-bearers, called nassalār, clad in well-washed, white clothes. A procession is formed by the male friends of the deceased, headed by a number of priests in full dress, to follow the body to the dakhma, or "tower of silence." In Bombay these towers are erected in a beautiful garden on the highest point of Malabar Hill, amid trees swarming with vultures; they are constructed of stone, and rise some 25 ft. high, with a small door at the side for the entrance of the body. Upon arriving at the "tower of silence" the bier is laid down, and prayers are said in the sgrē, or house of prayer, containing a fire-sanctuary, which is erected near the entrance to the garden. The attendants then raise the body to its final resting-place, lay it upon its stony bed, and retire. A round pit about 6 ft. deep is surrounded by an annular paved area about 7 ft. wide, on which the body covered with the vultures, where it is soon denuded of flesh, and the bones fall through an iron grating into a pit beneath, from which they are afterwards removed into a subterranean entrance prepared for their reception. On the third day after death an assemblage of the relatives and friends of the deceased takes place at his residence, and thence proceed to the Atish-bahrūm, or "fire-temple." The priests stand before the urns in which the celestial fire is kept burning, and recite prayers for the soul of the deceased. The son or adopted son of the deceased kneels before the high-priest, and promises due performance of all the religious duties and obsequies to the dead. The relatives and friends then hand the priest a list of the contributions and charities which have been subscribed in memory of the deceased, which concludes the ceremony of "rising from mourning," or "the resurrection of the dead." On each successive anniversary of the death of a Parsee funeral ceremonies are performed in his memory. An iron framework is erected in the house, in which a funeral pyramid and flowers cultivated to bloom in memory of the departed. Before the frame, iron stands, are placed copper or silver vases, filled with water and covered with flowers. Prayers are said before these iron frames two or three times a day. These ceremonies are called mākiād, or "ceremonies of departed souls." The Parsees of India are divided into two sects, the Shensahis and the Kadmis. They do not differ on any point of faith; the dispute is confined to a quarrel as to the correct chronological date for the computation of the era of Yazdegird, the last king of the Sassanian dynasty, who was dethroned by the caliph Omar about A.D. 640. The difference has been productive of no other inconvenience than arises from the variation of a month in the celebration of the festivals. The Parsees compute time from the fall of Yazdegird. Their calendar is divided into twelve months of thirty days each; the five other days, being added for holy days, are called chait. Each month is divided into a particular angel of bliss, under whose special protection it is passed. On feast days a division of five watches is made under the protection of five different deities. In midwinter a feast of six days is held in commemoration of the six periods of creation. About the 21st of March, the vernal equinox, a festival is held in honour of agriculture, when planting begins. In the middle of April a feast is held to celebrate the creation of trees, shrubs and flowers. On the fourth day of the sixth month a feast is held in honour of Sahrēvar, the deity presiding over mountains and mines. On the sixteenth day of the seventh month a feast is held in honour of Mithra, the deity presiding over and directing the course of the sun, and also a festival to celebrate truth and friendship. On the tenth day of the eighth month a festival is held in honour of Farvardin, the deity who presides over the departed souls of men. This day is especially set apart for the performance of ceremonies for the dead. The people attend on the hills where the "towers of silence" are situated, and perform in the sgrēs prayers for the departed souls. The Parsee scriptures require the last ten days of the year to be spent in doing deeds of charity, and in prayers of thanksgiving to Ahrūr-Mazādā. On the day of Yazdegird, or New Year's Day, the Parsees emulate the western world in rejoicing and social intercourse. They rise early, and after having performed their prayers and ablutions dress themselves in a new suit of clothes, and sally forth to the "fire-temples," to worship the emblem of their divinity, the sacred fire, which is perpetually burning on the altar. Unless they duly perform this ceremony they believe their souls will not be allowed to pass the bridge "Chinvad," leading to heaven. After they have performed their religious services they visit their relations and friends, when the ceremony of hāmiyār, or joining hands, is performed. The ceremony is a kind of greeting by which they wish each other "a happy new year." Their relatives and friends are invited to dinner, and they spend the rest of the day in feasting and rejoicing; alms are given to the poor, and new suits of clothes are presented to servants and dependants.

There are only two distinct classes among the Parsees—the priests (dostār, or high priest; mobeds, or the middle order; and muktad, or the lowest order) and the people (behudin, behdin, or "followers of the best religion"). The priestly office is hereditary, and no one can become a priest who was not born such; but the son of a priest may become a layman.

The secular affairs of the Parsees are managed by an elective committee, or panchāyat, composed of six dostār and twelve mobeds, making a council of eighteen. Its functions resemble the Venetian council of ten, and its objects are to preserve unity, peace and justice amongst the followers of Zoroaster. One law of the panchāyat is singular in its difference from the custom of any other native community in Asia; nobody who has a wife living shall marry another, except under peculiar circumstances, such as the barrenness of the living wife, or her immoral conduct. Recently a serious difference arose among the Parsees of Bombay on the question of proselytism. A Parsee had married a French lady, who took the necessary steps to adopt the religion of her husband. But it was decided by the High Court, after prolonged argument, that, though the creed of Zoroaster theoretically admitted proselytes, their admission was not consistent with the practice of the Parsees in India.

Their religion teaches them benevolence as the first principle, and no people practise it with more liberality. A beggar among the Parsees is unknown, and would be a scandal to the society. The sagacity, activity and commercial enterprise of the Parsees are proverbial in the East, and their credit as merchants is almost unlimited. In this connexion may be mentioned the well-known names of Sir Jamsetjee Jeejeebhoy and Sir Dinshaw Petit, both baronets, and also of J. N. Tata, founder of the Institute of Scientific Research at Bangalore. The Parsees have shown themselves most desirous of receiving the benefits of an English education; and their eagerness to embrace the science and literature of the West has been conspicuous in the wide spread of female education, and in the activity shown in studying their sacred writings in critical texts. The Parsees are more numerous to the professions of law and medicine, and a Parsee barrister was appointed a judge of the High Court at Bombay in 1906. Two Parsees have also been the only natives of India elected to the House of Commons.

See Menant, Les Parsis (Paris, 1898); Dosabhai Framji Kara, History of the Parsees (London, 1884); Seervai and Patel, Gujarāt Parsees from the Earliest Times (Bombay, 1898).

PARSIFAL BELL-INSTRUMENT (Ger. Parsifal Klavier-Instrument), a stringed instrument ingeniously constructed by Schweigut, of Carlsruhe, from Dr Mottl's design, as a substitute for the church bells in Wagner's Parsifal. This instrument has been constructed somewhat on the principle of the grand piano; the massive frame is shaped like a billiard table. There are five notes, each with six strings, three in unison giving the fundamental note and three an octave higher. The strings are struck by large hammers, covered with cotton-wool, which the performer sets in motion by a strong elastic blow from his fist. The hammers are attached to arms 22 in. long, screwed to a
PARSIMONY, LAW OF—PARSONS, T.

strong wooden span bridge placed horizontally above the strings at about two-fifths of the length from the front. On the point of the arm is the name of the note, and behind this the felt ledge struck by the fist. Two-by-two plank bridges and two wrest-plank bridges, one set for each octave, determine the vibrating length of the strings, and the bridge, as in other strung instruments, is the medium through which the vibrations of the strings are communicated to the soundboard. The arrangement of pegs and wrest-pins is much the same as on the piano.

The realism demanded by modern dramatic music takes the resources of the orchestra to the utmost when the composer aims at reproducing on the stage the effect of church bells, as, for instance, in the Golden Legend, Cavalleria rusticana, Pagliacci, Rienzi and Parsifal. The most serious difficulty of all arose in the last-mentioned drama, where the solemnity of the scene and its deep religious significance demand a corresponding atmosphere on the stage. Real church bells for the notes Wagner has scored in the familiar chime would overpower the orchestra. All substitutes for bells were tried in vain; no other instrument, leaving aside the question of pitch, gave a tone in the least similar to that of the bell. Indepently of the rich harmonics composed of tenor and bass the bell has two distinct simultaneous notes, first the top tone, which gives the pitch, and the hum tone or lower accompanying note. On the interval separating the hum from the top tone depend the dignity and beauty of the bell tone and the emotional atmosphere produced. A strung instrument, similar to the one here described but with four notes only, was used at Bayreuth for the first performance of Parsifal, and with it tam-tams or gongs, but after many trials the following combination was adopted as the best makeshift: (1) the strung instrument with four keys; (2) four tam-tams or gongs tuned to the pitch of the four notes composing the chime; (3) a bass-tuba, which plays the notes staccato in quavers to help make them more distinct; (4) a fifth tam-tam, on which a roll is executed with a drumstick.

The special peal of hemispherical bells constructed for Sir A. Sullivan’s Golden Legend is the only other successful substitute known to the writer; the lowest of these bells is a minor third higher than the lowest note required for Parsifal, and the aggregate weight of the four bells is 11 cwt. The bells are struck with mallets and have both top and hum tone. (K.S.)

PARSIMONY, LAW OF (Lat. parsimonia, from parcere, to save), the name given to William of Occam’s principle “Entia non sunt multiplicanda praeter necessitatem,” i.e. that it is scientifically unsound to set up more than one hypothesis at once to explain a phenomenon. This principle is known as “Occam’s razor” (see Occam, William of).

PARSLEY, a hardy biennial herb known botanically as Petroselinum sativum (natural order Umbelliferae), the leaves of which are much used for garnishing and flavouring. It occurs as a garden escape in waste places in Britain and it is doubtful if it is known anywhere as a truly wild plant; A. de Candolle, however (Origin of Cultivated Plants) considers it to be wild in the Mediterranean region. It grows best in a partially shaded position, in good soil of considerable depth and not too light; a thick dressing of manure should be given before sowing. For a crop grown for the table, sow as early as possible in February as the weather permits, in April or early in May and in July—the last for the winter supply in a sheltered position with southern exposure. Sow thinly in drills from 12 to 15 in. apart and about 1 in. deep; thin out to 3 in. and finally to 6 in. each. In winter the plants should be protected by frames or hand-glasses. The curled and mossy-leaved varieties are preferable. The Hamburg or turnip-rooted variety is grown for the root, which is cut up and used for flavouring.

PARSNIP, botanically known as Pastinaca sativa (or Peucedanum sativum), a member of the natural order Umbelliferae, found wild in roadsides and waste places in England and throughout Europe and temperate Asia, and as an introduced plant in North America. It has been cultivated since the time of the Romans for the sake of its long fleshy whitish root, which has a peculiar but agreeable flavour. It succeeds best on a sandy loam, which should be trenched and manured in the previous autumn, the manure being well buried. The seed should be sown the last week in March, in rows 15 to 18 in. apart, and finally thinned out to 1 ft. apart. The leaves will decay in October or November, when a portion of the roots may be taken up and stored in dryish sand for immediate use, the rest being left in the ground, to be taken up as required, but the whole should be removed by February to a dry cool place, or they will begin to grow. The best sorts are the Hollow-crowned, the Maltese and the Student. Dusting the ground with sift when sowing the seed and again when the leaves appear will keep the plants free from pests.

PARSON, a technical term in English law for the clergyman of the parish. It is a corruption of persona, the parson being, as it were, the persona ecclesiæ, or representative of the Church in the parish. Parson imparsone (persona impersonale) is he that as rector is in possession of a church parochial, and of whom the church is full, whether it be presentative or impropriate (Coke upon Littleton, 306 b). The word parson is properly used only of a rector. A parson must be in holy orders; hence a lay rector could not be called a parson. There are four requisites to the dignity of a parson, which, with the exception of the last, is not required of a rector for the church. These requisites are (1) the possession of ecclesiastical wardship, (2) the right of patronage, (3) the right of presentation, and (4) the right of institution and induction. The parson is tenant for life of the parsonage house, the glebe, the tithes and other dues, so far as they are not appropriated.

See also RECTOR; VICAR; BENEFICE; and TITHES.

PARSONS (or PERSONS), ROBERT (1546–1610), English Jesuit and political agitator, son of a blacksmith, was born at Netherton, Somerset, on the 24th of June 1546. The vicar of the parish gave him instruction and procured his entrance in 1563 as an exhibitioner to Balliol College, Oxford. He graduated B.A. in 1568, and M.A. in 1572. He was fellow, bursar and dean of his college, but in 1574 he resigned or was dismissed his fellowship and offices, for reasons which have been disputed, some alleging improprieties of conduct, and others suspected disloyalty. Soon after his resignation he went to London, and thence in June to Louvain, where he entered the Roman Catholic Church and spent some time in the company of Father William Good, a Jesuit. In July 1575 he entered the Jesuit Society at Rome. In 1580 he was selected, along with Edmund Campion, a former associate at Oxford, and others, to undertake a secret religious and political mission to England. The two emissaries engaged in political intrigue in England and on the Continent. In 1581 Campion was arrested, but Parsons made his escape to Rouen, whence he returned to Rome, where he continued to direct the English mission. In 1588 he went to Spain, where he remained for nine years, founding seminaries for the training of English Jesuits at Valladolid, Lucar, Seville, Lisbon and St Omer. On the death of Cardinal Allen in 1594 he made strenuous efforts to be appointed his successor. He failed in this, but was made rector of the English college at Rome in 1597, and died there on the 18th of April 1610.

Parsons was the author of over 30 polemical writings, mostly tracts. Among the more important are Certayne Reasons why Catholickes refuse to goe to Church (Douai, 1580), A Christian Direc- torie guiding Men in their Salvation (London, 1583–1591, 2 parts), A Catechism about the Succession to the Crowne of England (1594), Treatise of the Three Coverstations of England (1603–1604, 3 parts), an answer to Foxe’s Acts and Monuments. For portrait, see Gentleman’s Magazine, lvii.

PARSINS, THEOPHILUS (1750–1813), American jurist, was born in Byfield, Massachusetts, on the 24th of February 1750, the son of a clergyman. He graduated from Harvard College in 1769, was a schoolmaster at Falmouth (now Portland), Maine, in 1770–1773, studied law, and was admitted to the bar in 1774. In 1800 he removed to Boston. He was chief justice of the supreme court of Massachusetts from 1806 until his death in Boston on the 30th of October 1813. In politics he took an active part as one of the Federalist leaders in the state. He was a member of the Essex County convention of 1778, called to protest against the proposed state constitution, and as a member of the “Essex Junto” was probably the author of The Essex
Result, which helped to secure the rejection of the constitution at the polls. He was a member of the state constitutional convention of 1779-1780, and one of the committee of twenty-six which drafted the constitution; he was also a delegate to the state convention of 1788 which ratified the Federal Constitution; and according to tradition was the author of the famous “Conciliatory Resolutions,” or proposed amendments to the constitution, which did much to win over Samuel Adams and John Hancock to the side of ratification. His Commentaries on the Laws of the United States (1836) contains some of his more important legal opinions.

His son Theophilus Parsons (1797-1852), who was Dane professor of law at Harvard from 1845 to 1870, is remembered chiefly as the author of a series of useful legal treatises, and some books in support of Swedenborgian doctrines; he wrote a life of his father (Boston, 1859).

PARSONS, a city of Labette county, in south-eastern Kansas, U.S.A., situated at the junction of the Big and Little Labette creeks, about 135 m. S. by W. of Kansas City. Pop. (1900), 7,682, of whom 807 were negroes; (1905), 11,720; (1910), 15,652. It is served by the Kansas City, Fort Scott & Memphis (St. Louis & San Francisco system) and the Missouri Kansas & Texas railways. The city has large machine shops of the Missouri Kansas & Texas railway and various manufactures. Natural gas is utilized for light and heat. The first settlement on the site of the city was made in 1869 and was called Mendota (“place of meeting”—i.e. of the creeks). In 1871 the city was chartered, and in 1910 government by commission went into effect. It was named in honour of Levi Parsons (1822-1887), the first president of the Missouri Kansas and Texas railway.

PARTABGARH, or PARTABGARH, a native state of India, in the Rajputana agency. Area, 886 sq. m.; pop. (1901), 52,025, showing a decrease of 40% in the decade, owing to the effects of famine. The inhabitants are mostly Bhils and other aboriginal tribes. Estimated revenue, £12,000. The town of Partabgarh (pop., 4,250) is connected by a macadamized road (20 m.) with the station of Mandasar on the Rajputana railway. It has a reputation for a special kind of enamelled jewelry.

PARTABGARH, or PARTAPGARH, a district of British India in the Fyzabad division of the United Provinces. The administrative headquarters are at Bela. Area, 1,442 sq. m.; pop. (1901), 912,848. The Ganges forms the south-western boundary line, while the Gunti marks the eastern boundary for a few miles. The only mineral products are salt, saltpetre and kankar or nodular limestone. The principal crops are rice, barley, pulse, millets, sugar-cane and poppy. The district is traversed by the branch of the Oudh & Rohilkhand railway from Rae Bareilly to Benares, opened in 1898. There are manufactures of sugar and a little silk; and grain, opium, oil-seeds, hemp and hides are exported.

See Partabgarh District Gazetteer (Allahabad, 1904).

Parker, a term, taken from the French phrase par terre, i.e. on the surface of the ground, and used in an arrangement in a garden of beds of flowers with gravel or other paths and plots of grass; it is the part of the auditorium of a theatre which is occupied by the orchestra.

PARNETHY, a town of western France, capital of an arrondissement in the department of Deux-Sèvres, 27 m. N.N.E. of Niort, on the railway between that town and Saumur. Pop. (1906), 5615. The town retains considerable portions of its fine 13th-century ramparts, including the Porte St Jacques, a fortified gateway guarding an old bridge over the Thouet. Amongst ancient buildings of interest are the church of St Croix, of the 12th century, restored in 1885, with a 15th-century belfry; the church of St Laurent, also restored in modern times, portions of whose walls date from the 11th century; the ruined Romanesque portal of Notre-Dame de la Coudre; and 1 m. south-west of the town the ancient church (12th century) of Parthenay-le-Vieux. The manufacture of woolen goods and wool-spinning are the principal local industries.

Parnethus, of Nicea in Bithynia, Greek grammarian and poet. He was taken prisoner in the Mithridatic War and carried to Rome (72 B.C.); subsequently he visited Neapolis, where he taught Virgil Greek. Parthenius was a writer of elegies, especially dirges, of short epic poems. The pseudo-Virgilian Morteum et Caris were imitated from his Morteum et Magyarophoros. His Épanôstalas katháriv is still extant, containing a collection of 36 love-stories which ended unhappily, taken from different historians and poets. As Parthenius generally quotes his authorities, these stories are valuable as affording information on the Alexandrian poets and grammarians.

See E. Martini in Mythographi graeci, vol. ii. (1902, in Teubner’s series); poetical fragments in A. Meineke, Analecta alexandrina (1853).

PARTHENON (Παρθενών), the name generally given, since the 4th century B.C., to the chief temple of Athena on the Acropolis at Athens (e.g. Demosthenes, c. Androt. 13, 76). The name is applied in the official inventories of the 5th and early 4th centuries to one compartment of the temple, and this was probably its original meaning. It is certainly to be associated with the cult of Athena Parthenos, “the Virgin,” though it is not clear why the name was given to this particular chamber.

The most convenient position for a temple upon the natural rock-platform of the Acropolis was occupied by the early temple of Athena. When it was decided to supersede this by a larger and more magnificent temple, it was necessary to provide a site for this new temple by means of a great substructure, which is on its south side about 40 ft. high. This substructure was not built for the present temple, but for an earlier one, which was later and narrower in shape; there has been much discussion as to the date of this earlier temple; F. C. Penrose maintained that it was the work of Peisistratus. Some have thought that it dated from the time immediately after the Persian wars; but the fact that portions of its columns and entablature, damaged by fire, were built into the north wall of the Acropolis by Themistocles seems to prove that it dates from the 6th century, whether it be the work of the tyrants or of the renewed democracy under Cleisthenes.

The extant temple was the chief among the buildings with which Pericles adorned the Acropolis. The supervision of the whole work was in the hands of Pheidias, and the architects of the temple were Ictinus and Callicrates. The actual building was begun in 447 B.C., though the decision to build was taken ten years earlier (Kell, Anonymus argentensis). The temple must have been structurally complete by the year 438 B.C., in which the gold and ivory statue of Athena Parthenos was dedicated; but the work of decoration and finish was still going on in 433 B.C. The temple as designed by Ictinus was about 15 ft. shorter and about 6 ft. wider than the building for which the foundations were intended; it thus obtained a proportion of length to breadth of exactly 9:4. It is the most perfect example of the Doric order (see Architecture: Greek). The plan of the temple was peculiar. The cela, which was exactly 100 ft. long, kept the name and traditional measurement of the old Hecatompedon. It was surrounded on three sides by a Doric colonnade, and in the middle of it was the great basis on which the statue was erected. This cela was probably lighted only by the great doorway and by the light that filtered through the marble tiles. The common notion that there was a hypaethral opening is
PARTHIA

erroneous. At the back of the cella was a square chamber, not communicating with it, but entered from the west end of the temple; this was the Parthenon in the narrower sense. It seems to have been used only as a store-house, though it may have been originally intended for a more important purpose. The Prodomus and the Ophiithodonum were enclosed by bronze gratings fixed between the columns, and were thus adapted to contain valuable offerings and other treasures. We have inventories on marble of the contents of these four compartments of the temple. The ophiithodonum, in particular, probably served as a treasury for sacred and other money, though it has been disputed whether the ophiithodonum mentioned in the inscriptions is part of the Parthenon or another building.

For the sculptures decorating the Parthenon and the statue in the cella, see article Greek Art. The metopes over the outer colonnade were all sculptured, and represented on the east the battle of gods and giants, on the west, probably, the battle of Greeks and Amazons, on the south Greeks and Centaurs; those on the north are almost lost. The east pediment represented the birth of Athena, the west pediment her contest with Poseidon for the land of Attica. The frieze, which was placed above the cella wall at the sides, represented the Panathenaic procession, approaching on three sides the group of gods seated in the pediment of the temple. These sculptures are all of them admirably adapted to their position on the building, and are, in themselves, the most perfect works that sculpture has ever produced.

The Parthenon probably remained intact until the 6th century of our era, when the colossal statue was removed, and the temple is said to have been transformed into a church dedicated to St. Sophia. In the 6th century it was dedicated to the Virgin Mother of God (Θεότοκος). The adaptation of the building as a church involved the removal of the inner columns and roof, the construction of an apse at the east end, and the opening of a door between the cella and the chamber behind it. These alterations involved some damage to the sculptures. In 1456 Athens was captured by the Turks, and the Parthenon was consequently changed into a mosque, apparently without any serious structural alterations except the addition of a minaret. In this state it was described by Spon and Wheler in 1676 and the sculpture was drawn by the French artist Carrey in 1674. In 1687 the Turks used the building as a magazine, and a detachment of the Acropolis by a Venetian army under Morosini, and a shell caused the explosion which blew out the middle of the temple and threw down the columns at the sides. Still further damage to the sculptures was done by Morosini’s unsuccessful attempt to lower from the west pediment the chariot of Athena. Later a small mosque was constructed in the midst of the ruins; but nothing except gradual damage is to be recorded during the succeeding century except the visits of various travellers, notably of James Stuart (1713–1788) and Nicholas Revett (1720–1804), whose splendid drawings are the best record of the sculpture as it existed in Athens. In 1801 Lord Elgin obtained a firman authorizing him to make casts and drawings, and to pull down extant buildings where necessary, and to remove sculpture from them. He caused all the remains of the sculpture to be found on the ground or in Turkish houses, and a certain amount—notably the metopes—that was still on the temple, to be transported to England. Some fault has been found with his methods or those of his workmen; but there is no doubt that the result was the preservation of much that would otherwise have been lost. The Elgin marbles were bought by the British government in 1816, and are now in the British Museum. Certain other sculptures from the Parthenon are in the Louvre, Copenhagen or elsewhere, and much is still in Athens, either still on the temple or in the Acropolis museum.

The most accurate measurements of the temple, showing the exactness of its construction and the subtility of the curvature of all its lines, was made by F. C. Penrose.

PARTHIA, the mountainous country S.E. of the Caspian Sea, which extends from the Elburz chain eastwards towards Herat, and is bounded on the N. by the fertile plain of Hyrcania (about Astrabad) at the foot of the mountains in the corner of the Caspian and by the Turanian desert; on the S. by the great salt desert of central Iran. It corresponds to the modern Khorasan. It was inhabited by an Iranian tribe, the Parthava, the inscriptions of Darius; the correct Greek form is Παρθαβία. Parthia became a province of the Achaemenian and then of the Macedonian Empire. Seleucus I. and Antiochus I. founded Greek towns: Soteira, Charis, Achaea, Calliope (Appian, Syr. 57; Plin. vi. 15; cf. Strabo xi. 356); the capital of Parthia is named only by its Greek name Hecatompylos ("The Hundreded") from the many roads which met there (Polyb. x. 29), and was, according to Appian, founded by Seleucus I. (cf. Curtius vii. 2). In 207 B.C. many Greek inhabitants are found in the towns of Parthia and Hyrcania (Polyb. x. 31, 11).

When about 255 B.C. Diodotus had made himself king of Bactria (q.v.) and tried to expand his dominions, the chieftain of a tribe of Iranian nomads (Dahan Scythi) east of the Caspian, the Parthi or Parni, who bore the Persian name Arsaces, fled before him into Parthia. Here the satrap Andragoras appears to have shaken off the Seleucid supremacy, as he struck gold and silver coins in his own name, on which he wears the diadem, although not the royal title (Gardner, Numism. Chronicle, 1879–1881). In Justin xii. 4, 12, Andragoras is wrongly made satrap of Alexander, of Persian origin, and ancestor of Arsaces. He was slain by Arsaces (Just. xii. 4), who occupied Parthia and became the founder of the Parthian kingdom. The date 248 B.C. given by the list of the Olympiads in Euseb. Chron. i. 207, and in his Canon, ii. 120 (cf. Appian, Syr. 65; Just. xii. 4, gives wrongly 256 B.C.), is confirmed by numerous Babylonian tablets dated simultaneously from the Seleucid and Arsacid eras (cf. Mahler, in Wiener Zeitschrift für die Kunde des Morgenlands, 1901, xv. 57 sq.; Lehmann, Haupt in Beiträge zur Altertumskunde, 1905, v. 128 sq.). Here Arsaces and his brother Tiridates are derived from the royal house of the Achaemenids, probably from Artaxerxes II.; the young Tiridates is insulted by the prefect Agathocles or Phareclus; in revenge the brothers with five companions (corresponding to the seven Persians of Darius) slay him, and Arsaces becomes king. He is killed after two years and succeeded by his brother Tiridates, who reigns 37 years. There is scarcely anything historical in this account, perhaps not even the name Tiridates, for, according to the older tradition, Arsaces himself ruled for many years. The troubles of the Seleucid empire, and the war of Seleucus II. against Ptolemy III., and his own brother Antiochus Hierax, enabled him now to maintain himself in Parthia, but also to conquer Hyrcania; but he was suddenly alarmed and threatened by Diodotus of Bactria (Just. xli. 4). When about 258 B.C., Seleucus II. was able to march into the east, Arsaces fled to the nomadic tribe of the Aspasiai (Strabo xi. 313; cf. Polyb. x. 43). But Seleucus was soon recalled by a rebellion in Syria, and Arsaces returned victorious to Parthia; "the day of this victory is celebrated by the Parthians as the beginning of their independence" (Just. xli. 4). Arsaces was proclaimed king at Assak in the district of Astaeuna, now Kuchan in the upper Atrek (Attruck) valley (Isidor. Charac.), and built his residence Dara on a rock in a fertile valley in Apavarktike (Just. xlii. 5; Plin. vi. 46), now Kelat still farther eastward; the centre of his power evidently lay on the borders of eastern Khorasan and the Turanian desert. The principal institutions of the Parthian kingdom

1 Strabo xi. 515; cf. Just. xli. 4; the Parthi are said by Strabo [ibid.] to have immigrated from southern Russia, a tradition wrongly transferred to the Parthians themselves by Just. xlii. 1, and Arrian, Ap. Phot. cod. 58.
were created by him (cf. Justin xii. 2). The Scythian nomads became the ruling race; they were invested with large landed property, and formed the council of the king, who appointed the successor. They were archers fighting on horseback, and in their cavalry consisted the strength of the Parthian army; the infantry were mostly slaves, bought and trained for military service, like the janissaries and mamelukes. But these Scyths soon amalgamated with the Parthian peasants. They adopted the Iranian religion of Zoroaster (in the royal town Asak an eternal fire was maintained), and “their language was a mixture of Scythian and Median” (i.e., Persian). Therefore their language and writing are called by the later Persians “Pehlevi,” i.e., Parthian (Pehlevi is the modern form of Parthava) and the magistrates themselves Pehlevans, i.e., “Parthians,” a term transferred by Firdousi to the heroes of the old Iranian legend. But the Arsacid kingdom never was a truly national state; with the Scythian and Parthian elements were united some elements of Greek civilization. The successors of Arsaces I. even founded some Greek towns, and when they had conquered Babylonia and Mesopotamia they all adopted the epithet “Philhellene.”

To Arsaces I. probably belong the earliest Parthian coins; the oldest they bear the name Arsaces; only a few, without doubt, explicitly struck after the coronation in Asak, have the royal title (šahānaub or šahān-spah). The reverse shows the seated archer, or occasionally an elephant; the head of the king is beardless and wears a helmet and a diadem; only from the third or fourth king they begin to wear a beard after the Persian fashion. In honour of the founder of the dynasty all his successors, when they came to the throne, adopted his name and officially (e.g. on the coins) are almost always called Arsaces, whereas the historians generally use their individual names.

The successors of Arsaces I. we know very little. His son, Arsaces II., was attacked by Antiochus III., the Great, in 209, who conquered the Parthian and Hyrcanian towns but at last granted a peace. The next king, whom Justin calls Prisapatus, ruled 15 years (about 190–175); his successor, Phraates I., subjected the mountainous tribe of the Mardi (in the Elburz). He died early, and was succeeded not by one of his sons but by his brother, Mithradates I., who became the founder of the Parthian empire. Mithradates I. (c. 170–158) had to fight hard with the Greeks of Bactria, especially with Eucratides (q.v.); at last he was able to conquer a great part of eastern Iran. Soon after the death of Antiochus IV. Epiphanes (163) he conquered Media, where he refounded the town of Khshagh (Kai near Teheran) under the name of Arasaca; and about 141 he invaded Babylonia. He and his son Phraates II. defeated the attempts of Demetrius II. (139) and Antiochus VII. (129) to regain the eastern provinces, and extended the Arsacid dominion to the Euphrates.

For the later history of the Parthian empire reference should be made to Persia: Ancient History, and biographical articles on the kings. The following is a list of the kings, as far as it is possible to establish their succession.

The names of pretenders not generally acknowledged are put in brackets.

| Arsaces I. | 248–221 |

AUTHORITIES.—Persian tradition knows very little about the Parthians, of whom it is by far the most accurate the modern form of Arsaces. Of modern works on the history of the Parthians the most important are: G. Rawlinson, *The Sixth Oriental Monarchy* (1873), and A. von Gutschmid, *Geschichte Iran und seiner Nachbarländer von Alexander d. Gr. bis zum Untergang der Arsaciden* (1888).

The principal works on the Arsacid coinage are (after the earlier publications of Longpré, Proksch-Ostian, &c.): Percy Gardner, *The Parthian Coinage* (London, 1877), and especially W. W. Wroth, *Catalogue of the Coins of Parthia in the British Museum* (London, 1893), which revised the statements of his predecessors. See also Petrowicz, *Arsacidennamen* (Vienna, 1904), and Allotte de la Fuye, *Classement des monnaies arsacides,* *Revue numismatique*, 4 serie, vol. viii., 1904.

PARTICULARS, or Partition. (1) A thoroughlygoing “party” man or adventurer, usually in a depreciatory sense of one who puts his party before principles; (2) an irregular combatant or guerrilla soldier; (3) a weapon with a long shaft and a broad bladed head, of a type intermediate between the spear and the halberd (q.v.). In senses (1) and (2) the word is derived from the Fr. from It. partigiano, from parteggiare, to share, take part in, Lat. pars, part. The name for the weapon has also been attributed to the same origin, as being that used by “partisans,” but there is no historical evidence for this. The form which the word now takes in French, partisane, has given rise to a connexion with partis, hole; Lat. partius, pertundere, to strike through. But the most probable derivation is from the Teutonic parta, bata, axe, which forms the last part of “halberd.”

PARTITION, in law, the division between several persons of land or goods belonging to them as co-proprietors. It was a maxim of Roman law, followed in modern systems, that "in comminutione vel societate nemo potest titulus deliberari." Partition was either voluntary or was obtained by the actio communi dividendo. In English law the term partition applies only to the division of lands, tenements, and hereditaments, or of chattels real between coparceners, joint tenants or tenants in common. It is to be noticed that not all hereditaments are capable of partition. There can be no partition of homage, fealty, or common of turbary, or of an inheritance of dignity, such as a peerage. Partition is either voluntary or compulsory. Voluntary partition is effected by mutual conveyances, and can only be made where all parties are sui juris. Since the Real Property Act 1845, § 3, it must be made by deed, except in the case of copyholds. Compulsory partition is effected by private act of parliament, by judicial process, or through the inclosure commissioners. At common law none but coparceners were entitled to partition against the will of the rest of the proprietors, but the Acts of 31 Henry VIII. c. 2 and 32 Henry VIII. c. 32 gave a compulsory process to joint tenants and tenants in common of
PARTNERSHIP

freeholds, whether in possession or in reversion, by means of the writ of partition. In the reign of Elizabeth the court of chancery began to assume jurisdiction in partition, and the writ of partition, after gradually becoming obsolete, was finally abolished by the Real Property Limitation Act 1833. The court of chancery could not decree partition of copyholds until the passing of the Copyhold Act 1841. This act was repealed by the Copyhold Act 1894, which empowers the alienation of ancient tenements with the licence of the lord. By the Judicature Act 1873, § 34, partition is one of the matters specially assigned to the chancery division. An order for partition is a matter of right, subject to the discretion vested in the court by the Partition Act 1868 (amended by the Partition Act 1876). By § 3 of the act of 1868 the court may, on the request of a party interested, direct a sale instead of a partition, if a sale would be more beneficial than a partition. By § 12 a county court has jurisdiction in partition where the property does not exceed £500 in value. Under the provisions of the Inclosure Act 1845, and the acts amending it, inclosure commissioners have power of enforcing compulsory partition among the joint owners of any inclosed lands. An order of the inclosure commissioners or a private act vests the legal estate, as did also the old writ of partition. But an order of the chancery division only declares the rights, and requires to be perfected by mutual conveyances so as to pass the legal estate. Where, however, all the parties are sui juris, the court may make a vesting order under the powers of the Trustee Act 1859, § 30.

Partition is not a technical term of Scots law. In Scotland division of common property is effected either extra-judicially, or by action of declarator and division, and in public or private breach of contract. In the Court of Session, a statute of 1653, c. 23, made all commoners, except those belonging to the king or royal burghs, divisible, on the application of any having interest, by action in the court of session. By the Sheriff Courts (Scotland) Act 1877, § 8, the action for division of common property is provided for, and the sheriff, or his commissioners, have exclusive jurisdiction. As between heirs and devisees the probate courts may in some states award partition. The various state laws with regard to partition will be found in Washburn, Real Property, ch. xii., § 7.

PARTNERSHIP (earlier forms, partener, parcener, from Late Lat. partitarius for partitionarius, from partition, sharing, pars, part), in general, the voluntary association of two or more persons for the purpose of gain, or sharing in the work and profits of any enterprise. This general definition, however, requires to be further restricted, in law, according to the account given below.

The partnership of modern legal systems is based upon the socitatis of Roman law. Societas was either universorium bonorum, a complete communion of property; negotiationis alicujus, for the purpose of a single transaction; vectigalis, for the collection of taxes; or rei unius, joint ownership of a particular thing. The prevailing form was societas universorium quae ex quaeve veniunt, or trade partnership, from which all that did not come under the head of trade profit (quaevea) was excluded. This form was generally impressed in the absence of proof that any other kind was intended. The partnership was a consensual contract, and rested nominally on the consent of the parties—really, no doubt (though this was not in terms acknowledged by the Roman jurists), on the fact of valuable consideration moving from each partner. No formalities were necessary for the constitution of a societas. Either property or labour must be contributed by the socius; if one party contributed neither property nor labour, or if one partner was to share in the loss but none in the profit (lemovia societas), there was no true societas. Societas was dissolved on grounds substantially the same as those of English law (see below). The only ground peculiar to Roman law was change of status (capitis deminutio). Most of the Roman law on the subject of societas is contained in Dig. xvi. tit. 2, Pro socio.

Though the English law of partnership is based upon Roman law, there are several matters in which the two systems differ. (1) There was no limit to the number of partners in Roman law. (2) In societas one partner could generally bind another only by express mandatum; one partner was not regarded as the implied agent of the others. (3) The debts of a societas were apparently joint, and not joint and several. (4) The heres of a deceased partner could not succeed to the rights of the deceased, even by express stipulation. There is no such disability in England. (5) In actions between partners in Roman law, the beneficium comprehendit applied—that is, the privilege of being condemned only in such an amount as the partner could pay without being reduced to destitution. (6) The Roman partner was in some respects more strictly bound by his fiduciary position than is the English partner. For instance, a Roman partner could not retire in order to enjoy alone a gain which he knew was awaiting him. (7) There was no special tribunal to which matters arising out of societas were referred.

Previous to the Partnership Act 1890 the English law of partnership was to be found only in legal decisions and in textbooks. It was mostly the result of judge-made law, and as distinguished from the law of joint stock companies was affected by comparatively few acts of parliament.

In 1890 the Partnership Act of that year was passed to declare and amend the law of partnership; the act came into operation on 1 January 1891. With one important exception (§ 23), it applies to the whole United Kingdom. It is not a complete code of partnership law; it contains no provisions regulating the administration of partnership assets in the event of death or bankruptcy, and is silent on the subject of goodwill. The existing rules of equity and common law continue in force, except so far as they are inconsistent with the express provisions of the act. Indeed, the act of 1890 has to be read in the light of the decisions which have built up these rules. On all points specifically dealt with by the act it is now the one binding authority. The act has made no important changes in the law, except in respect of the mode of making a partner's share of the partnership assets available for payment of his separate debts. This change does not affect Scotland. The act is divided into the four main divisions mentioned below.

I. Nature of Partnership.—Partnership is defined to be the "relation which subsists between persons carrying on a business in common with a view of profit." From this definition corporations and companies, such as joint-stock companies and cost-book mining companies, which differ from ordinary partnerships in many important respects, are expressly excluded. The act also contains several subsidiary rules for determining the existence of a partnership. These rules are of a fragmentary nature, and for the most part are expressed in a negative form; they have not introduced any change in the law. Co-ownership of property does not of itself create a partnership, nor does the sharing of gross returns. The sharing of profits, though not of itself sufficient to create a partnership, is prima facie evidence of one. This means that if all that is known is that two persons are sharing profits, the inference is that such persons are partners; but if the participation in profits is only one amongst other circumstances, all the circumstances must be considered, and the participation in profits must not be treated as raising a presumption of partnership, which has to be rebutted. To illustrate the rule that persons may share profits without being partners, the act gives statutory expression to the decision in Cox v. Hickman (1860, 8 H.L.C., 268), viz. that the receipt
by a person of a debt or other fixed sum by instamts, or otherwise, out of the accruing profits of a business does not of itself make him a partner; and it re-enacts with some slight modification the repealed provisions of Bovill's Act (28 & 29 Vict. c. 86), which was passed to remove certain difficulties arising from the decision in Cox v. Hickman. Whenever the question of partnership or no partnership arises, it must not be forgotten (though this is not stated in the act) that partnership is a relation arising out of a contract; regard must be paid to the true contract and intention of the parties as appearing from the whole facts of the case. If a partnership be the legal consequence of the true agreement, the parties thereto will be partners, though they may have intended to avoid this consequence (Adam v. Newbigging, 1888, L.R. 13 App. Cas. 315). Partners are called collectively a "firm"; the name under which they carry on business is called the firm name. Under English law the firm is not a corporation, nor is it recognized as distinct from the members composing it; any change amongst them destroys the identity of the firm. In Scotland a firm is a legal person distinct from its members, but each partner can be compelled to contribute to the debt and not be responsible beyond his share.

A firm is also liable to the extent of the capital of each partner, and by the Companies Act 1862 (25 & 26 Vict. c. 89, § 4), not more than ten persons can carry on the business of bankers, and not more than twenty any other business, unless (with some exceptions) they conform to the provisions of the act. (See COMPANY, and also Limited Partnerships below.)

II. Relations of Partners to Persons dealing with them.—Every partner is an agent of the firm and of his co-partners for the purpose of the partnership business; if a partner does an act for carrying on the partnership business in the usual way in which businesses of a like kind are carried on—in other words, if he acts within his apparent authority—he thereby prima facie binds his firm. The partners may by agreement between themselves restrict the power of any of their number to bind the firm. If there be such an agreement, no act done in contravention of it is binding on the firm with respect to persons who have notice of the agreement. Such an agreement does not affect persons who have no notice of it, unless indeed they do not know or believe the person with whom they are dealing to be a partner; in that case he has neither real, nor, so far as they are concerned, apparent authority to bind the firm, and his firm will not be bound. If a partner does an act, e.g. pledges the credit of the firm, for a purpose apparently not connected with the firm's ordinary course of business, he is not acting in pursuance of his apparent authority, and whatever liability he may personally incur, his partners will not be bound unless he had in fact authority from them.

Apart from any general rule of law relating to the execution of deeds or negotiable instruments, a firm and all the partners will be bound by any act relating to the business of the firm, and done in the firm name, or in any other manner showing an intention to bind the firm, by any person thereto authorized. An admission or representation by a partner, acting within his apparent authority, is evidence against his firm. Notice to an acting partner of any matter relating to the partnership affairs is, apart from fraud, not to bind the firm or the co-partners, unless their consent be given, and it is not sufficient, in order to fix innocent partners with liability for the misappropriation of money belonging to a third party, merely to show that such money was employed in the business of the partnership, otherwise all the members of a firm would in all cases be liable to those beneficially interested therein for trust money improvidently employed in this manner by one partner. This is not the case. To fix the other partners with liability, notice of the breach of trust must be brought home to them individually.

The liability of partners for the debts and obligations of their firm arising ex contractu, is joint, and in Scotland several also; the estate of a deceased partner is also severally liable in a due course of administration, but subject, in England or Ireland, to the prior payment of his separate debt. The liability of partners for the obligations of their firm arising ex delicto, is joint and several.

The authority of a partner to bind his co-partners commences with the partnership. A person therefore who enters into a partnership does not thereby become liable to the creditors of his partners for anything done before he became a partner. But a partner who retires from a firm does not thereby cease to be liable for debts or obligations incurred before his retirement. He may be discharged from existing liabilities by an agreement to that effect between himself and the members of the firm as newly constituted and the creditors. This agreement may be either express or inferred as a fact from the course of dealing between the creditors and the new firm. The other ways in which a partner may be freed from partnership liabilities incurred before his retirement are not peculiar to partnership liabilities, and are not therefore dealt with by the Partnership Act.

A continuing guaranty given to a firm, or in respect of the transactions of a firm, is, in the absence of agreement to the contrary, revoked as to the future by a change in the firm. The reason is that such a change destroys its identity.

Any person, not a partner in the firm, who represents himself (or, as the phrase is, "holds himself out"), or knowingly suffers himself to be represented, as a partner, is liable as a partner to any person who has given credit to the firm on the faith of the representation. The representation may be by words spoken or written, or by conduct. The liability will attach, although the person who makes the representation does not know that the person who has acted on it knew of it.

The continued use of a deceased partner's name does not impose liability on his estate.

III. Relations of Partners to one another.—The mutual rights and duties of partners depend upon the agreement between them. Many of these rights and duties are stated in the Partnership Act; but, whether stated in the act or ascertained by agreement, they may be varied by the consent of all the partners; such consent may be express or inferred from conduct. Subject to any agreement, partners share equally in the capital and profits of their business, and must contribute equally to losses, whether of capital or otherwise; they are entitled to be indemnified by their firm against liabilities incurred in the proper and ordinary conduct of the partnership business, and for anything necessarily done for its preservation; they are entitled to interest at 5% on their advances to the firm, but not on their capital. Every partner may take part in the management of the partnership business, but no partner is entitled to remuneration for so doing. The majority can bind the minority in ordinary matters connected with the partnership business, but cannot change its nature nor expel a partner, unless expressly authorized to do so. No partner may be introduced into the firm without the consent of all the partners. The partnership books must be kept at the principal place of business, and every partner may inspect and copy them. Partners must render to each other true accounts and full information of all things affecting the partnership. A partner may not make use of anything belonging to his firm for his private purposes, nor may he compete with it in business. If he does so he must account to his firm for any profit he may make.

Partners may agree what shall and what shall not be partnership property, and can by agreement convert partnership property into the separate property of the individual partners, and vice versa. Subject to any such agreement, all property originally brought into the partnership stock, or acquired on
PARTNERSHIP

account of the firm or for the purposes and in the course of its business, is declared by the act to be partnership property. Property bought with money of the firm is prima facie bought on account of the firm. Partnership property must be applied exclusively for partnership purposes and in accordance with the partnership agreement. Co-owners of land may be partners in the profits of the land without the land being partnership property; if such co-owners purchase other lands out of the profits, these lands will also belong to them (in the absence of any agreement to the contrary) as co-owners and not as partners. The legal estate in partnership land devolves according to the general law, but in trust for the persons beneficially interested therein. As between partners, and as between the heirs of a deceased partner and his executors or administrators, such land is treated as personal or movable estate, unless a contrary intention appears.

When no fixed term has been agreed upon for the duration of the partnership, it is at will, and may be determined by notice at any time by any partner. If a partnership for a fixed term is continued after the term has expired without any express new agreement, the rights and duties of the partners remain as before, so far as they are consistent with a partnership at will.

A partner may assign his share in the partnership either absolutely or by way of mortgage. The assignee does not become a partner; during the continuance of the partnership he has the right to receive the share of profits to which his assignor would have been entitled, but he has no right to interfere in the partnership business, or to require any accounts of the partnership transactions, or to inspect the partnership books. On a dissolution he is entitled to receive the share of the partnership assets to which his assignor is entitled as between himself and his partners, and for this purpose to an account as from the date of dissolution.

Since the act came into operation no writ of execution may issue in England or Ireland against any partnership property, except on a judgment against the firm. If in either of these countries a judgment creditor of a partner wishes to enforce his judgment against that partner's share in the partnership, he must obtain an order of court charging such share with payment of his debt and interest. The court may appoint a receiver of the partner's share, and may order a sale of such share. If a sale be ordered the other partners may buy the share; they may also at any time redeem the charge. The mode of making a partner's share liable for his separate debts in Scotland has not been altered by the act.

IV. Dissolution of Partnership.—A partnership for a fixed term, or for a single adventure, is dissolved by the expiration of the term or the termination of the adventure. A partnership for an undefined time is dissolved by notice of dissolution, which may be given at any time by any partner. The death or bankruptcy of any partner dissolves the partnership as between all its members. If a partner suffers his share in the partnership to be charged under the act for his separate debts, his partners may dissolve the partnership. The foregoing rules are subject to any agreement there may be between the partners. A partnership is in every case dissolved by any event which may bring the partnership or its business unlawful. The court may order a dissolution in any of the following cases, viz.: When a partner is found lunatic or is of permanently unsound mind, or otherwise permanently incapable of performing his duties as a partner; when a partner has been guilty of conduct calculated to injure the partnership business, or wilfully or persistently breaks the partnership agreement, or so conducts himself in partnership matters that it is not reasonably practicable for his partners to carry on business with him; when the partnership can only be carried on at a loss; and lastly, whenever a dissolution appears to the court to be just and equitable. The act is silent as to the effect of the assignment by a partner of his share in the partnership as a cause of dissolution; probably it is now no more than a circumstance enabling the court, if it thinks fit, to grant a dissolution on the ground that it is just and equitable to do so. A dissolution usually is not complete as against persons who are not partners, until notice of it has been given; until then such persons may treat all apparent partners as still members of the firm. Consequently, if notice is not given when it is necessary, a partner may be made liable for partnership debts contracted after he ceased to be a partner. Notice is not necessary to protect the estate of a dead or bankrupt partner from partnership debts contracted after his death or bankruptcy: nor is notice necessary when a person not known to be a partner leaves a firm. If a person not generally known to be a partner is known to be so to certain individuals, notice must be given to them. Notice in the Gazette is sufficient as regards all persons who were not previously customers of the firm; notice in fact must be given to old customers. On a dissolution, or the retirement of a partner, any partner may notify the fact and require his co-partners to concur in doing so.

After a dissolution, the authority of each partner (unless he be a bankrupt) to bind the firm, and the other rights and obligations of the partners, continue so far as may be necessary to wind up the partnership affairs and to complete unfinished transactions. The partners are entitled to have the partnership property applied in payment of the debts of the firm, and to have any surplus divided between them. Before a partner can receive any part of the surplus, he must make good whatever may be due from him as a partner to the firm. To enforce these rights, any partner or his representatives may apply to the court to wind up the partnership business. It was well established before the act, and is still law, that in the absence of special agreement the right of each partner is to have the partnership property—including the goodwill of its business, if it be saleable—realized by a sale. The value of the goodwill depends largely on the right of the seller to compete with the purchaser after the sale. The act makes no mention of goodwill, but the rights of a seller in this respect were fully discussed in the House of Lords in Trego v. Hunt (L.R. 1806, App. Cas. 7). In the absence of special agreement, the seller may set up business in competition with, and in the immediate neighbourhood of, the purchaser, and advertise his business and deal with his former customers, but may not represent himself as carrying on his former business, nor carry on his former customers. The purchaser may advertise himself as carrying on the former business, canvass its customers, and trade under the old name, unless that name is or contains the name of the vendor, and the purchaser by using it without qualification would expose the vendor to the liability of being sued as a partner in the business. If, on a dissolution or change in the constitution of a firm, the goodwill belongs under the partnership agreement exclusively to one or more of the partners, the partner who is entitled to the goodwill has the rights of a seller, and those to whom the goodwill does not belong have the rights of a purchaser.

When a partner has paid a premium on entering into a partnership for a fixed term, and the partnership is determined before the expiration of the term, the court may, except in certain cases, order a return of the premium or of some part of it. In the absence of fraud or misrepresentation, the court cannot make such an order when the partnership was at will, or, being for a fixed term, has been terminated by death or by reason of the misconduct of the partner who paid the premium; nor can it do so if terms of dissolution have been agreed upon, and the agreement makes no provision for the return of premium.

When a person is induced by the fraud or misrepresentation of others to become a partner with them, the court will rescind the contract at his instance (Adam v. Newbigging, 1888, R. 13 App. Cas. 308). Inasmuch as such a person is under the same liability to third parties for liabilities of the firm incurred before rescission as he would have been under had the contract been valid, he is entitled on the rescission to be indemnified by the person guilty of the fraud or making the representation against these liabilities. He is also entitled, without prejudice
to any other rights, to receive out of the surplus assets of the partnership, after satisfying the partnership liabilities, any money he may have paid as a premium or contributed as capital, and to stand in the place of the creditors of the firm for any payments made by him in respect of the partnership liabilities.

If a partner ceases to be a member of a firm, and his former partners continue to carry on business with the partnership assets without any final settlement of accounts, he, or, if he be dead, his estate, is, in the absence of agreement, entitled to such part of the subsequent profits as can be attributed to the use of his share of the partnership assets, or, if he or his representatives prefer it, to interest at 5% on the amount of his share. If his former partners have by agreement an option to purchase his share, and exercise the option and comply with its terms, he is not entitled to any further or other share in profits than that given him by the agreement. If, however, his former partners, assuming to exercise such an option, do not comply with its terms, they are liable to account for subsequent profits or interest to the extent mentioned above. Subject to any agreement between the partners, the amount due from the surviving or continuing partners to an outgoing partner, or the representatives of a deceased partner, in respect of his share in the partnership, is a debt accruing at the date of the dissolution or death.

In the absence of any special agreement on a final settlement of accounts between partners, losses (including losses of capital) are paid first out of profits, next out of capital, and lastly by the partners in the proportions in which they share profits. The assets of the firm, including all sums contributed to make up losses of capital, are applied in paying the debts and liabilities of the firm to persons who are not partners; then in paying to each partner rateably what is due from the firm to him, first for advances and next in respect of capital; and the ultimate residue (if any) is divisible among the partners in the proportion in which their interests are divisible.

**Limited Partnerships.** In the law of partnership as set out above, the Limited Partnership Act 1907 introduced a considerable innovation. By that act power was given to form limited partnerships, like the French société en commandite—that is, a partnership consisting not only of general partners, but of others whose liability is limited to the amount contributed to the concern. Such a limited partnership must not consist, in the case of a partnership carrying on the business of banking, of more than ten persons, and in the case of any other partnership of more than twenty persons. There must be one or more persons called general partners who are liable for all the debts and obligations of the firm, and limited partners, who on entering into partnership contribute a certain sum or property valued at a stated amount, beyond which they are not liable. Limited partners cannot withdraw or receive back any of their contributions; any withdrawal brings liability for the debts and obligations of the firm up to the amount withdrawn. A body corporate may be a limited partner. No limited partner can take part in the management of a partnership business; if he does so he becomes liable in the same way as a general partner, but he can at all times inspect the books of the firm and examine into the state and prospects of the business. Every limited partnership must be registered with the registrar of joint stock companies, and the following particulars must be given: (a) the firm name; (b) the general nature of the business; (c) the principal place of business; (d) the full name of each of the partners; (e) the term, if any, for which the partnership is entered into and the date of its commencement; (f) a statement that the partnership is limited, and the description of every limited partner as such; (g) the sum contributed by each limited partner, and whether paid in cash or how otherwise. If any change occurs in these particulars, a statement signed by the firm and specifying the nature of the change, must be sent within seven days to the registrar. An advertisement must also be inserted in the gazette of any arrangement by which a general partner becomes a limited partner or under which the share of a limited partner is assigned. Any person making a false return for the purpose of registration commits a misdemeanour and is liable to imprisonment with hard labour for a term not exceeding two years. The law of private partnership applies to limited partners except where it is inconsistent with the express provisions of the Limited Partnership Act.

**Scots Law.**—The law of Scotland as to partnership agrees in the main with the law of England. The principal difference is that Scots law recognizes the firm as an entity distinct from the individuals composing it. The firm of the company is either proper or descriptive. A proper or personal firm is a name or designation by the name of one or more of the partners. A descriptive firm does not introduce the name of any of the partners. The former may sue and be sued under the company name; the latter only with the addition of the names of three at least (if there are so many) of the partners. A consequence of this view of the company as a separate person is that an action cannot be maintained against a partner personally without application to the company in the first instance, the individual partners being in the position of cautioners for the company rather than of principal debtors. The provisions of the Mercantile Law Amendment Act 1856 (19 & 20 Vict. c. 60, § 8), do not affect the case of partners. But, though the company must first be discussed, diligence must necessarily be directed against the individual partners. Heritable property cannot be held in the name of a firm; it can only stand in the name of individual partners. Notice of the retirement of even a dormant partner is necessary. The law of Scotland draws a distinction between joint adventure and partnership. Joint adventure or joint trade is a partnership confined to a particular adventure or speculation, in which the partners, whether latent or unknown, use no firm or social name, and incur no responsibility beyond the limits of the adventure. In the rules applicable to cases of insolvency and bankruptcy of a company and partners, Scots law differs in several respects from English. Thus a company can be made bankrupt without the partners being made so as individuals. And, when both company and partners are bankrupt, the company creditors are entitled to rank on the separate estates of the partners for the balance of their debts equally with the separate creditors. But in sequestration, by the Bankruptcy Act 1856, § 66, the creditor of a company, in claiming upon the sequestrated estate of a partner, must deduct from the amount of his claim the value of his rights to draw payment from the company's funds, and he is ranked as creditor only for the balance. (See Erskine's *Inst. tit. iii. Bell's Comm. ii. 500–562; Bell's Principles, §§ 350–403.)

**United States.**—In the United States the English common law is the basis of the law. Most states have, however, their own special legislation on the subject. The law in the United States permits the existence of limited partnerships, corresponding to the sociétés en commandite established in France by the ordinance of 1673, and those legalized in England under the act of 1907 (see above). The State of New York was the first to introduce this kind of partnership by legislative enactment. The provisions of the New York Act have been followed by most of the other states. In many states there can be no limited partnerships in banking and insurance. In this form of partnership one or more persons responsible in solido are associated with one or more dormant partners liable only to the extent of the funds supplied by them. In Louisiana such partnerships are called partnerships in commandment (Civil Code, art. 2810).

1 In France, it is to be noted, the style of a firm must contain no names other than those of actual partners. In Germany it is provided, upon the first constitution of the firm, contain the name of at least one actual partner, and must not contain the name of any one who is not a partner; when once established the style of the firm may be continued notwithstanding changes.
In New York the responsible partners are called general partners, the others special partners. Such partnerships must, by the law of most states, be registered. In Louisiana universal partnerships (the sociétés uninominales honorum of Roman law) must be created in writing and registered (Civil Code, art. 2500).

In some states the English law as it stood before Cox v. Hickman is followed, and participation in profits is still regarded as the test of partnership, e.g. Leggett v. Hyde (58 New York Rep. 272). In some states nominal partners are not allowed. Thus in New York, where the words "and Company" or "and Co." are used, they must represent an actual partner or partners. A breach of this rule subjects offenders to penalties. In most states claims against the firm after the death of a partner must, in the first instance, be made to the survivors. The creditors cannot, as in England, proceed directly against the representatives of the deceased. An ordinary partnership between miners for working a mine is not dissolved by the death of one of the partners, nor by the transfer by one of his interest in the concern. Contract is not deemed the basis of the relation between the partners, but rather a common property and co-operation in its exploitation (Parsons, Principles of Partnership, § 15). A corporation cannot become a partner in any mercantile adventure, unless specially authorized by the law, and then only for a limited statute period. After that, its affairs would no longer be exclusively in the hands of its directors, to whom the law has entrusted it. Hence, corporations cannot associate for the formation of a "trust" to be managed by the associated partners.

PARTON, JAMES (1822–1891), American biographer, was born in Canterbury, England, on the 9th of February 1822. He was sent to the United States when he was five years old, studied in New York City and White Plains, New York, and was a schoolmaster in Philadelphia and then in New York. He removed (1875) to Newburyport, Massachusetts, where he died on the 17th of October 1891. Parton was the most popular biographer of his day in America. His most important books are Life of Horace Greely (1855), Life and Times of Aaron Burr (1857), Life of Andrew Jackson (1859–1860), Life and Times of Benjamin Franklin (1864), Life of Thomas Jefferson (1874), and Life of Voltaire (1871). Among his other publications are The story of the United States (1863) and Washington and the border states (1864). A few of his poems are: "Leeds and the Border Counties," "The Remains of Captain John Smith," and "The Poet's Dream." His last important work was the "Dictionary of Authors." He was a man of scholar and artist, and his books are full of learning and beauty. He was a great admirer of the English school of biography and had a strong influence on the development of the American school of biography.

PARTRIDGE, WILLIAM ORWAY (1861–1932), American sculptor, was born at Paris, France, on the 11th of April 1861. He received his training as a sculptor in Florence (under Galli), in Rome (under Weisinski), and in Paris. He became a lecturer and writer, chiefly on art subjects, and from 1894 to 1897 was professor of fine arts in Columbus University (now the George Washington University), Washington, D.C. Among his publications are: Art for America (1894), The Song of Life (1895), The Angel of Clay (1900), and The Ideal Patriot (1903). His sculptural works consist largely of portraiture.
nearly as much to its legs as to its wings, and thus incurred the obloquy of old-fashioned sportsmen, whose dogs it vexatiously kept at bay; but, when it was also accused of driving away the grey partridge, the charge only showed the ignorance of those who brought it, for as a matter of fact the French partridge rather prefers ground which the common species avoids—such as the heaviest clay-soils or the most infertile heaths. The French partridge has several congeners, all with red legs and plumage of similar character. In Africa north of the Atlas there is the Barbary partridge, C. petrosa; in Southern Europe another, C. saxatilis, which extends eastward till it is replaced by C. chukar, which reaches India, where it is a well-known bird. Two very interesting desert-forms, supposed to be allied to Caccobis, are the Ammoperdix heyi of North Africa and Palestine and the A. bonhami of Persia; but the absence of the metatarsal knob, or incipient spur, suggests (in our ignorance of their other osteological characters) an alliance rather to the genus Perdix. On the other hand the group of birds known as Francolins and Snow-Partridges are generally furnished with strong but blunt spurs, and therefore probably belong to the Caccobine group. Of the former, containing many species, there is only room here to mention the francolin, which used to be found in many parts of the south of Europe, Francolinus vulgaris, which also extends to India, where it is known as the black partridge. This seems to have been the Aitasas or Aitagen of classical authors, a bird so celebrated for its exquisite flavour, the strange disappearance of which from all or nearly all its European haunts still remains inexplicable. It is possible that this bird has been gradually vanishing for several centuries, and if so to this cause may be attributed the great uncertainty attending the determination of the Aitasas—it being a common practice among men in all countries to apply the name of a species that is growing rare to some other that is still abundant. Of the snow-partridges, Tetrao, is it to be said here that they are the giants of their kin, and that nearly every considerable range of mountains in Asia seems to possess its specific form.

By English colonists the name Partridge has been very loosely applied, and especially so in North America. Where a qualifying word is prefixed no confusion is caused, but without it there is sometimes a difficulty at first to know whether the Ruffed Grouse (Bonasa umbellus) or the Virginia Quail (Ortyx virginianus) is meant. In South America the name is given to various Tinamous (q.v.).

PARTY WALL, a building term which, in England, apart from special statutory definitions, may be used in four different legal senses (Watson v. Gray, 1889, 14 Ch. D. 192). It may mean (1) a wall of which the adjoining owners are tenants in common; (2) a wall divided longitudinally into two strips, one belonging to each of the neighbouring owners; (3) a wall which belongs entirely to one of the adjoining owners, but is subject to an easement or right in the other to have it maintained as a dividing wall between the two tenements; (4) a wall divided longitudinally into two moieties, each moiety being subject to a cross easement, in favour of the owner of the other moiety. Outside London the rights and liabilities of adjoining owners of party walls are subject to the rules of common law. In London they are governed by the London Building Act 1894. A tenant in common of a party wall is entitled to have a partition vertically and longitudinally, so as to hold separately (Mayfair Property Co. v. Johnston, 1894, 1 Ch. 598); each owner can then use only his own part of the wall. By the London Building Act 1894, § 5 (10) the expression "party wall" means—(a) a wall forming part of a building and used or constructed to be used for separation of adjoining buildings belonging to different owners, or occupied or constructed or intended to be occupied by different persons; or (b) a wall forming part of a building, and standing to a greater extent than the projection of the footings on land of different owners. Section 87 regulates the rights of owners of adjoining lands to erect party walls on the line of junction. Sections 88-90 determine the rights of building to deal with party walls by underpinning, repairing or rebuilding. The act also contains provisions for settling disputes (§§ 91-92), and for bearing and recovering expenses (§§ 95-102). Part VI. of the act regulates the structure and thickness, height, &c., of party walls.

See A. R. Rudall, Party Walls (1907).

PARUTA, PAOLO (1544-1598), Venetian historian. After studying at Padua he served the Venetian republic in various political capacities, including that of secretary to one of the ambassadors at the Congress at Trent. In 1579 he published a work entitled Della Perfezione della vita politica, and the same year he was appointed official historian to the republic, in succession to Luigi Contarini. He took up the narrative from where Cardinal Bembo had left it, in 1513, and brought it down to 1551. He was made provveditore to the Chamber of Loans in 1580, savio del gran consiglio in 1590, and governor of Brescia in the following year. In 1596 he was appointed provveditore of St Mark, and in 1597 superintendent of fortifications. He died a year later. His history, which was at first written in Latin and subsequently in Italian, was not published until after his death—in 1599. Among his other works may be mentioned a history of the War of Cyprus (1579-72), and a number of political orations.

See Apostolo Zeno's edition of Paruta's history in the series Digii Istorici delle cose veneziane, Venice, 1718, and C. Monzani's edition of Paruta's political works (Florence, 1852).

PARRY, John (q.v.), born in 1767, died in 1809. He was the first to reach the North Pole. Parry was the son of Dr. John Parry, the distinguished zoologist, and was educated at Eton, and at the University of Edinburgh.

PARRY, PARVISE, or PARVYSE, an open space surrounded by an enceinte or stone parapet in front of buildings, particularly cathedrals or large churches; probably first used to keep the people from pressing on and confusing the marshaling of processions. The word "parvis" is French and is a corruption of Lat. parvisus, an enclosed garden or paradise (q.v.), which is sometimes also used instead of "parvis." The Lat. parvisus is defined by Du Cange (Glossarium, s.v.) as arium porticus circumdatum ante aedes sacras. At St. Paul's in London the "parvis" was a place where lawyers met for consultation.

PARYSATIS, daughter of Artaxerxes I., married to her brother Ochus (Ctesias, Pers. 44), who in 424 B.C. became king of Persia under the name of Darius II. (q.v.). She had great influence over her husband, whom she helped by perfidy in the suppression of his brothers Secydianus, who was king before him, and Aristeus, who rebelled against him (Ctes. Pers. 48-51). Her favourite son was Cyrus the Younger, whom she assisted as far as possible in his attempt to gain the throne. But when he was slain at Cunaxa (401) she nevertheless gained absolute dominion over the victorious Artaxerxes II. She was the evil genius of his reign. By a series of intrigues she was able to inflict the most atrocious punishment on all those who had taken part in the death of Cyrus. (Ed. M.)

PASADENA, a city in the San Gabriel valley of Los Angeles county, in southern California, U.S.A., about 9 m. N.E. of Los Angeles, and about 20 m. from the Pacific Ocean. Pop. (1880) 391; (1890) 4882; (1900) 9117, of whom 1278 were foreign-born; (1910 census) 30,291. Area about 11 sq. m. It is served by the Southern Pacific, the Santa Fé, and the San Pedro, Los Angeles & Salt Lake railway systems, and by interurban electric lines. The city lies at an altitude of 750-1000 ft., about 5 m. from the base of the Sierra Madre range. Some half-dozen mountain peaks in the immediate environs rise to heights of 3200 to more than 6000 ft., notably Mt Wilson (6666 ft.), whose base is about 5 m. north-east of Pasadena, Echo mountain (4016 ft.), and Mt Lowe (6100 ft). From Rubio canyon, near Mt Wilson, to the summit of Echo mountain, runs a steep cable railway, 1000 yds. long. On Echo mountain is the Lowe Observatory (3500 ft.), with a 16-in. equatorial telescope, and on Mt Wilson is the Solar Observatory (9886 ft.) of the Carnegie Institution of Washington, equipped with a 60-in. reflecting telescope and other instruments for stellar photography, a horizontal telescope for solar photography,

---

1 Many naturalists have held a different opinion, some making it a woodcock, a godwit, or even the hazel-hen or grouse; see the discussion by Lord Lilford in Linn. (1862), pp. 358-366.
a 60-ft. tower telescope (completed in 1907), and a second tower telescope of 150 ft. focal length (under construction in 1910). At this observatory important researches in solar and stellar spectroscopy have been carried on under the direction of George Ellery Hale. (1868), the inventor of the spectroheliograph. The physical laboratory, computers' offices and instrument construction shops of the Solar Observatory are in Pasadena. About 5 m. south-east of Pasadena, in the township of San Gabriel (pop. 2501 in 1900), is the Mission (monastery) de San Gabriel Arcangel, founded in 1771. Pasadena is one of the most beautiful places in southern California. Fruits and flowers and sub-tropical trees and small plants grow and bloom the year round in its gardens. On the first of January of every year a flower carnival, known as the "Tournament of Roses," is held. Among the principal public buildings are a handsome Romanesque public library, which in 1909 contained about 28,500 volumes, an opera house of considerable architectural merit, high school, and several fine churches. The surrounding country was given over to sheep ranges until 1874, when a fruit-growing colony, organized in 1873, was established, from which the city was developed. The sale of town lots began in 1882. Pasadena was first chartered as a city in 1886; by a clause in the present free-holders' charter, adopted in 1901, saloons are prohibited in the city.

**PASARGADAE**, a city of ancient Persia, situated in the modern plain of Marghur, some 60 m. N.E. of the later Persepolis. The name originally belonged to one of the tribes of the Persians, which included the clan of the Achaemenides, from which sprang the royal family of Cyrus and Darius (Herod. i. 125; a Pasargadian Badre is mentioned. Herod. iv. 167). According to the account of Ctesias (preserved by Anaximenes of Lampscus in Steph. Byz. s. v. Πασαργάδα; Strabo xv. 730, cf. 729; Nicol. Damasc. fr. 66, 68 sqq.; Polyaen. vii. 6, 1, 45, 2), the last battle of Cyrus against Assyrgas, in which the Persians were incited to a desperate struggle by their women, was fought here. After the victory Cyrus built a town, with his palace and tomb, which was named Pasargadae after the tribe (cf. Curt. v. 6, 19; x. 1, 22). Every Persian king was, at his accession, invested here, in the sanctuary of a warlike goddess (Anaitis?), with the garb of Cyrus, and received a meal of figs and terebinths with a cup of sour milk (Plut. Artax. 3) and whenever he entered his native country he gave a gold piece to every woman of Pasargadae in remembrance of the heroic intervention of their ancestors in the battle (Nic. Damasc. loc. cit.; Plut. Alex. 69). According to a fragment of the same tradition, preserved by Strabo (xv. 729), Pasargadae lay "in the hollow Persis (Coda Persis) on the bank of the river Cyrus, after which the king changed his name, which was formerly Atrades;" (in Nic. Damasc. this is the name of his father). The river Cyrus is the Kur of the Persians, now generally named Bandamir; the historians of Alexander call it Araxes, and give to its tributary, the modern Pulvar, which passes by the ruins of Murghab and Persepolis, the name Medos (Strabo xv. 729; Curt. v. 6, 7). The capital of Cyrus was soon supplanted by Persepolis, founded by Darius; but in Pasargadae remained a great treasury, which was surrendered to Alexander in 336 after his conquest of Persis (Arrian iii. 18, 10; Curt. v. 6, 10). After his return from India he visited Pasargadae on the march from Carmania to Persepolis, found the tomb of Cyrus plundered, punished the malefactors, and ordered Aristobulus to restore it (Arrian vi. 29; Strabo xv. 730). Aristobulus' description agrees exactly with the ruins of Murghab on the Bandamir, about 30 m. upwards from Persepolis; and all the other references in the historians of Cyrus and Alexander indicate the same place. Nevertheless, some modern authors have doubted the identity of the ruins of Murghab with Pasargadae, as Ptolemy (vi. 4, 7), places Pasargada or Pasarracha south-eastwards of Persepolis, and mentions a tribe Pasargadae in Carmania on the sea (vi. 8, 12); and Pliny, Nat. hist. vi. 90, names a Persian

river Sitioganus, "on which one navigates in seven days to Pasargadae." But it is evident that these accounts are erroneous. The conjecture of Oppert, that Pasargadae is identical with Pish Mardan, the "description de montaigne Arakadi" of the Naupar Gaumâta (Smerdis) proclaimed himself king, whose successor, the second false Smerdis Vahyázâdâ, gathered an army (inscription of Behistun, i. 11; iii. 41), is hardly probable.

The principal ruins of the town of Pasargadae at Murghab are a great terrace like that of Persepolis, and the remnants of three buildings, on which the building inscription of Cyrus, "I Cyrus the king the Achaemenid" and the "Sermès" (see Sermès) are included, occur five times in Persian, Susian and Babylonian. They were built of bricks, with a foundation of stones and stone door-cases, and the palaces at Persepolis; and on these fragments of a procession of tribute-bearers and the figure of a winged demon (wrongly considered as a portrait of Cyrus) are preserved. Outside the town are two tombs in the form of towers and the tomb of Cyrus himself, a stone house on a high substruction which rises in seven great steps, surrounded by a court with columns; at its side the remains of a guardhouse, in which the officiating Magians lived, are discernible. The ruins of the tomb absolutely correspond to the description of Aristotle.

See Sir W. Gage-Ouseley, Travels in Persia (1811); Morier, Kor Persepolis, and other; Layard, Excavations at Persepolis, etc.; Flandin and Coste, "Voyage Perse, vol. ii.; Stolze, Persepolis; Dieulafoy, "L'Art antique de la Perse;" and E. Herzfeld, "Pasargadae," in Beiträge zur alten Geschichte, vol. viii. (1908), who has in many points corrected and enlarged the earlier descriptions and has proved that the buildings as well as the sculptures are earlier than those of Persepolis, and are, therefore, built by Cyrus the Great. New photographs of the monuments are published by Fr. Sarre, Iranische Paläoreliefs (unter Mitwirkung von E. Herzfeld, Berlin, 1908).

**PASCAL, BLAISE** (1623-1662), French religious philosopher and mathematician, was born at Clermont Ferrand on the 19th of June 1623. His father was Étienne Pascal, president of the Chamber of Aids at Clermont; his mother's name was Antoinette Bégon. The Pascal family were Auvergnats by extraction as well as by residence, had many generations held posts in the civil service, and were ennobled by Louis XI. in 1478, but did not assume the de. The earliest anecdote of Pascal is one of his being bewitched and freed from the spell by the witch with strange ceremonies. His mother died when he was about four years old, and left him with two sisters—Gilberte, who afterwards married M. Perier, and Jacqueline. Both sisters are of importance in their brother's history, and both are said to have been beautiful and accomplished. When Pascal was about seven years old his father gave up his official post at Clermont, and betook himself to Paris. It does not appear that Blaise, who went to no school, but was taught by his father, was at all forced, but rather the contrary. Nevertheless he has a distinguished place in the story of precocious children, and in the much more limited chapter of children whose precocity has been followed by great performance at maturity, though he never became what is called a learned man, perhaps did not know Greek, and was pretty certainly indebted for most of his miscellaneous reading to Montaigne.

The Pascal family, some years after settling in Paris, had to go through a period of adversity. Étienne Pascal, who had bought some of the hotel-de-ville rentes, protested against Richelieu's reduction of the interest, and to escape the Bastille had to go into hiding. He was according to the story (told by Jacqueline herself, restored to favor by the good acting and graceful appearance of his daughter Jacqueline in a representation of Scudéry's *Amour tyrannique* before Richelieu. Mme d'Aiguillon's intervention in the matter was perhaps as powerful as Jacqueline's acting, and Richelieu gave Étienne Pascal (in 1641) the important and lucrative

---

1 E.g. Weissbach in Zeitschr. d. d. morgent. Ges., 48, pp. 653 sqq.; for the identification cf. Stolze, Persepolis, ii. 269 sqq.; Curzon, Persis, ii. 41 sqq. **(In vi. 116, he places the "Castle of Frasargida, where is the tomb of Cyrus, and which is occupied by the Maği"—i.e. the guard of Magians mentioned by Aristobulus, which had to protect the tomb—eastwards of Persepolis, and by a curious confusion joins it to Ecbatana.**
though somewhat troublesome intendency of Rouen. The family accordingly removed to the Norman capital, though Gilles, Pascal shortly after, on her marriage, returned to Clermont. At Rouen they became acquainted with Corneille, and Blaise pursued his studies with such vehemence that he already showed signs of an injured constitution. Nothing, however, of importance happened till the year 1646. Then Pascal the elder was confined to the house by the consequences of an accident on the ice, and was visited by certain gentlemen of the neighbourhood who had come under the influence of Saint-Cyran and the Jansenists. It does not appear that up to this point the Pascal family had been agitators of religion, but they now eagerly embraced the creed, or at least the attitude of Jansenism, and Pascal himself showed his zeal by informing against the supposed unorthodoxy of a Capuchin, the Père Saint-Ange.

His bodily health was at this time very far from satisfactory, and he appears to have suffered, not merely from acute dyspepsia, but from a kind of paralysis. He was, however, indefatigable in his mathematical work. In 1647 he published his Nouvelles expériences sur le vide, and in the next year the famous experiment with the barometer on the Puy de Dome was carried out for him by his brother-in-law Perier, and repeated on a smaller scale by himself at Paris, to which place by the end of 1647 he and his sister Jacqueline had removed, to be followed shortly by their father. In a letter of Jacqueline's, dated the 27th of September, an account of a visit paid by Descartes to Pascal is given, which, like the other information on the relations of the two, give strong suspicion of mutual jealousy. Descartes, however, gave Pascal the very sensible advice to stay in bed as long as he could (it may be remembered that the philosopher himself never got up till eleven) and to take plenty of beef-tea. As early as May 1648 Jacqueline Pascal was strongly drawn to Port Royal, and her brother frequently accompanied her to its church. She desired indeed to join the convent, but her father, who returned to Paris with the dignity of counsellor of state, acquiesced of the plan, and took both brother and sister to Clermont, where Pascal remained for the greater part of two years. E. Fléchier, in his account of the Grands Jours at Clermont many years after, speaks of a "bele savante" in whose company Pascal had frequently been—a trivial mention on which, as on many other trivial points of scantily known lives, the most childish structures of comment and conjecture have been based. It is sufficient to say that at this time, despite the Rouen "conversion," there is no evidence to show that Pascal was in any way a recluse, an ascetic, or in short anything but a young man of great intellectual promise and performance, not indifferent to society, but of weak health. He, his sister, and their father returned to Paris in the late autumn of 1650, and in September of the next year Étienne Pascal died. Almost immediately afterwards Jacqueline fulfilled her purpose of joining Port Royal—a proceeding which led to some soreness, finally healed, between her and her father, and the disposal of her property. It has sometimes been supposed that Pascal, from 1651 or earlier to the famous accident of 1654, lived a dissipated, extravagant, worldly, luxurious (though admittedly not vicious) life with his friend the duc de Roannez and others. His Discours sur les passions de l'amour, a striking and characteristic piece, not very long since discovered and printed, has also been assigned to this period, and has been supposed to indicate a hopeless passion for Charlotte de Roannez, the duke's sister. But this is sheer romancing. The extant letters of Pascal to the lady show no trace of any affection (stronger than friendship) between them. It is, however, certain that in the autumn of 1654 Pascal's second "conversion" took place, and that it was lasting. He betook himself at first to Port Royal, and began to live a recluse and austere life there. Mme Perier simply says that Jacqueline persuaded him to abandon the world. Jacqueline represents the retirement as the final result of a long course of dissatisfaction with mundane life. But there are certain anecdotic embellishments of the act which are too famous to be passé over, though they are in part apocryphal. It seems that Pascal in driving to Neufchâtel was run away with by the horses, and would have been killed in the event but that the traces fortunately broke. To this, which seems authentic, is usually added the tradition (due to the abbé Boileau) that afterwards he used at times to see an imaginary precipice by his bedside, or at the foot of the chair on which he was sitting. Further, from the 23rd of November 1654 dates the singular document usually known as "Pascal's amulet," a parchment slip which he wore constantly about him, and which bears the date followed by some lines of incoherent and strongly mystical devotion.

It must be noted that, though he lived much at Port Royal, and partly at least observed its rule, he never actually became one of its famous solitaries. But for what it did for him (and for a time his health as well as his peace of mind seems to have been improved) he very soon paid an ample and remarkable return. At the end of 1655 Arnauld, the chief light of Port Royal, was condemned by the Sorbonne for heretical doctrine, and it was thought important by the Jansenist and Port Royal party that steps should be taken to disabuse the religious mind. Arnauld would have undertaken the task himself, but his wiser friends knew that his style was anything but popular, and overruled him. It is said that he personally suggested to Pascal to try his hand, and that the first of the famous Provinciales (Provincial Letters, properly Lettres écrites par Louis de Montale à un provincial de ses amis) was written in a few days, or, less probably, in a day. It was printed without the real author's name on the 23rd of January 1656, and, being immensely popular, and successful, was followed by others to the number of eighteen.

Shortly after the appearance of the Provinciales, on the 24th of May 1656, occurred the miracle of the Holy Thorn, a fragment of the crown of Christ preserved at Port Royal, which cured the little Marguerite Perier of a fistula lacrymalis. The Jesuits were much mortified by this Jansenist miracle, which, as it was officially recognized, they could not openly deny. Pascal and his friends rejoiced in proportion. The details of his later years after this incident are somewhat scanty. For years before his death we hear only of acts of charity and of, as it seems to modern ideas, extravagant asceticism. Thus Mme Perier tells us that he disliked to see her caress her children, and would not allow the beauty of any woman to be talked of in his presence. What may be called his last illness began as early as 1658, and as the disease progressed it was attended with more and more pain, chiefly in the head. In June 1662, having given up his own house to a poor family who were suffering from small-pox, he went to his sister's house to be nursed, and never afterwards left it. His state was, it seems, mistaken by his physicians, so much so that the offices of the Church were long put off. He was able, however, to receive the Eucharist, and soon afterwards died in convulsions on the 9th of August. A post mortem examination was held, which showed not only emaciation in the stomach and other organs, but a serious lesion of the brain.

Eight years after Pascal's death appeared what purported to be his Pensées, and a preface by his nephew Perier gave the world to understand that these were fragments of a great projected apology for Christianity which the author had, in conversation with his friends, planned out years before. The editing of the book was peculiar. It was submitted to a committee of influential Jansenists, with the duc de Roannez at their head, and, in addition, it bore the imprints of numerous unoficial approvers who testified to its orthodoxy. It does not appear that there was much suspicion of the garbling which had been practised—garbling not unusual at the time, and excused in this case by the fact of a lull in the troubles of Port Royal and a great desire on the part of its friends to do nothing to disturb that lull. But as a matter of fact no more entirely factitious book ever issued from the press. The fragments which it professed to give were in themselves confused and incoherent enough, nor is it easy to believe that they all formed
PASCAL, BLAISE

part of any such single and coherent design as that referred to above. But the editor omitted, altered, added, separated, condensed and so forth entirely at their pleasure, actually making some changes which seem to have been thought improvements of style. This rifacimento remained the standard text with a few unimportant additions for nearly two centuries, except that, by a truly comic revolution of public taste, Condorcet in 1776 published, after study of the original, which remained accessible in manuscript, another garbling, conducted this time in the interests of unorthodoxy. It was not till 1842 that Victor Cousin drew attention to the absolutely untrustworthy condition of the text, nor till 1844 that A. P. Faugère edited that text from the MS. in something like a condition of purity, though, as subsequent editions have shown, not with absolute fidelity. But even in its spurious condition the book had been recognized as remarkable and almost unique. Its contents, as was to be expected, are of a very chaotic character—of a character so chaotic indeed that the reader is almost at the mercy of the arrangement, perform an arbitrary arrangement, of the editors. But the subjects dealt with concern more or less all the most profound of thought on what may be called the theological side of metaphysics—the sufficiency of reason, the trustworthiness of experience, the admissibility of revelation, free will, foreknowledge, and the rest. The peculiarly disjointed and fragmentary condition of the sentiments expressed by Pascal aggravates the appearance of universal doubt which is present in the Pensées, just as the completely unfinished condition of the work, from the literary point of view, constantly causes slighter or graver doubts as to the actual meaning which the author wished to express. Accordingly the Pensées have always been a favourite exploring ground, not to say a favourite field of battle, to persons who take an interest in their problems. Speaking generally, their tendency is towards the combating of scepticism by a deeper scepticism, or, as Pascal himself calls it, Pyrrhonism, which occasionally goes the length of denying the possibility of any natural theology. Pascal explains all the contradictions and difficulties of human life and thought by the doctrine of the Fall, and relies on faith and revelation alone to justify each other.

Excluding here his scientific attainments (see below), Pascal presents himself for comment in two different lights, the second of which is, if the expression be permitted, a composite one. The first exhibits him as a man of letters, the second as a philosopher, a theologian, and simply a man, for in no one is the colour of the theology and the philosophy more distinctly personal. Yet his character as a man is not very distinct. The accounts of his sister and niece have the defect of all hagiology; they are obviously written rather with a view to the ideas and the wishes of the writers than with a view to the actual and absolute personality of the subject. Except from these interesting but somewhat tainted sources, we know little or nothing about him. Hence conjecture, or at least inference, must always enter largely into any estimate of Pascal, except a purely literary one. Fortunately, there is no possibility of doubt or difficulty to any competent inquirer. The Provincial Letters are the first example of French prose which is at once considerable in bulk, varied and important in matter, perfectly finished in form. They owe not a little to Descartes, for Pascal's indebtedness to his predecessor is unquestionable from the literary side, whatever may be the case with the scientific. But Descartes had had neither the opportunity, nor the desire, nor probably the power, to write anything of the literary importance of the Provinciales. The first example of polite controversial irony since Lucian, the Provinciales have continued to be the best example of it during more than two centuries in which the style has been sedulously practised, and in which they have furnished a model to generation after generation. The unfailing freshness and charm of the contrast between the importance, the gravity, in some cases the dry and abstruse nature, of their subjects, and the lightness, sometimes almost approaching levity in its special sense, of the manner in which these subjects are attacked is a triumph of literary art of which no familiarity dims the splendour, and which no lapse of time can ever impair. Nor perhaps is this literary art really less evident in the Pensées, though it is less clearly displayed, owing to the fragmentary or rather chaotic condition of the work, and partly also to the nature of the subject. The vividness and distinction of Pascal's phrase, his singular faculty of inserting without any loss of dignity in the gravest and most impassioned meditation what may be almost called quips of thought and diction, the intense earnestness of meaning weighting but not confusing the style, all appear here.

No such positive statements as these are, however, possible as to the substance of the Pensées and the attitude of their author. Hitherto the widest differences have been manifested in the estimate of Pascal's opinions on the main questions of philosophy, theology and human conduct. He has been represented as a determined apologist of intellectual orthodoxy animated by an almost fanatical "hatred of reason," and possessed with a purpose to overthrow the appeal to reason; as a sceptic and pessimist of a far deeper dye than Montaigne anxious chiefly to show how any positive decision on matters beyond the range of experience is impossible; as a nervous believer clinging to conclusions which his clearer and better sense showed to be indefensible; as an almost ferocious ascetic and paradoxer affecting the credo quia impossibile in intellectual matters and the odio quia amabile in matters moral and sensuous; as a wanderer in the regions of doubt and belief, alternately bringing a vast though vague power of thought and an unequalled power of expression to the expression of ideas incompatible and irreconcilable. An unbiased study of the scanty facts of his history, and of the tolerably abundant but scattered and chaotic facts of his literary production, ought to enable any one to steer clear of these exaggerations, while admitting at the same time that it is impossible to give a complete and final account of his attitude towards the riddles of this world and others. He certainly was no mere advocate of orthodoxy; he as certainly was no mere victim of terror or scepticism; least of all was he a freethinker in disguise. He appears, as far as can be judged from the fragments of his Pensées, to have seized firmly and fully the central idea of the difference between reason and religion. Where the difficulty rises respecting him is that most thinkers since his day, who have seen this difference with equal clearness, have advanced from it to the negative side, while he advanced to the positive. In other words, most men since his day who have not been contented with a mere concordat, have let religion go and contented themselves with reason. Pascal, equally discontented with the concordat, held fast to religion and continued to fight out the questions of difference with reason. Surveying these positions, we shall not be astonished to find much that is surprising and some things that are contradictory in Pascal's utterances on "les grands sujets." The influence exercised on him by Montaigne is the one fact regarding him which has not been and can hardly be exaggerated, and his well-known sentence "Je suis tout, pourvu que je sois sûr" which to its proper form is one of the most valuable results of modern criticism leaves no doubt possible as to the source of his "Pyrrhonian" method. But it is impossible for anyone who takes Pascal's Pensées simply as he finds them in connexion with the facts of Pascal's history to question his theological orthodoxy, understanding by theological orthodoxy the acceptance of revelation and dogma; it is equally impossible for any one in the same condition to declare him absolutely content with dogma and revelation. It is of the essence of an active mind like Pascal's to explore and state all the arguments which make for or make against the conclusion it is investigating.

To sum up, the Pensées are excursions into the great unknown made with a full acknowledgment of the greatness of that unknown. From the point of view that belief and knowledge, based on experience or reasoning, are separate domains with an unexplored sea between and round them, Pascal is perfectly
comprehensible, and he need not be taken as a deserter from one region to the other. To those who hold that all intellectual exercise outside the sphere of religion is impious or that all intellectual exercise inside that sphere is futile, he must remain an enigma.

There are few writers who are more in need than Pascal of being fully and competently edited. The chief nominally complete edition at present in existence is that of Bosworth (1775, 6 vols., and since reprinted), which not only appeared before any attempt had been made to restore the true text of the Pensées, but is in other respects quite inadequate. The edition of Lahure, 1858, is not much better, though the Pensées appear in their more genuine form. An edition promised for the excellent collection of Les Grandes éditions de la France by A. P. Franck, has been executed as far as the Pensées go by Léon Brunschvicg (3 vols., 1904), who has also issued a one-volume edition. The Études complètes appeared in three volumes (Paris, 1889). Meanwhile, with the exception of the Provincialités (of which there are numerous editions, no one much to be preferred to any other, for the text is undisputed and the book itself contains almost all the exegesis of its own contents necessary), Pascal can be read only at a disadvantage. There are five chief editions of the true Pensées earlier than Brunschvicg's: that of Faugère (1844), the édition princeps; that of Havet (1852, 1867, and 1881), on the whole the best; that of Victor Rohet (1873), good, but arranged and edited with the deliberate intention of making Pascal appear as far as possible a model of careful and interesting text, the important corrections of which have been introduced into Havet's last edition and that of G. Michélet (Freiburg, 1896). Unfortunately, none of these works can be said to be exclusively savage, or to be issues. Both works must chiefly be sought in Bosworth or reprints of it. Works on Pascal are innumerable: Sainte-Beuve's Port Royal, Cousin's writings on Pascal and his Jacqueline Pascal, and the essays of theeditors of the Pensées are all that mention most of the works on the subject. Principal Tulloch contributed a useful little monograph to the series of Foreign Classics for English Readers (Edinburgh and London, 1878). Recent handlings are, in French, E. Boutroux's Pensees (Paris, 1900), and A. M. A. Pensees^, in English, an article in the Quarterly Review (No. 497) for April 1906.

Pascal as Natural Philosopher and Mathematician.—Great as is Pascal's reputation as a philosopher and man of letters, it may be fairly questioned whether his claim to be remembered by posterity as a mathematician and physicist is not even greater. In his two former capacities all will admire the form of his work, while some will question the value of his results; but in his latter capacities no one will dispute either. He was a great mathematician in an age which produced Descartes, Fermat, Huygens, Wallis and Roberval. There are wonderful stories on record of his precocity in mathematical learning, which is sufficiently established by the well-attested fact that he had completed before he was sixteen years of age a work on the quadratures of the cycloid, or the problem that he established the famous theorem that the intersections of the three pairs of opposite sides of a hexagon inscribed in a conic are collinear. This proposition, which he called the mystic hexagram, he made the keystone of his theory; from it alone he deduced more than 400 corollaries, embracing, according to his own account, the conics of Apollonius, and other results innumerable.

Pascal also distinguished himself by his skill in the infinitesimal calculus, then in the embryonic form of Cavalieri's method of indivisibles. The cycloid was a famous curve in those days; it had been discussed by Galileo, Descartes, Fermat, Roberval and Torricelli, who had in turn exhausted their skill upon it. Pascal solved the hitherto refractory problem of the general quadrature of the cycloid, and proposed and solved a variety of others relating to the centre of gravity of the curve and its segments, and to the volume and centre of gravity of solids of revolution generated in various ways by means of it. He published a number of these theorems without demonstration as a challenge to contemporary mathematicians. Solutions were furnished by Wallis, Huygens, Wren and others; and Pascal himself published his own in the form of letters from Amos Detonville (his assumed name as challenger) to Pierre de Carcavy. There has been some discussion as to the fairness of the treatment accorded by Pascal to his rivals, but no question of the fact that his initiative led to a great extension of our knowledge of the properties of the cycloid, and indirectly hastened the progress of the differential calculus.

In yet another branch of pure mathematics Pascal ranks as a founder. The mathematical theory of probability and the allied theory of the combinatorial analysis were in effect created by the correspondence between Pascal and Fermat, concerning certain questions as to the division of stakes in games of chance, which had been propounded to the former by the gaming philosopher De Méré. A complete account of this interesting correspondence would surpass our present limits; but the reader may be referred to Todhunter's History of the Theory of Probability (Cambridge and London, 1865), pp. 7–21.

It appears that Pascal contemplated publishing a treatise De adeo geometria; but all that actually appeared was a fragment on the arithmetical triangle (Traité du triangle arithmétique, "Properties of the Figurate Numbers"), printed in 1654, but not published till 1665, after his death.

Pascal's work as a natural philosopher was not less remarkable than his discoveries in pure mathematics. His experiments and his treatise (written before 1651, published 1665) on the equilibrium of fluids entitle him to rank with Galileo and Stevinus as one of the founders of the science of hydrodynamics. The idea of the pressure of the air and the invention of the instrument for measuring it were both new when he made his famous experiment, showing that the height of the mercury column in a barometer decreases when it is carried upwards through the atmosphere. This experiment was made by himself in a tower at Paris, and was carried out on a grand scale under his instructions by his brother-in-law Florin Périer on the Puy de Dôme in Auvergne. Its success greatly helped to break down the old prejudices, and to bring home to the minds of ordinary men the truth of the new ideas propounded by Descartes and Torricelli.

Whether we look at his pure mathematical or at his physical researches we receive the same impression of Pascal; we see the strongest marks of a great original genius creating new ideas, and seizing upon, mastering, and pursuing farther everything that was fresh and unfamiliar in his time. We can still point to much in exact science that is absolutely his; and we can indicate infinitely more which is due to his inspiration.

(P. G.)

PASCAL, JACQUELINE (1625–1661), sister of Blaise Pascal, was born at Clermont-Ferrand, France, on the 4th of October 1625. She was a genuine infant prodigy, composing verses when only eight years, and a five-act comedy at eleven. In 1646 the influence of her brother converted her to Jansenism. In 1663, she took the veil, despite the strong opposition of her brother, and subsequently was largely instrumental in the latter's own final conversion. She vehemently opposed the attempt to compel the assent of the nuns to the Papal bulls condemning Jansenism, but was at last compelled to yield her own. This blow, however, hastened her death, which occurred at Paris on the 4th of October 1661.

PASCHAL (Paschalis), the name of two popes, and one anti-pope.

PASchal I., pope from 817 to 824, a native of Rome, was raised to the pontificate by the acclamation of the clergy, shortly after the death of Stephen IV., and before the sanction of the emperor (Louis the Pious) had been obtained—a circumstance for which it was one of his first cares to apologize. His
relations with the imperial house, however, never became cordial; and he was also unsuccessful in winning the sympathy of the Roman nobles. He died in Rome while the imperial commissioners were investigating the circumstances under which some Roman CNSs had been seized at the Lateran, blinded and afterwards beheaded; Paschal had shielded the murderers but denied all personal complicity in their crime. The Roman people refused him the honour of burial within the church of St Peter, but he now holds a place in the Roman calendar (May 16). The church of St Cecilia in Trastevere was restored and St Maria in Domincia rebuilt by him; he also built the church of St Prasende. The successor of Paschal I. was Eugenius II. (L. D. *)

PASchal II. (Ranieri), pope from the 13th of August 1099 to the 21st of January 1118, was a native of Bieda, near Viterbo, and a monk of the Cluniac order. He was created cardinal-priest of S. Clemente by Gregory VII. about 1076, and was consecrated pope in succession to Urban II. on the 14th of August 1099. In the long struggle with the emperors over investiture, he zealously carried on the Hildebrandine policy, but with only partial success. In 1104 Paschal succeeded in instigating the emperor's second son to rebel against his father, but soon found Henry V. even more persistent in maintaining the right of investiture than Henry IV. had been. The imperial Diet at Mainz invited (Jan. 1106) Paschal to visit Germany and settle the trouble, but the pope and the Council of Guastalla (Oct. 1105) opposed the prohibition of investiture. In the same year he brought to an end the investiture struggle in England, in which Anselm, archbishop of Canterbury, had been engaged with King Henry I., by retaining himself exclusive right to invest with the ring and crozier, but recognizing the royal nomination to vacant benefices and oath of fealty for temporal domains. He went to France at the close of 1106 to seek the mediation of King Philip and Prince Louis in the imperial struggle, but, his negotiations remaining without result, he returned to Italy in September 1107. When Henry V. advanced with an army into Italy in order to be crowned, the pope agreed to a compact (Feb. 1111), by the terms of which the Church should surrender all the possessions and royalties it had received of the empire and kingdom of Italy since the days of Charlemagne, while Henry on his side should renounce lay investiture. Preparations were made for the coronation on the 12th of February 1111, but the Romans rose in revolt against the compact, and Henry retired taking with him pope and curia. After sixty-one days of harsh imprisonment, Paschal yielded and guaranteed investiture to the emperor. Henry then crowned in Rome the week after his brother's coronation, but a moral victory that no revenge would be taken for what had passed withdrew beyond the Alps. The Hildebrandine party was aroused to action, however; a Lateran council of March 1112 declared null and void the concessions extorted by violence; a council held at Vienna in October actually communicated the emperor, and Paschal sanctioned the proceeding. Towards the end of the pontificate trouble began anew in England, Paschal complaining (1115) that councils were held and bishops translated without his authorization, and threatening Henry I. with excommunication. On the death of the countess Matilda, who had bequeathed all her territories to the Church (1115), the emperor at once laid claim to them as imperial fiefs and forced the pope to flee from Rome. Paschal returned after the emperor's withdrawal at the beginning of 1118, but died within a few days on the 21st of January 1118.

His successor was Gelasius II.
estuaries of the Canche and the Authie (the limit towards Somme). The highest point in the department (700 ft.) is in the south, between Boulogne and St. Omer. From the uplands in which it is situated the Lys and Scarpe flow east to the Scheldt, the Aa north to the German Ocean, and the Slack, Winemereux and Liane to the Channel. Farther south are the valleys of the Canche and the Authie, running E.S.E. and W.N.W., and thus parallel with the Somme. Vast plains, open and monotonous, but extremely fertile and well cultivated, occupy most of the department. To the north of the hills running between St. Omer and Boulogne, to the south of Gravelines and the south-east of Calais, lies the district of the Wattergands, fens now drained by means of canals and dikes, and turned into highly productive land. The climate is free from extremes of heat and cold, but damp and changeable. At Arras the mean annual temperature is 47°; on the coast it is higher. The rainfall varies from 24 to 32 in., though at Cape Gris Nez the latter figure is much exceeded. Cereals are largely grown and give good yields to the acre; the other principal crops are potatoes, sugar-beet, forage, oil-plants and tobacco. Market gardening flourishes in the Wattergands. The rearing of livestock and poultry is actively carried on, and the horses of the Boulonnais are specially esteemed.

The department is the chief in France for the production of coal, its principal coal-basin, which is a continuation of that of Valenciennes, centring round Béthune. The manufacture of beetroot-sugar, oil and alcohol distilling, iron-working, dyeing, brewing, paper-making, and various branches of the textile manufacture, are foremost among the industries of the department. Boulogne, Calais and Étaples fit out a considerable number of vessels for the cod, herring and mackerel fisheries. Calais and Boulogne are important ports of passenger-transit for England; and Boulogne also carries on a large export trade in the products of the department. The canal system comprises part of the Aa, the Lys, the Scarpe, the Deûle (a tributary of the Lys passing by Lille), the Lawe (a tributary of the Lys passing by Béthune), and the Sensée (an affluent of the Scheldt), as well as the canals of Aire to Bauniv, Neufossé, Calais, Calais to Ardes, &c., and in this way a line of communication is formed from the Scheldt to the sea by Béthune, St Omer and Calais, with branches to Gravelines and Dunkirk. The department is served by the Northern railway.

Pas-de-Calais forms the diocese of Arras (archbishopric of Cambrai), belongs to the district of the 1. army corps, the educational division (académie) of Lille and the circumscription of the appeal court of Douai. There are six arrondissements (Arras, Béthune, Boulogne, Montreuil-sur-Mer, St Omer and St Pol); the smaller district of Boulogne and the more noteworthy places are Arras, the capital, Boulogne, Calais, St Omer, Béthune, Lens, Montreuil-sur-Mer, Bruay, Berck, Étaples and Aire-sur-la-Lys, which are noticed separately. Besides some of the towns mentioned, Liblin (2,070), Hénin-Liéard (13,384), in the neighbourhood of Lens, are large centres of population. Other places of some importance are: Lillers (pop. 5,341), which carries on boot-making and has a fine Romanesque church of the 12th century; Hesdin, which owes its regular plan to Charles V., by whom it was built; and St Pol, which has the remains of medieval fortifications and castles and gave its name to the famous counts of St Pol.

PASDELOUP, JULES ÉTIENNE (1830–1887), French conductor, was born in Paris, and educated in music at the conservatoire. He founded in 1851 a 'société des jeunes artistes du conservatoire.' Two of his more noteworthy concerts, did much to perfectize the best new compositions of the time. His "popular concerts" at the Cirque d'hiver, from 1861 till 1884, had also a great effect in promoting French taste in music.

PASEWALK, a town of Germany, in the Prussian province of Pomerania, on the Ucker, 26 m. N.W. from Stettin by the railway to Strassburg. Pop. (1905), 10,519. Pasaewalk became a town during the 12th century and was soon a member of the Hanseatic League. In 1359 it passed to the duke of Pomerania. Frequently ravaged during the wars which devastated the district, it was plundered several times by the imperialists during the Thirty Years' War; in 1657 it was burnt by the Poles and in 1713 by the Russians. By the peace of Westphalia in 1648 it was given to Sweden, but in 1670 it was conquered by Brandenburg, and in 1720, by the peace of Stockholm, it was definitely assigned to Brandenburg-Prussia.

See Hückstädt, Geschichte der Stadt Pasewalk (Pasaewalk, 1883).

PASHA. also written "pacha" and formerly "pashaw," &c., a Turkish title, superior to that of bey (q.v.), borne by persons of high rank and placed after the name. It is in the gift of the sultan of Turkey and, by delegation, of the khedive of Egypt. The title appears, originally, to have been bestowed exclusively upon military commanders, but it is now given to any high official, and also to unofficial persons whom it is desired to honour. It is conferred indifferently upon Moslems and Christians, and is frequently given to foreigners in the service of the Turks or Egyptians. Pashas are of three grades, formerly distinguished by the number of horse-tails (three, two and one respectively) which they were entitled to display as symbols of authority when on campaign. A pashalik is a province governed by or under the jurisdiction of a pasha.

The word is variously derived from the Persian pādhāsh, Turkish pādishāh, equivalent to king or emperor, and from the Turkish bash, in some dialects pash, a head, chief, &c. In old Turkish there was no fixed distinction between b and p. As first used in western Europe the title was written with the initial b. The English forms bashaw, bassaw, bucha, &c., general in the 16th and 17th centuries, were derived through the med. Lat. and Ital. basa.

PASIG, a town and the capital of the province of Rizal, Luzon, Philippine Islands, about 6 m. E.S.E. of Manila. Pop. (1903), 11,287. The town, which covers a considerable area, is traversed by the Pasig river and its tributary, the Mariquina river, and for a short distance borders on Laguna de Bay. In the south-western part is Fort McKinley. Although built on low ground, Pasig is fairly healthy. It was formerly an important commercial centre, the inhabitants being largely engaged in a carrying and forwarding trade between Manila and the lake ports; but this trade was lost after the establishment of direct rail and steamboat service between these ports. The principal industries are rice-farming, the manufacture of a cheap red pottery, and fishing. The language is Tagalog.

PASTITELES, the most important member of the Neo-Attic school of sculpture in the time of Julius Caesar. At that period there was at Rome a demand for copies of, or variations on, noted works of Greek sculpture; the demand was met by the workshops of Pastiteles and his pupils Stephanus and Menelaus and others, several of whose statues are extant. In works of imitation from early Dorian models they introduced refinements of their own, with the result that they produced beautiful, but somewhat vapid and academic types. Pastiteles is said by Pliny (Nat. Hist. xxxvi. 39) to have been a native of Magna Graecia, and to have been granted the Roman citizenship.

PASKEVICH, IVAN FEDOROVICH (1782–1836), count of Erivan, prince of Warsaw, Russian field marshal, descended from an old and wealthy family, was born at Poltava on the 19th (30th) of May 1782. He was educated at the imperial institution for pages, where his progress was rapid, and in 1800 received his commission in the Guards and was named aide-de-camp to the tsar. His first active service was in 1805, in the auxiliary army sent to the assistance of Austria against France. He took part in the battle of Austerlitz. From 1807 to 1812 he was engaged in the campaigns against Turkey, and distinguished himself by many brilliant and daring exploits, being made a general officer in his thirtieth year. During the French War of 1812–14 he was present, in command of the 26th division of infantry, at all the most important engagements; at the battle of Leipzig he won promotion to the rank of lieutenant-general. On the outbreak of war with Persia in 1826 he was appointed second in command, and, succeeding in the following year to the chief command, gained rapid and brilliant successes which compelled the shah to sue for peace in February.
PASLEY—PASQUIER, DUKE

1828. In reward of his services he was named by the emperor count of Erivan, and received a million of roubles and a diamond-mounted sword. From Persia he was sent to Turkey in Asia, and, having captured in rapid succession the principal fortresses, he was at the end of the campaign made a field marshal at the age of forty-seven. In 1839 he subdued the mountaineers of Daghestan. In 1851 he was entrusted with the command of the army sent to suppress the revolt of Poland, and after the fall of Warsaw, which gave the death-blow to Polish independence, he was raised to the dignity of prince of Warsaw, and created viceroy of the kingdom of Poland. On the outbreak of the insurrection of Hungary in 1848 he was appointed to the command of the Russian troops sent to the aid of Austria, and finally compelled the surrender of the Hungarians at Vilagos. In April 1854 he again took the field in command of the army of the Danube, but on the 9th of June, at Silistra, where he suffered defeat, he received a contusion which compelled him to retire from active service. He died on the 13th (1st) of February 1885 at Warsaw, where in 1869 a memorial was erected to him. He held the rank of field marshal in the Prussian and Austrian armies as well as in his own service.

See Tolstoy, Essai biographique et historique sur le general Pasley (Paris, 1853); Notice biographique sur le Marechal Paskevitch (Leipzig, 1856); and Prince Stcherbatov's Life (St Petersburg, 1888-1894).

PASLEY, SIR CHARLES WILLIAM (1780-1861), British soldier and military engineer, was born at Eskdale Muir, Dumfriesshire, on the 8th of September 1780. In 1796 he entered the Royal Military Academy, Woolwich; a year later he gained his commission in the Royal Artillery, and in 1798 he was transferred to the Royal Engineers. He was present in the defence of Gaeta, the battle of Maida and the siege of Copenhagen. In 1807, being then a captain, he went to the Peninsula, where his knowledge of Spanish led to his employment on the staff of Sir David Baird and Sir John Moore. He took part in the retreat to Corunna and the Walcheren Expedition, and received a severe wound while gallantly leading a storming party at Flushing. During his tedious recovery he employed himself in learning German. He saw no further active service, the rest of his life being devoted to the foundation of a complete scientific and technical theory and organization of training of the corps of Royal Engineers. He was so successful that, though only a captain, he was allowed to act for two years as commanding royal engineer at Plymouth and given a special grant. The events of the Peninsular War having emphasized the need of a fully trained engineer corps, Pasley's views were adopted by the war office, and he himself placed at the head of the new school of military engineering at Woolwich. This was in 1812, and Pasley was at the same time gazetted brevet major. He became brevet lieutenant-colonel in 1813 and substantive lieutenant-colonel in 1814. The first volume of his Military Instruction appeared in 1814, and contained a course of practical geometry which he had framed for his company at Plymouth. Two other volumes completing the work appeared by 1817, and dealt with the science and practice of fortification, the latter comprising rules for construction. He published a work on Practical Architecture, and prepared an important treatise on The Practical Operations of a Siege (1829-1832), which was translated into French (1847). He became brevet colonel in 1830 and substantive colonel in 1831. From 1831 to 1844 the subjects that engaged his leisure was that of standardization of coins, weights and measures, and he published a book on this in 1854. In 1838 he was presented with the freedom of the city of London for his services in removing sunken vessels from the bed of the Thames near Gravesend; and from 1839 to 1844 he was occupied with clearing away the wrecks of H.M.S. "Royal George" from Spithead and H.M.S. "Edgar" from St Helens. All this work was subsidiary to his great work of creating a comprehensive art of military engineering. In 1841 he was promoted to the rank of major-general he was made inspector-general of railways. In 1846 on vacating this appointment he was made a K.C.B., and thenceforward up to 1855 was chiefly concerned with the East India Company's military academy at Addiscombe. He was promoted lieutenant-general in 1851, made colonel commandant of the Royal Engineers in 1853, and general in 1860. He died in London on the 9th of April 1861. His eldest son, Major-General Charles Pasley (1824-1890), was a distinguished Royal Engineer officer.

Among Pasley's works, besides those mentioned, were separate editions of his Practical Geometry Method (1822) and of his Course of Elementary Fortification (1822), both of which formed part of his Military Instruction; Rules for Escalading Fortifications not having Published Covered Ways (1822; new eds. 1845 and 1854); Descriptions of a semaphore invented by himself in 1804 (1822 and 1823); A Simple Practical Treatise on Field Fortification (1823); and Exercise of the Newdecked Pontoons invented by Lieutenant-Colonel Pasley (1825).

PASQUIER, ETIENNE (1529-1615), French lawyer and man of letters, was born at Paris, on the 7th of June 1529 by his own account, according to others a year earlier. He was called to the Paris bar in 1549. In 1558 he became very ill through eating poisonous mushrooms, and did not recover fully for two years. This compelled him to occupy himself by literary work, and in 1560 he published the first book of his Recherches de la France. In 1569, when he was 40 years old, he was created by a great speech still extant, in which he pleaded the cause of the university of Paris against the Jesuits, and won it. Meanwhile he pursued the Recherches steadily, and published from time to time much miscellaneous work. His literary and his legal occupations coincided in a curious fashion at the Grands Jours of Poitiers in 1579. These Grands Jours (an institution which fell into desuetude at the end of the 17th century, with bad effects on the social and political welfare of the French provinces) were a kind of irregular assize in which a commission of the parlement of Paris, selected and despatched at short notice by the king, had full power to hear and determine all causes, especially those in which seignorial rights had been abused. At the Grands Jours of Poitiers of the date mentioned, and at those of Troyes in 1583, Pasquier officiated; and each occasion has left a curious legal memorial of the jests with which he and his colleagues relieved their gravest duties. The Poitiers work was the celebrated collection of poems on a flea (see Southey's Doctor). In 1579 he was appointed by Henry III. advocate-general at the Paris courts des comptes, an important body having political as well as financial and legal functions. Here he distinguished himself particularly by opposing, sometimes successfully, the mischievous system of selling hereditary places and offices, which more perhaps than any single thing was the curse of the older French monarchy. The civil wars compelled Pasquier to leave Paris and for some years he lived at Tours, working steadily at his great book, but he returned to Paris in Henry IV.'s train in March 1594. He continued until 1604 at his work in the chambre des comptes; then he retired. He survived this retirement more than ten years, producing much literary work, and died after a few hours' illness on the 1st of September 1615.

In so long and so laborious a life Pasquier's work was naturally considerable, and it has never been fully collected or indeed printed. The standard edition by Paul Dechamps (1847) is divided into five parts, and is calculated to afford the very best edition for ordinary readers the selections of Léon Feugère, published at Paris (2 vols. 8vo, 1849), with an elaborate introduction, are most accessible. As a poet Pasquier is chiefly interesting as a minor poet of the Pléiade. As an essayist he is of much more account. The three chief divisions of his prose work are his Recherches, his letters and his professional speeches. The letters are of much biographical interest and historical importance, and the Recherches contain in a somewhat miscellaneous fashion invaluable information on a vast variety of subjects, literary, political, anti-

PASQUIER, ETIENNE DENIS, DUKE (1757-1862), French statesman, was born on the 22nd of April 1767. Descended from a family which had long been distinguished at the bar and in connexion with the parlements of France, he was destined for the legal profession and was educated at the college of Jully. He then became a counsellor of the parlement of Paris, and witnessed many of the incidents that marked the growing hostility between that body and Louis XVI. in the years preceding the outbreak of the French Revolution in 1789. His views
were those of a moderate reformer, who desired to renovate but
did not to end the institutions of the old monarchy; and his memoirs
set forth in a favourable light the actions of that parliament,
the existence of which was soon to be terminated amid the
political storms of the close of the year 1789. For some time,
and especially during the Reign of Terror (1793-1794), Pasquier
remained in obscurity; but this did not save him from arrest
in the year 1794. He was thrown into prison shortly before
the coup d'état of Thermidor (July 1794) which overthrew
Robespierre. In the reaction in favour of ordinary govern-
ment which ensued Pasquier regained his liberty and his estates.
He did not re-enter the public service until the period of the
Empire, when the arch-chancellor Cambacérés used his influence
with Napoleon to procure for him the office of “maître des
requêtes” to the council of state. In 1809 he became baron
of the French Empire, and in February 1810 counsellor of state.
Napoleon in 1810 made him prefect of police. The chief event
which ruffled the course of his life at that time was the strange
conspiracy of the republican general Malet (Oct. 1812), who,
giving out that Napoleon had perished in Russia, managed
to surprise and capture some of the ministers and other authorities
at Paris, among them Pasquier. The collapse of this bold
attempt enabled him, however, speedily to regain his liberty.

When Napoleon abdicated in April 1814 Pasquier continued
to exercise his functions for a few days in order to preserve
order, and then resigned the prefecture of police, whereupon
Louis XVIII. allotted to him the control of roads and bridges.
He took no share in the imperial restoration at the time of
the Hundred Days (1815), and after the second entry of Louis XVIII.
into Paris he became minister of the interior, but finding it
impossible to work with the hot-headed royalists of the Chamber
of Deputies (La Chambre intrépode), he resigned office. Under
the more moderate ministers of succeeding years he again held
various appointments, but refused to join the reactionary
cabinets of the close of the reign of the two succeeding
so-called Consuls and of Napoleon, in which he was not
the chief personage, in the Chamber of Peers
—a post which he held through the whole of the reign of Louis
Philippe (1830-1848). In 1842 he was elected a member of the
French Academy, and in the same year was created a duke.
After the overthrow of Louis Philippe in February 1848, Pasquier
retired from active life and set to work to compile the notes and
reminiscences of his long and active career. He died in 1862.

See Mémoires du Chancelier Pasquier (6 vols., Paris, 1804-1895;
partly translated into English, 4 vols., London, 1895-1894). Also

(P. H. R.)

PASQUINADE, a variety ofibel or lampoon, of which it is not
easy to give an exact definition, separating it from other kinds.
It should, perhaps, more especially deal with public men
and public things. The distinction, however, has been rarely
observed in practice, and the chief interest in the world is its
curious and rather legendary origin. The earliest
version, given by Mozocchi in 1590, Pasquino was a schoolmaster
(others say a cobbler), who had a biting tongue, and lived in
the 15th century at Rome. His name, at the end of that century
or the beginning of the next, was transferred to a statue which
had been dug up in 1591 in a mutilated condition (some say near
his shop) and was set up at the corner of the Piazza Navona,
opposite the palace of Cardinal Caraffa. To this statue it
became the custom to affix squibs on the papal government and
on prominent persons. At the beginning of the 16th century
Pasquin had a partner provided for him in the shape of another
statue found in the Campus Martius, said to represent a river
god, and dubbed Marforio, a foro Martis. The regulation form
of the pasquinade then became one of dialogue, or rather question
and answer, in which Marforio usually addressed leading inquiries
to his friend. The proceeding soon attained a certain European
fashion, and collections of pasquinades, in good Latin or the
Italian tongue, were long written in Latin verse, with an occasional
cursus into Greek) appeared in 1590. In the first book of Pantagruel
(1532 or thereabouts) Rabelais introduces books by Pasquillus
and Marphuris in the catalogue of the library of St Victor,
and later he quotes some utterances of Pasquin's in his letters to
the bishop of Maillezais. These, by the way, show that Pasquin
was by no means always satirical, but dealt in grave advice and
comment. The original Latin pasquinades were collected in
1544, as Pasquillorum tomus duo, edited by Caelius Secundus
Curio. The vogue of these lampoons now became general, and
rose to its height during the pontificate of Sixtus V. (1585-1590).
These utterances were not only called pasquinades (pasquinate)
but simply pasquils (pasquillus, pasquillo, pasquille), and this
form was sometimes used for the mythical personage himself. It
was used in English for purposes of satire by Sir Thomas Elyot,
in his Pasquin the Plain (1546) and by the anonymous author of
Pasquin in a Trance (1560); but it was first made popular
in England by Thomas Nash, who in 1580 began to sign his violent
ephemeral pamphlets with the pseudonym of Pasquil of
England. It continues to occur through the course of the
Amber Precipitation controversy as the title of the enemy of the Puritans.
These English lampoons were in prose. The French pasquils
(examples of which may be found in Fournier's Variétés his-
toriques et littéraires) were more usually in verse. In Italy itself
Pasquin is said not to have condescended to the vernacular
until the 18th century. Contemporary comic periodicals, especially
in Italy, still occasionally use the Marforio-Pasquino dialogue
form. But this survival is purely artificial and literary, and
Pasquinade has, as noted above, ceased to have any precise
meaning.

PASQUINI, BERNARDO (1637-1710), Italian musical com-
poser, was born at Massa in Val di Nievele (Tuscany) on
the 8th of December 1637. He was a pupil of Marcantonio Cesti
and Loreto Vittori. He came to Rome while still young and
entered the service of Prince Borghese; later he became
organist of St Maria Maggiore. He enjoyed the protection of Queen
Christina of Sweden, in whose honour an opera of his, Don'v amore è pieta, was produced in 1679. During Alessandro
Saraceni's stay in Rome (1763-1768), Pasquini and Corelli were frequently associated with him in musical perfor-
mances, especially in connexion with the Arcadian Academy, of
which all three were members. Pasquini died at Rome on the
22nd of November 1710, and was buried in the church of St
Lorenzo in Lucina. He deserves remembrance as a vigorous
composer for the harpsichord; and an interesting account of
his music for this instrument will be found in J. S. Shedlock's
The Pianoforte Sonata.

PASSACAGLIA, the name of an old Spanish dance, supposed
to be derived from pasar, to walk, and calle, street, the tune
being played by wandering musicians in the streets. It was a
slow and rather solemn dance of one or two dancers. The dance
tune resembled the "chaconne," and was, like it, constructed
on a ground-bass. Brahms's Symphony in E Minor, No. 4,
with an elaborate passacaglia.

PASSACAGLIA, CARLO (1872-1889), Italian divine, was born at
Livorno on the 28th of May 1872. Passaglia was soon destined
for the priesthood, and was placed under the care of the Jesuits
at the age of fifteen. He became successively doctor in mathe-
matics, philosophy and theology in the university of Rome.
In 1884 he was made professor in the Collegio Romano, the
well-known Jesuit college in Rome. In 1885 he took the vows as
a member of the Jesuit order. In 1888, during the expulsion
of the Jesuits from Rome which followed on the revolutionary
troubles in the Italian peninsula, he paid a brief visit to England.
On his return to Italy he founded, with the assistance of Father
Curci and Luigi Taparelli d'Azeglio, the celebrated organ of
the Jesuit order entitled the Civiltà Cattolica. In 1894 came
the decision of the Roman Church on the long-debated question
of the Immaculate Conception of the Virgin. Into the agitation
for the promulgation of this dogma Passaglia threw himself
with great eagerness, and by so doing recommended himself
strongly to Pope Pius IX. But his favour with the Pope was
of short duration. In 1895, when the war between Austria and
France (the first step towards the unification of Italy) broke out,
Passaglia espoused the popular side. He took refuge at Turin,
and under the influence of Courvoir he wrote an Epistola ad
Episcopos Catholicos pro causa Italice, in which, like Liveraniti before him, he boldly attacked the temporal power of the pope. For this he was expelled from the order of Jesuits, his book was put on the Index, and his figure struck out, by the pope's order from a picture painted to commemorate the proclamation of the dogma of the Immaculate Conception. A refuge from the anger of the pope was afforded him in the Casa Cavour at Turin, the house in which Cavour was born. There he laboured for Italian unity with indomitable energy in the north of Italy, in conjunction with Cardinal d'Andrea in the south, and he collected the signatures of 9000 priests to an address to the pope in opposition to the temporal power, and in favour of abandoning all resistance to the union of Italy under a king of the House of Savoy. He and the 9000 priests were excommunicated on the 6th of October 1862. Passagilia disregarded his excommunication, and continued his work as professor of moral philosophy at Turin, to which he had been appointed in 1861, and began a series of Advent addresses in the church of San Carlo at Milan. But on arriving in order to preach his second sermon he found himself met by an inhibition on the part of Mgr Cazza, the administrator of the diocese of Milan. An elected deputy in the Italian parliament, he still advocated separation of church and state, and in a later period wrote a defence of the rights of the episcopate under the title of La Causa di sua eminenza il cardinale d'Andrea. He also (1864) wrote against Renan's Vie de Jésus. Eight days before his death he endeavoured to be reconciled to the pope, and made a full retractation. He died at Turin on the 12th of March 1887.

PASISAIC, a city of Passaic county, New Jersey, U.S., at the head of navigation on the Passaic river, 5 m. S.E. of Paterson. (Pop. 1890) 13,028; (1900) 27,777, of whom 12,900 were foreign-born; (1910 census), 54,773. Passaic is served by the Erie and the Delaware, Lackawanna & Western railways. The east part of the city is a plain occupied chiefly by factories, for which water-power is furnished by the river and a canal; the west part, which is almost wholly residential, extends over hills which command excellent views. Among the principal buildings are the city hall, and the Jane Watson Reid Memorial Library. The city's factory products increased in value from $8,004,835 in 1900 to $22,782,725 in 1905, or 77%.

About one-half of the 1905 was in worsteds, cottons and woolens; other important manufactures are rubber goods and electrical supplies. There are large vineyards near the city. A settlement was established here by the Dutch in 1674, and was called Acquackanonk or Paterson Landing until the middle of the 19th century. Passaic was incorporated as a village in 1869, and in 1873 was chartered as a city.

PASSAU, a town and episcopal see of Germany, in the kingdom of Bavaria, picturesquely situated at the confluence of the Danube, the Inn and the Iiz, close to the Austrian frontier, 89 m. N.E. from Munich and 71 S.E. of Regensburg by rail. (Pop. 1900), 18,005, nearly all being Roman Catholics. Passau consists of the town proper, lying on the rocky tongue of land between the Danube and the Inn, and of four suburbs, Innsstadt, on the right bank of the Inn, Ilstadt on the left bank of the Iiz, Anger in the angle between the Iiz and the Danube, and St Nikola, it is one of the most beautiful places on the Danube, a fine view being produced by the way in which the houses are piled up one above another on the heights rising from the river. The best general view is obtained from the Oberhaus, an old fortress, now used as a prison, which crowns a hill 300 ft. high on the left bank of the Danube. Of the eleven churches, the most interesting is the cathedral of St Stephen, a florid, rococo edifice. It was built after a fire in the 17th century on the site of a church said to have been founded in the 5th century; it has two towers, and contains some valuable relics. Other churches are the Gothic church of the Holy Ghost; the churches of St Severin, St Paul and of St Gertrude; the double church of St Salvador; the Romanesque church of the Holy Cross; the pilgrimage church of Our Lady of Succour (Marienhilf); the church of the hospital of St John; and the Romanesque Votiv Kirche. The post office occupies the site of a building in which in 1552 the Treaty of Passau was signed between the emperor Charles V. and Maximilian I. The Fine Deutscher Platz contains a statue of the Bavarian king, Maximilian I. The old forts and bastions of the city have been demolished, but the two linked fortresses, the Oberhaus and the Niederhaus, are still extant. The former was built early in the 13th century by the bishop in consequence of a revolt on the part of the citizens; the latter, mentioned as early as 107, is now private property. The chief industries are the manufacture of tobacco, beer, leather, porcelain, machinery and paper. Large quantities of timber are floated down the Iiz. The well-known Passau crucibles are made at the neighbouring village of Obernzell.

Passau is of ancient origin. The first settlement was probably a Celtic one, Boitdorun; this was on the site of the present Innsstadt. Afterwards the Romans established a colony of Batavian veterans, the castra balava here. It received civil rights in 1225, and soon became a prosperous place, but much of its history consists of broils between the bishops and the citizens. The strong fortress of the Oberhaus was taken by the Austrians in 1742, and again in 1805. The bishopric of Passau was founded by the emperor Charles V. The diocese was a large one, including until 1468 not only much of Bavaria, but practically the whole of the archduchy of Austria. About 1260 the bishop became a prince of the empire. Amongst the earlier bishops was Pilgrim or Pilgrim (d. 901), and among the later ones were the Austrian archdukes, Leopold and Leopold William, the former a brother and the latter a son of the emperor Ferdinand II. In 1803 the bishopric was secularized, and in 1805 its lands came into the possession of Bavaria. The area, which was diminished in the 15th, and again in the 18th century, was then about 350 sq. m., and the population about 50,000. A new bishopric of Passau, with ecclesiastical jurisdiction only, was established in 1817.

See Erhart, Geschichte der Stadt Passau (Passau, 1862-1864); and Morin, Passau (1878). For the history of the bishopric see Schöller, Die Bischofe von Passau (Passau, 1844); and Schröd, Passau vom Alterthum (1866).

PASSERATER, JEAN (1534-1602), French poet, was born at Troyes, on the 18th of October 1534. He studied at the university of Paris, and is said to have had some curious adventures —at one time working in a mine. He was, however, a scholar by natural taste, and became eventually a teacher at the Collège de Plessis, and on the death of Ramus was made professor of Latin in 1572 in the Collège de France. In the meanwhile Passerat had studied law, and had composed much agreeable poetry in the Pléiade style, the best pieces being his short ode Du Premier jour de mai, and the charming villanella, J'ai perdu ma tourterelle. His exact share in the Satyre ménippe (Tours, 1594), the great manifesto of the politique or Moderate Royalist party, is not definite, but it is agreed that he wrote most of the verse, and that the harangue of the guerrilla chief Rieux is sometimes attributed to him. The famous lines Sur la journée de Seulz, in which he commends the duc d'Aumale's ability in running away, is one of the most celebrated political songs in French. Towards the end of his life he became blind. He died in Paris on the 14th of September 1602.

See a notice by P. Blanchenain prefixed to his edition of Passerat's Poésies françaises (1880). Among his Latin works should be noticed Kalendio januario et saris quadam passuatu (2 vols., 1606), addressed personally to his friend and patron Henri Navarre. For the Satyre ménippe see the edition of Charles Read (1876).

PASSION (post-classical Lat. passio, formed from pati, passus, to suffer, endure), a term which is used in two main senses: (1) the suffering of pain, and (2) feeling or emotion. The first is chiefly used of the sufferings of Jesus Christ, extending from the time of the agony in the garden until his death on the cross. In this sense passio was used by the early Christian writers, and the term is also applied to the sufferings and deeds of saints and martyrs, synonymously with acta or gesta, a book containing such being known as a “passional” (liber passionalis) or
passionary" (passionarius). The order of Passionist Fathers, the full title of which is the "Congregation of the Discalced Clerks of the Most Holy Cross and Passion of our Lord Jesus Christ," was founded by St Paul of the Cross (Paolo della Croce, 1694-1775; canonized 1867) in 1720, but full sanction was not obtained for the order till 1737, when the first monastery was established at Monte Argentario, Orbetello. The secondary sense of "passion" is due to the late use of passio to translate the Greek philosophical term πάθος, the classical Latin equivalent being afectus. The modern use generally restricts the term to strong and uncontrolled emotion.

PASSIONFLOWER (Passiflora), the typical genus of the order to which it gives its name. The name passionflower—flos by the tendril, the side branches by flower-stalks, or the inflorescence may be reduced to a single stalk. The bracts on the flower-stalk are either small and scattered or large and leaty, and then placed near the flower, forming a sort of outer calyx or epicalyx. The flower itself (seen in section in fig. 2) consists of a receptacle varying in form from that of a shallow saucer to that of a long cylindrical or trumpet-shaped tube, thin or fleshy in consistence, and giving off from its upper border the five sepals, the five petals (rarely these latter are absent), and the threads or membranous processes constituting the "corona." This corona forms the most conspicuous and beautiful part of the flower of many species, and consists of outgrowths from the tube formed subsequently to the other parts, and having little morphological significance, but being physiologically useful in favouring the cross-fertilization of the flower by means of insects. Other outgrowths of similar character, but less conspicuous, occur lower down the tube, and their variations afford useful means of discriminating between the species. From the base of the inner part of the tube, the flower, but quite free from it, uprises a cylindrical stalk surrounded below by a small cup-like outgrowth, and bearing above it a ring of five flat filaments each attached by a thread-like point to an anther. Above the ring of stamens is the ovary itself, upraised on a prolongation of the same stalk which bears the filaments, or sessile.

**Fig. 1—**Passiflora Coerulea, showing Leaf with Stipules, Tendril, and detached Flower.

**Fig. 2.—**Flower of Passionflower cut through the centre to show the arrangement of its constituent parts.

The stalk supporting the stamens and ovary is called the "gynopode" or the "gynandrope," and is a characteristic of the order. The ovary of passionflowers is one-celled with three parietal placentas, and bears at the top three styles, each capped by a large button-like stigma. The ovary ripens into a berry-like, very rarely capsular, fruit with the three groups of seeds arranged in lines along the walls, but imbedded in a pulpy arillus derived from the stalk of the seed. This succulent berry is in some cases highly perfumed, and affords a delicate fruit for the dessert-table, as in the case of the "granadilla" (P. quadrangularis), *P. edulis*, *P. macrocarpa*, and various species of *Tasconia* known as "curubas" in Spanish South America; *P. laurifolia* is the water-lemon, and *P. maliformis* the sweet calabash of the West Indies. The fruits do not usually exceed in size the dimensions of a hen's or of a swan's egg, but that of *P. macrocarpa* is a gourd-like oblong fruit attaining a weight of 7 to 8 lb.

The tasconias, which in cultivation are generally regarded as distinct, differ from *Passiflora* in having a long cylindrical calyx-tube, bearing two crowns, one at the throat, the other near the base; they are stouter greenhouse plants; *T. pinactisstipula*, with pale rose-coloured flowers, a native of Chile and Peru, has long been in cultivation; *T. Van-Volxemii*, with handsome scarlet flowers, is one of the finest species.

PASSION WEEK, the fifth week in Lent, beginning with Passion Sunday (dominica passionis or de passione domini), so called from very early times because with it begins the more special commemoration of Christ's passion. Passion week is often incorrectly identified with Holy week (q.v.). In the north of England Passion Sunday was formerly known as Carle or Carling Sunday, a name corrupted from "care," in allusion to the sorrowful season which the day heralds. It was the universal custom in medieval England to eat on this Sunday a grey pea steeped and fried in butter, which came to be called from its association "Carling Nut."
PASSOVER, a Hebrew spring festival, celebrated by the Jews in commemoration of the exodus from Egypt by a family feast in the first month of the first year and by abstaining from leaven during the seven days of the feast. According to tradition, the first Passover ("The Passover of Egypt"), was preordained by Moses at the command of God. The Israelites were commanded to select on the tenth of Abib (Nisan) a he-lamb of the first year, without blemish, to kill it on the eve of the fourteenth and to sprinkle with its blood the lintel and sidepost of the doors of their dwellings so that the Lord should "pass over" them when he went forth to slay the first-born of the Egyptians. The lamb thus drained of blood was to be roasted and entirely consumed by the Israelites, who should be ready with loins girded, shoes on feet and staff in hand so as to be prepared for the exodus. In memory of this the Israelites were for all time to eat unleavened bread (matzoth) for seven days, as well as keep the sacrifice of the Passover on the eve between the fourteenth and the fifteenth of Nisan. This evening meal was not to be attended by any stranger or uncircumcised person. "On the morrow of the Sabbath" a wave offering of a sheaf of barley was to be made. Those who were unable to perform the sacrifice of the Passover over the impurity at the appointed time, were permitted to do so a month later.

Various theories have been from time to time proposed to account for this complex of enactments. J. Spencer in his De legisbus Hebraeorum saw in the Passover a practical protest against the Egyptian worship of Apis. Vatke considered it a celebration of the spring solstice, Baur a means of removing the impurity of the old year. Lengerke recognized a double motive: the lamb for atonement, the unleavened bread as a trace of the haste of the early harvest. Ewald regarded the Passover as an original pre-Mosaic spring festival made to serve the interest of purity and atonement.

All these views have, however, been cast in the shade by more recent investigations based on minute literary analysis of the Pentateuch, begun by Graf, continued by Kuenen, and culminating in the work of Wellhausen and Robertson Smith. This view claims to determine the respective ages and relative chronological position of the various passages in which the Passover is referred to in the Pentateuch, and assumes that each successive stratum represents the practice in ancient Israel at the time of composition, laying great stress upon omissions as implying non-existence. The main passages and their contents are arranged chronologically in the following way:

A. In the Elohist Book of the Covenant (Exod. xxiii.). The feast of unleavened bread to be kept seven days at the time appointed in the month of Abib.

B. In the Yahwist Source (Exod. xxxiv. 18-21, 25). The feast of unleavened bread to be kept seven days, &c. All firstlings to be the Lord's. First-born sons to be redeemed; none to appear before the Lord empty; six days' work, seventh day rest, in the harvest; the sacrifice of the Passover shall not remain until the morning.

C. In the Yahwistic History (Exod. xii. 21-27, 29-36, 38-39, xiii. 3-16). Moses summons the elders of Israel and orders them to kill the Passover and bring the blood of the lamb to the blood of the sin-offering. He sends the Israelites out of Egypt in haste, and the people took the dough before it was leavened upon kneading troubles on their shoulders.

D. In the Deuteronomist (Deut. xvi. 1-8, 16-17). Observe the month of Abib and keep the Passover because in that month God brought out the Israelites from Egypt. The sacrifice of the Passover of the flock and the herd shall be done in the place where God shall choose. In the seventh week, the Lord shall cause His name to be remembered; the seventh month shall be the feast of tabernacles, in which the people shall go to their tents and eat unleavened bread, on the seventh a solemn assembly. Reckon seven weeks from the time of putting the sicle to the standing corn.

E. In the Holiness Code (Lev. xxiii. 4-8, 9-14). The 14th of the first month at even is the Passover of the Lord; on the 15th of the same month is the feast of unleavened bread for seven days. First and seventh days shall be holy assembly, but a re-offering for seven days. On the morrow after the sabbath a wave offering and also a burnt offering of the he-lamb (with the corresponding meal and drink offering). Neither bread nor parched corn nor fresh ears shall be eaten until the ordinance is fulfilled; next day the Lord shall be observed in the altar.

F. In the Priestly History (Exod. xii. 1-20, 28-31, xiii. 1-2). On the 10th day of the month every household shall take a firstling male without blemish, of sheep or goat, and should kill it on the 14th, and sprinkle the blood on the lintel and sidepost with the blood, and eat the roasted flesh, not sodden, including head, legs and inwards; all remaining over until the morning to be burnt by fire. It should be eaten with loins girded, shoes on feet, and staff in hand. In case of an loose male it is slain; one that sees the blood He will pass over you and there will be no plague upon you. As a memorial of this shall you eat unleavened bread seven days, on the 14th day at eve until the 21st day at eve; when children shall ask what this service means, you shall say that it is the Passover of the Lord.

G. In the Secondary Sources of the Priestly Code (Exod. xii. 40-43, 45-50, x. 1-14, xiv. 16-25). No alien, sojourner or hired servant shall eat thereof, but a bought servant, if circumcised. It shall be in haste; none of the flesh shall be carried forth, neither shall a bone be broken. If a sojourner should wish to keep the Passover, all his male shall be circumcised and he will be as one born in the land. The Passover was kept in the first month on the 14th day, and the meat was to be roasted in skins, in the second month in skins and in the third month in vessels of earth; certain men, unclean by touching a dead body, asked what they should do; they were to keep it on the second month on the 14th day, eating it with unleavened bread and bitter herbs, laying the means of the Lord's deliverance of Israel out of Egypt. The first month on the 14th day of the month is the Passover; the 15th day of this month shall be a feast; seven days unleavened bread to be eaten; first day a holy assembly with fire offering, two rams, one bull and one lamb and seven firstlings of lambs without blemish, with appropriate meal offering and one he-goat for sin-offering; on the seventh day another holy assembly.

Many discrepancies have been observed among critics in the different portions of this series of enactments. Thus in the Elohist and in Deuteronomy the date of the festival is only vaguely stated to be in the month of Abib, while in the Holiness Code and in the Priestly History the exact date is given. In the Yahwist and Deuteronomist a solemn assembly is to be held on the seventh day, but in the Holiness Code and in the secondary sources of the Priestly Code both the first and the seventh day of the Feasts of Unleavened Bread are to be solemn assemblies. In the Deuteronomist the Passover sacrifice can be from either flock or herd, whereas in the Holiness Code only lamb is mentioned, and in the Priestly Code both lamb and bull. The sacrifice of the lamb is to be sodden or boiled, whereas in the Priestly Code this is expressly forbidden. A still more vital contrast occurs concerning the place of sacrificing the Passover; as enjoined in Deuteronomy this is to be by the males of the family at Jerusalem, whereas both in the presumably earlier Yahwist and in the latter Priestly Code the whole household joins in the festival which can be celebrated wherever the Israelites are settled. These discrepancies however are chiefly of interest in their bearing upon the problem of the Pentateuch, and really throw little light upon the origin of the two feasts connected together under the name of the Passover, to which the present remarks must be mainly confined. It may be observed however that the absence of a definite date in Deuteronomy must be accidental, since a common pilgrimage feast must be on a fixed day, and the reference to the seven weeks elapsing between Passover and Pentecost also implies the fixing of the date. So too even in the Elohist the time is appointed.

According to the origin and meaning of the feast, modern critics draw widespread attention to the different nature of the two observances combined with the name Passover, the pastoral sacrifice of the paschal lamb and the agricultural observance of a seven days' abstention from unleavened bread. It is assumed that the former arose during the pastoral period of Israelite history before or during thestay in Egypt, while the latter was adopted from the Canaanites after the settlement in Palestine. Against this may be urged that, according to the latest inquiries into the pastoral life, there is always connected with it some form of agriculture and a use of cereals, while, historically speaking, the Israelites while in Egypt were dependent on its corn. There is, further, the objection that no distinctive crisis in the agricultural era can be associated with the date of the Passover. The
The Feast of Unleavened Bread, now indissolubly connected with the paschal sacrifice, no satisfactory explanation has been given either of its original intention or of its connexion with the Passover. It has been suggested that it was originally a *hag* or pilgrimage feast to Jerusalem, of which there were three in the year connected with the agricultural festivals (Exod. xxxiv. 17, 18). But the real agricultural occasion was not the eating of unleavened bread but the offering of the first sheaf of the barley harvest on the "morrow of the sabbath" in the Passover week (Lev. xxiii. 10, 11), and this occasion determined the second agricultural festival, the Feast of Weeks, fifty days later (Deut. xvi. 9; Lev. xxiii. 16; see PENTECOST). The suggestion that the eating of cakes of unleavened bread, similar to the Australian "damper," was due to the exigencies of the harvest does not meet the case, since it does not explain the seven days and is incongruous with the fact that the first sheaf of the harvest was put to the sickle not earlier than the third day of the feast. It still remains possible therefore that the seven days' eating of unleavened bread (and bitter herbs) is an historical reminiscence of the incidents of the Exodus, when the normal commissariat did not begin until a week after the first exit. On the other hand, the absence of leaven may recall primitive practice before its introduction as a domestic luxury; sacrificial rites generally keep alive primitive custom. There was also associated in the Hebrew mind a connexion of impurity and corruption with the notion of leaven which was tabu in all sacrifice (Exod. xxiii. 18; Lev. ii. 11).

According to Robertson Smith, the development of the various institutions connected with the Passover was as follows. In Egypt the Israelites, as a pastoral people, sacrificed the firstlings of their flocks in the spring, and, according to tradition, it was a refusal to permit a general gathering for this purpose that caused the Exodus. When the Israelites settled in Canaan they found there an agricultural festival connected with the beginnings of the barley harvest, which coincided in point of date with the Passover and was accordingly associated with it. At the time of the reformation under Josiah, represented by Deuteronomy, the attempt was made to turn the family thank-offering of firstlings into a sacrificial rite performed by the priests in the Temple with the aid of the males of each household, who had to come up to Jerusalem but left the next morning to celebrate the Feast of Unleavened Bread in their homes. During the exile this was found impossible, and the old home ceremonial was revived and was kept up even after the return of the exile. This is a highly ingenious hypothesis to explain the discrepancies of the text, but is, after all, nothing but hypothesis.

There appears to have been originally considerable variety in the mode of keeping the Passover, but the earliest mention in the historical narratives (Josh. v. 11) connects the paschal sacrifice with the eating of unleavened bread. But it is unsafe to assume, from 2 Kings xxiii. 22, that the festival was not kept in the time of the early kings, since Solomon appears to have kept up the three great pilgrimage festivals, 2 Kings ix. 25, and it is possibly referred to in Isa. i. 9. The complex of observances connected with the Passover and the very want of observance in the literary sources would seem to vindicate the primitive character of the feast, which indeed is recognized by all inquirers.

At any rate the Samaritans have, throughout their history, observed the Passover with all its Pentateuchal ceremonial and still observe it down to the present day. They sacrifice the paschal lamb, which is probably the oldest religious rite that has been continuously kept up. In two important points they differ from later Jewish interpretation. The term "between the evenings" (Lev. xxiii. 5) they take as the time between sunset and dark, and the "morrow of the sabbath" (v. 11) they take literally as the first Sunday in the Passover week; wherein they agree with the Sadducees, Boethusians, Karaites and other Jewish sectaries. This would seem to point to a time when the fixing of the sabbath was determined by the age of the moon, so that the first day of the Passover, which is on the 15th of Nisan, would always occur on a sabbath.

beginning of barley harvest is however generally associated with it, while the wheat harvest is connected with Pentecost. The "sheaf of the first-fruits of your harvest," mentioned in Lev. xxiii. 10, is associated in Jewish tradition with the barley harvest (Mishna, Menachoth x). This, however, is not immediately connected with the Passover, and is of more significance as determining the exact date of Pentecost.

Considering however the two sections of the Passover separately, it is remarkable how many of the ceremonies associated either historically or ceremonially with the Passover have connexion with the idea of a covenant. The folk-etymology of the word Passover given in Exod. xii. 23 seems to connect the original of the feast with a covenantal idea. With the fact that no person joining in the meal should be uncircumcised connects the feast with the covenant of Abraham. Finally, the association of the first-born with the festival specially referred to in the texts, and carried out both in Samaritan tradition, which marks the forehead of the first-born with the blood of the lamb, and in Jewish custom, which obliged the first-born to fast on the day preceding Passover, also connects the idea of the feast with the sacro-sanctity of the first-born. The Hebrew tradition further connects the revelation of the sacred name of the God of the Hebrews with this festival, which thus combines, in itself, all the associations connecting the Hebrews with their God. It is not surprising therefore that Hebrew tradition connects it with the Exodus, the beginning of the theocratic life of the nation. It seems easiest to assume that the festival, so far as the Passover itself is concerned, was actually connected historically with the Exodus.

With regard to the abstention from leavened bread, the inquiry is somewhat more complicated. As before remarked, there seems no direct connexion between the paschal sacrifice and what appears to be essentially an agricultural festival; the Hebrew tradition, to some extent, dissociates them by making the sacrifice on the 14th of Nisan and beginning the Feast of Unleavened Bread on the 15th. This seeming casual connexion, to some extent, confirms the historic connexion suggested by the text, that the Jews at the Exodus had to use bread prepared in haste; but not even Hebrew tradition attempts to explain why the abstention should last for seven days. The attempt of modern critics to account for the period as that in which the barley harvest was gathered in, during which the workers in the field could not prepare leavened bread, is not satisfactory. The first-fruits of the barley harvest are to be gathered on the "morrow of the sabbath" (Lev. xxiii. 11). This expression has formed the subject of dispute between Samaritans and other sectaries and the Jews, the former of whom regard it as referring to the first Sunday during the festival, the latter as a special expression for the second day of the festival itself (see Hoffmann, Lev. xxiii. 5, who has taken the connexion of the festival with the harvest is only secondary.

The suggestion has been made by Wellhausen and Robertson Smith that the Passover was, in its original form, connected with the sacrifice of the firstlings, and the latter points to the Arabic annual sacrifices called *'Atair*, which some of the lexicographers interpret as firstlings. These were presented in the month Rajab, corresponding to Nisan (Smith, Religion of Semites, p. 210). But the real Arabic sacrifice of firstlings was called *Fara*; it might be sacrificed at any time, as was also the case with the Hebrews (Exod. xxii. 30). The paschal lamb was not necessarily a firstling, but only in the first year of its life (Exod. xii. 3). The suggestion of Wellhausen and Robertson Smith confuses the offering of firstlings (Arabic *Fara*) and that of the first yeanlings of the year in the spring (Arabic *'Atair*). It is possible that the Passover was originally connected with the latter (cf. Wellhausen, Reste arab. Heidentums, pp. 94 seq.). As regards
neutral power, the passport is a requisition by the government of the neutral state to suffer the vessel to pass freely with the crew, cargo, passengers, &c., without molestation by the belligerents. The requisition, when issued by the civil authorities of the port from which the vessel is fitted out, is called a sea-letter. But the terms passport and sea-letter are often used indiscriminately. A form of sea-letter (literae salvi conductus) is appended to the Treaty of the Pyrenees, 1659. The passport is frequently mentioned in treaties, e.g. the Treaty of Copenhagen, 1670, between Great Britain and Denmark. The violation of a passport, or safe-conduct, is a grave breach of international law. The offence in the United States is punishable by fine and imprisonment where the passport or safe conduct is granted under the authority of the United States (Act of Congress, April 30, 1790). In its more familiar sense a passport is a document authorizing a person to pass out of or into a country, or a licence or safe-conduct to the person specified therein and authenticating his right to aid and protection. Although most foreign countries may now be entered without passports, the English foreign office recommends travellers to furnish themselves with them, as affording a ready means of identification in case of need. They are usually granted by the foreign office of a state, or by its diplomatic agents abroad. The English Foreign Office charges two shillings for a passport, whatever number of persons may be named in it. Passports granted in England are subject to a stamp duty of sixpence.

They may be granted to naturalized as well as natural-born British subjects.

See "The Passport System," by N. W. Sibley, in Jour. Comp. Leg. new series, vol. vii. The regulations respecting passports issued by the English Foreign Office as well as the passport requirements of foreign countries will be found in the annual Foreign Office List.

PASTE (O. Fr. passe, modern pile, Late Lat. pasto, whence also in Span., Port. and It., from Gr. πασχων or παστο, barley pasture, reared, reared pasture, to sprinkle with salt), a mixture or composition of a soft plastic consistency. The term is applied to substances used for various purposes, as e.g. in cookery, a mixture of flour and water with lard, butter or suet, for making pies and pastry, or of flour and water boiled, to which starch or other ingredients to prevent souring are added, forming an adhesive for the affixing of wall-paper, bill-posting and other purposes. In technical language, the term is also applied to the prepared clay which forms the body in the manufacture of pottery and porcelain (see Ceramics) and to the specially prepared glass, known also as "strass," from which imitation gems are manufactured. This latter must be the purest, most transparent and most highly refractive glass that can be prepared. These qualities are comprised in the highest degree in a flint glass of unusual density from the large percentage of lead it contains. Among various mixtures regarded as suitable for strass the following is an example: powdered quartz, two parts, red lead, four parts (purified by alcohol) 163, borax 22, and white arsenic 1 part by weight. Special precautions are taken in the melting. The finished colourless glass is used for imitation diamonds; and when employed to imitate coloured precious stones the strass is melted up with various metallic oxides. Imitation gems are easily distinguished from real stones by their inferior hardness and by chemical tests; they may generally be detected by the comparatively warm sensation they communicate to the tongue.

PASTEL, the name of a particular method of painting with dry pigments, so called from the "past" into which they are first compounded. The invention of pastel, which used to be generally called "crayon," has frequently been accredited to Johann Alexander Thiele (1685-1752), landscape-painter and etcher of distinction, as well as to Mme Verney and Mlle Heid (1698-1753), both of Danzig. But "the claim cannot be substantiated, as drawing in coloured chalks had been practised long before, e.g. by Guido Reni (1575-1642), by Jordaens and Ruisdael. From a head and bust in this manner exists in the Dresden Gallery. Thiele was perhaps the first to carry the art to perfection, at least in Germany, where it was extensively exploited in the
17th century; but his contemporary, Rosalba Carriera of Venice (1675-1757), is more completely identified with it, and in her practice of it made a European reputation which to this day is in some measure maintained. The Dresden Museum contains 157 examples of her work in this medium, portraits, subjects and the like. Thiele was followed by Anton Raphael Mengs (1728-1779) and his sister Theresa Mengs (afterwards Maron, 1725-1806), and by Johann Heinrich Schmidt (1740-1820).

When in 1720 Rosalba Carriera accepted an invitation to visit Paris, where she was received with general enthusiasm, she found the art of pastel-painting well established; that is to say, it was used to reproduce local colour with truth. She made it fashionable and combined truth with nature. Nearly a hundred years before Claude Lorrain had used coloured chalks as Dutch and Italian painters had used them, often with high finish, employing mainly red, blue and black, for the sake of prettiness of effect and not with the intention of reproducing with accuracy the actual colours of the head, the figure, or the landscape before them. This method of making drawings—rehaussgt, as they were called—has remained in common use almost to the present day, especially for studies. It is necessary only to cite among many examples the series of heads of Voltaire, the highly esteemed portrait painter, by Girodet, those by Raphael Smith and Sir Thomas Lawrence, to indicate how general has been the employment of the coloured chalk. In 1747 Nattier (1685-1766) showed a pastel portrait of M. Logerot in the Paris Salon, and his son-in-law, Louis Tocqué (1666-1772), soon followed with similar work. Hubert Drouais (1699-1767) had preceded his rival Nattier in the Salon by a single year with five pastel portraits, and Chardin (1699-1770) followed in 1771. This great master set himself to work in emulation of Quentin de la Tour (1704-1788), who in spite of the ability of his rivals may be regarded as the most eminent pastellist France has produced. His portraits of Mme Boucher and himself appeared in the Salon in 1737; his full strength as a portrait-pastellist is to be gauged in the collection of eighty-five of his principal works now in the museum of St Quentin. Then followed Simon Mathurin Lantara (1729-1778), who was one of the first to paint pastel-pictures of landscapes, including sunsets and moonlights, as well as marines, into which the figures were drawn by Joseph Vernet, Casanova and others, and Jean Baptiste Perronneau (1733-1790), whose heads have been attributed to de la Tour and whose "Jeune fille au chat" in the Louvre, though not the finest, is perhaps the best known of his works, was the last pre-eminent French pastellist of the 18th century. Since then they have been legion; of these it is needful to mention only Girodet and the flower-painters, Jean Saint-Simon and Sperandonck.

Two Swiss painters had considerable influence in spreading the use of pastel—the experimentalist Dietrich Meyer (1572-1658), one of the first to make designs in coloured chalks (and reputed inventor of soft-ground etching), and Jean Etienne Lavergne (1702 or 1704-1758), one of the most brilliant pastellists who ever lived. Two of his works are word-famous, "La Belle Chocolatire de Vienne," executed in 1745, now in the Dresden Museum, and "La Belle Lieuse," of the following year at the museum at Amsterdam. The latter is a portrait of his niece, Mlle Laveragne. In 1753, and again in 1772, Lavergne visited England, where his brilliant work, portraits and landscapes, produced a great effect, almost equal to that of de la Tour twenty years before. The Royal Academy of Arts bestowed medals and portraits of Dr Thomson, himself, Lord Duncan and General Cholmondley.

Crayon-painting was practised in England at an early date, and John Riley (1646-1691), many of whose finest works are attributed to Sir Peter Lely, produced numerous portraits in that medium. Francis Knapton (1608-1778), court painter, was a more prolific master, and he, with William Hoare of Bath (1707-1792) who had studied pastel in Italy and made many classic designs in that medium, exhibiting at the Royal Academy his "Boy as Cupid," "Prudence instructing her Pupil," "Diana," "A Zingara," and others, prepared the way for the triumph of Francis Cotes (1725-1770). Then for the first time pastel-painting was fully developed by an English hand. Before he became a painter in oil Cotes had worked under Rosalba Carriera, and, although he was rather cold and chalky in his tones, he produced portraits, such as his "Mr and Mrs John Bates" and "Lord Hawke," which testify to his high ability. He was, however, far surpassed by his pupil, John Russell, R.A. (1745-1806), who brought the art to perfection, displaying grace and good expression in all his pastel work, whether portrait, fancy picture, historical subject, or "conversation-piece." He had brought from Rosalba her four fine pictures representing "The Seasons," and in a great measure founded his style on them. He was strong and brilliant in colour, and when he was at his best his high, smooth finish in no way robbed his work of vigour. Romney (1734-1802) in his single pastel portrait, a likeness of William Cowper the poet, showed that he might have excelled in this medium, which, indeed, was particularly suited to his tenor manner. Hugh D. Hamilton (c. 1734-1806) of the Royal Hibernian Academy, produced noteworthy portraits, mainly in grey, red and black, until on the suggestion of Plaxman he abandoned pastel for oil. Oziis Humphry, A.R.A. (1742-1810), painter and miniaturist, is an important name among the pastellists, commonly believed to have been in England who made a point of letting his colour strokes be seen (as by Emile Wauters and others in our own day), contrary to the practice of Russell and his predecessors, whose prime effort was to blend all into imperceptible gradations. Richard Cosway, R.A. (1742-1821) was mainly experimental in his pastels, but his portraits, such as that of George prince of Wales, are forcible and brilliant; those of his wife Maria Cosway (1750-1838) are more delicate. Daniel Gardner (?1750-1805), whose pictures in oil have often been mistaken for Reynolds's and Gainsborough's, gave rein to his exuberant fancy and his rather exaggerated taste in compositions which, in his arrangement of children, remind us of Sir Thomas Lawrence in his more fantastic mood. Gardner marked the deterioration of the art, which thereafter declined, Henry Bright (1814-1873) being almost the only pastellist of real power who followed him. Bright's landscapes have probably in their own line never been surpassed.

Since 1870 there has been a revival of the art of pastel, the result of a better understanding and appreciation on the part of the public. Grimm's depictions of his time are not the only one is agreed that pastel is unworthy the office of a great painter—which for many years had found general acceptance, is now seen to have been based on forgetfulness or ignorance of the virtues inherent in the method. It was thought that "coloured chalks," as it used to be called in English-speaking countries, promised nothing but sketches of an ephemeral kind, so fragile that they were at the mercy of every chance blow or every touch of dampness. The fact is, that with care no greater than is accorded to every work of art, pastel properly used is not more perishable than the oil-painting or the water-colour. Damp will affect it seriously, but so also will it ruin the water-colour; and rough usage is to be feared for the oil-picture not less than for the pastel. Moreover, pastel possesses advantages that can be claimed by neither oil-painting nor water-colour. That is to say, if pictures in these three mediums be hung side by side for a hundred years in a fair light and in a dry place, the oil-painting will have darkened and very probably have cracked; the water-colour will have faded; but the pastel will remain as bright, fresh, and pure as the day it was painted. If Time and Varnish, which Hogarth and Millais both declared the two greatest of the old masters, will do nothing to "improve" a pastel, neither will they ruin it—time passes by it and varnish must on no account be allowed to approach it. The pastel-painter, therefore, having no adventitious assistance to hope for, or to fear, must secure at once the utmost of which his method is capable.

The advantages of pastel are threefold: those of working, those of results, and those of permanence. The artist has at his command, without necessity of mixing his colours, every hue to be found in nature, so that freshness and luminosity can
always be secured without fear of that loss of brilliancy commonly attendant on the mixing of colours on the palette. Moreover, the fact of pastel being dry permits the artist to leave his work and take it up again as he may choose; and he is free from many of the technical troubles and anxieties natural to oil and water-colour painting. Applied with knowledge, pastel, which has been likened for delicacy of beauty to “the coloured dust upon the velvet of butterflies’ wings,” will not fall off. It can, if desired—though this is hardly necessary or desirable—be “fixed,” most commonly by a fixatif. If intending so to treat his work, the artist must paint in a somewhat lighter key, as the effect of the fixing medium is slightly to lower the general tone. The fixatif Lacoste is considered the best, but the general consensus of opinion among artists is against the use of any such device. This preparation has the advantage of leaving the colour unchanged, even though it dulls it; shellac fixatif has the effect of darkening the work.

The inherent qualities of pastel are those of charm, of subtlety, softness, exquisite depths of tone, unsurpassable harmonies and unique freshness of colour, sweetness, delicacy, mystery—all the virtues sought for by the artist of daintiness and refinement, all the properties of that essential, yet intangible, matter, the colourist. Now, these very qualities suggest its limitations. Although it is unfair to relegate it—as fashion has foolishly done for so long—to the bunch of pretty triflings which Carlyle called “Pompadourisms,” we must recognize that a medium which suggests the bloom upon the peach is not proper to be employed for rendering “grand,” or even genre subjects, or for the covering of large surfaces of canvas. It is inappropriate to the painting of classic compositions, although in point of fact it has been so used, without success. It is best adapted to the rendering of still life, of landscape and of portraiture. But in these cases it is not advisable to aim at that solidity which is the virtue of oil-painting, if only because oil can bring about a better result. The real reason is that, in securing solidity, pastel tends to forfeit that lightness and grace which constitute its special charm and merit. Strength belongs to oil, tenderness and subtlety to pastel, together with freshness and elegance.

The pre-eminent technical advantage, in addition to those already mentioned, is the permanence of the tones. In water-colours there is an admixture of gum and glycerine which may attract moisture from the air; and, besides, the pigment is used in very thin washes. In oil-painting not only does the oil darken with age but sometimes draws oxygen from a pigment and changes its hue. In pastel the colour is put on without any moist admixture, and can be laid on thick. Moreover, the permanence may arise from the method of manufacture. In a very rare work, The Excellency of the Pen and Pencil (1668), a chapter on “how to make pastils” [sic] “of several colours, for drawing figure, landskip, architecture, &c., on blew paper,” describes the manner of grinding up the pigments with grease. This used to be the secret of pastel—that every grain of colour was separately and securely locked up in grease, and so was secured from any chemical change that might have come about through contact of the colours with one another or with the atmosphere. With pastel nothing of the kind could occur; and the works of Rosalba Carriera in Italy, of Quentin, Peronneau, Watteau, St. Jean, Paul Hoin and Chardin in France, and of Russell and Cotes in England—to name no others—testify to the permanency of the colours. Some manufacturers nowadays employ gum as the binding medium; others beeswax (which at one time was more frequently used than it is at present); others, again, a very small proportion of tallow, and sometimes a little soap. But this introduction of binding media is now adopted only in the case of certain colours. Whether the point or edge of the stick be used (as in pastel drawing), or the side of it, helped with the tips of the fingers (as in pastel painting), the result is equally permanent; and if, when the work is done, it be struck two or three times, and then touched up by hand-crays, no dropping of colour from the paper need ever occur. The drawing is made on a grained paper that will hold the chalk, or on a specially manufactured toothed cloth. The French paper known as gras gris bleuté is frequently employed by ceramists and engravers. The crisp touches of the pastel can be placed side by side, as “the artist seeks may be obtained by glazes and superposed tones. It should here be mentioned that about the year 1800 M. Jean-François Raffaelli produced in Paris sticks of oil colours which he declared would in a great measure replace painting with the brush. Although the system was widely tried and many good pictures painted in this method, it was found that the colours became dull, and such vogue as these “solid paints” enjoyed for a time has to a very great extent disappeared.

The art of pastel, as M. Roger Ballu expressed it, “was slumbering a little,” until in 1870 the Société des Pastellistes was founded in Paris and met with ready approval. Many artists it was a matter of “coloured chalks,” as, for example, Adrien Moreau, Nymius, Miellet and Degas in France, and with Whistler in England. With the majority the full possibilities were seized, and a great number of artists moulded the pastel for the sake of colour, among whom may be mentioned Adrien Moreau, A. B. Word, Émile Levy, Machard, Pointelin, Georges Picard, de Nittis, Iwli, René Billotte, Jozan, Noël, Raffaelli, Brochard (mainly upon vellum) and Lévy-Dhurmer in France; in Belgium, Émile Wauters (who has produced a great work with pastel) and Auguste Raffaelli (of amazing strength, vitality and completeness) and Fernand Khnopff; in Italy, C. Laurenti, P. Fragiaco and Giovanni Segantini; in Holland, Josselin de Jong; in Germany, F. von Lenbach, Max Liebermann, and W. Rentz. L’Artiste in London for 1885 mentions the beauty and finish of pastel and its success in reproduction by wood-engraving.

In England the revival of pastel dates from 1880, when the first exhibition of the Pastel Society was held in the Grosvenor Gallery. The exhibition was a succès d’estime, but while a few society languaged until, in 1890, it was reconstituted, and obtained the adhesion of many of the most distinguished artists practising in the country, as well as a score of eminent foreign painters. In that year, and since, it has held exhibitions of a high order; and intelligent appreciation has been directed to the work of the most noteworthy contributors. Among these are E. A. Abbey, R.A.; M’Lure Hamilton, J. M. Swan, R.A.; J. Lorimer, R.S.A.; A. Peppercock, R. Anning Bell, J. J. Shannon, R.A.; Sir James Guthrie, R.A., Sir W. Russell, R.A., Sir Edward Stott, R.A.; A. S. Solomon, R.A.; and W. Rothwell.

enabling him to become candidate for the École normale. But here something (probably) was at fault, for a note was attached to Pasteur's diploma stating that he was only "mediocre" in chemistry. In those early days and early trials the dominant note of Pasteur's life was sounded. To his sisters he writes: "Ces trois choses, la volonté, le travail, le succès, se partagent toute l'existence humaine. La volonté ouvre la porte aux carrières brillantes et heureuses; le travail les franchit, et une fois arrivé au terme du voyage, le succès vient couronner l'œuvre." Throughout his life, and to the very end, "work" was his constant inspiration. On his deathbed he turned to the devoted pupils who watched over their master's last hours. "Où en êtes-vous?" he exclaimed. "Qu'êtes-vous?" and ended by repeating his favourite words, "Il faut travailler."

The first incentive to his serious study of chemistry was given by hearing J. B. A. Dumas lecture at the Sorbonne; and ere long he broke new ground for himself, A. J. Bécard, having given him an opportunity for chemical work by appointing him to the post of laboratory assistant. A few words of explanation on turning to Pasteur's first research are necessary to give the key to all his future work. What was the secret power which enabled him to bring under the domain of scientific laws phenomena of disease which had so far baffled human endeavour? It simply consisted in the application, to the elucidation of these complex problems, of the exact methods of chemical and physical research. Perhaps the most remarkable discovery of modern chemistry is the existence of compounds, which, whilst possessing an identical composition, are absolutely different bodies, judged of by their properties. The first of the numerous cases of isomerism now known was noted, but unexplained, by J. J. Berzelius. It was that of two tartaric acids, deposited from wine-lees. The different behaviour of these two acids to a ray of polarized light was subsequently observed by J. B. Biot. One possessed the power of turning the plane of the polarized ray to the right; the other possessed no rotary power. Still no explanation of this singular fact was forthcoming, and it was reserved for the young chemist from Franche-Comté to solve a problem which had baffled the greatest chemists and physicists of the time. Pasteur proved that the inactivity of the one acid depended upon the fact that it was composed of two isomeric constituents: one the ordinary or dextrorotatory acid, and the other a new acid, which possessed an equally powerful left-handed action. The veteran Biot whose acquaintance Pasteur had made, was incredulous. He insisted on the repetition of the experiment in his presence; and when convinced of the truth of the explanation he exclaimed to the discoverer: "Mon cher enfant, j'ai tant aimé les sciences dans ma vie que cela me fait battre le cœur." Thus at one step Pasteur gained a place of honour among the chemists of the day, and was immediately appointed professor of chemistry at the Faculté de Science at Strasbourg, where he soon afterwards married Milie Laurent, who proved herself to be a true and noble helpmeet. Next he sought to prepare the inactive form of the acid by artificial means; and after great and long-continued labour he succeeded, and was led to the commencement of his classical researches on fermentation, by the observation that when the inactive acid was placed in contact with a special form of fungus (Penicillium glaucum) the right-handed acid alone was destroyed, the left-handed variety remained unchanged. So well was his position as a leading man of science now established that in 1854 he was appointed professor of chemistry and dean of the Faculty des Sciences at Lille. In his inaugural address he used significant words, the truth of which was soon manifested in his case: "In the field of observation chance only favours those who are prepared." The diseases or sicknesses of beer and wine had from time immemorial baffled all attempts at cure. Pasteur one day visited a brewery containing both sound and unsound beer. He examined the yeasts under the microscope, and at once saw that the globules from the sound beer were nearly spherical, whilst those from the sour beer were elongated; and this led him to a discovery, the consequences of which have revolutionized chemical as well as biological science, inasmuch as it was the beginning of that wonderful series of experimental researches in which he proved conclusively that the notion of spontaneous generation is a chimera. Up to this time the phenomenon of fermentation was considered strange and obscure. Explanations had indeed been put forward by men as eminent as Berzelius and Liebig, but they lacked experimental foundation. This was given in the most complete degree by Pasteur. For he proved that the various changes occurring in the several processes of fermentation—as, for example, in the vinous, where alcohol is the chief product; in the acetic, where vinegar appears; and in the lactic, where milk turns sour—are invariably due to the presence and growth of minute organisms called ferments. Exclude every trace of these organisms, and no change occurs. Brewers' wort remains unchanged for years, milk keeps permanently sweet, and these and other complex liquids remain unaltered when freely exposed to air from which all these minute organisms are removed. "The chemical act of fermentation," writes Pasteur, "is essentially a correlative phenomenon of a vital act beginning and ending with it."

But we may ask, as Pasteur did, Why does beer or milk become sour? Is exposure to ordinary air? Are these invisible germs which cause fermentation born in the atmosphere or are they not generated from the organic, but then organized, constituents of the fermentable liquid? In other words, are these organisms not spontaneously generated? The controversy on this question was waged with spirit on both sides; but in the end Pasteur came off victorious, and in a series of the most delicate and most intricate experimental researches he proved that when the atmospheric germs are absolutely excluded no changes take place. In the interior of the grape, in the healthy blood, in such germs exist; crush the grape, wound the flesh, and expose them to the ordinary air, then changes, either fermentative or putrefactive, run their course. But place the crushed fruit or the wounded animal under conditions which preclude the presence or destroy the life of the germ, and again no change takes place; the grape juice remains sweet and the wound clean. The application of these facts to surgical operations, in the able hands of Lord Lister, was productive of the most beneficial results, and has indeed revolutionized surgical practice.

Pasteur was not the acknowledged head of the greatest chemical movement of the day. He had given to the world of honours both from his own country and abroad, and installed at the École normale in Paris in a dignified and important post. Not, however, was it without grave opposition from powerful friends in the Academy that Pasteur carried on his work. Biot—who loved and admired him as a son—publicly announced that his enterprise was chimerical and the problem insoluble; Dumas evidently thought so too, for he advised Pasteur not to spend more of his time on such a subject. Yet he persevered: "Travailler, travailler toujours" was his motto, and his patience was rewarded by results which have not merely rendered his name immortal, but have benefited humanity in a way and to a degree for which no one could have ventured to hope. To begin with a comparatively small, though not unimportant, matter, Pasteur's discoveries on fermentation inaugurated a new era in the brewing and wine-making industries. Empiricism, hitherto the only guide, if indeed a guide at all, was replaced by scientific knowledge; the connexion of each phenomenon with a controllable cause was established, and rule-of-thumb and quackery banished for ever by the free gift to the world of the results of his researches.

But his powers of patient research and of quick and exact observation were about to be put to a severe test. An epidemic of a fatal character had ruined the French silk producers. Dumas, a native of the Alais district, where the disease was rampant, urged Pasteur to undertake its investigation. Up to that time he had never seen a silkworm, and hesitated to attempt so difficult a task; but at the reiterated request of his friend he consented, and in June 1865 went to the south of France for the purpose of studying the disease on the spot. In September of the same year he was able to announce results which pointed to
PASTICCIO—

The means of securing immunity from the dreaded plague. The history of this research, of the gradual elimination of the unimportant conditions, of the recognition of the disease, is one of the most fascinating chapters of scientific discovery. Suffice it here to say that careful experiment and accurate observation succeeded in ascertaining the cause of the disease and in preventing its recurrence, thus bringing back to prosperity the silk trade of France, with all that this entails.

"There is no greater charm," says Pasteur, "for the investigator than to make new discoveries; but his pleasure is heightened when he sees that they have a direct application to practical life." Pasteur had the good fortune, and just reward, of seeing the results of his work applied to the benefit both of the human race and of the animal world. It is to him that the world is indebted for the introduction of methods which have already worked wonders, and bid fair to render possible the preventive treatment of all infectious diseases. Just as each kind of fermentation possesses a definite organized ferment, so many diseases are dependent on the presence of a distinct microbe, and just as the gardener can pick out and grow a given plant or vegetable, so the bacteriologist can (in most cases) eliminate the adventitious and grow the special organism—in other words, can reduce the disease to a condition which has the power of bringing about the special disease. But by a process of successive and continued artificial cultures under different conditions, the virus of the organism is found to become attenuated; and when this weakened virus is administered, the animal is rendered immune against further attacks. The first disease investigated by Pasteur was that of chicken cholera, an epidemic which destroyed 10% of the French fowls; after the application of the preventive method the death-rate was reduced to below 1%. Next came the successful attempt to deal with the fatal cattle scourge known as anthrax. This is also caused by the presence of a microbe, of which the virus can also be attenuated, and by inoculation of this weakened virus the animal rendered immune. Many millions of sheep and oxen all over the world have thus been treated, and the rate of mortality reduced from 10 to less than 1%. As to the money value of these discoveries, T. H. Huxley gave it as his opinion that it was sufficient to cover the whole cost of the war indemnity paid by France to Germany in 1870.

The most interesting of Pasteur's investigations in preventive and curative medicine remains to be told. It is no less than a cure for the dread disease of hydrophobia in man and of rabies in animals; and the interest of the achievement is not only that he successfully combated one of the most mysterious and most fell diseases to which man is subject, but also that this was accomplished in spite of the fact that the special microbe causing the disease had not been isolated. To begin with, Pasteur, in studying the malady in dogs, came to the conclusion that the virus had its seat in the nerve centres, and he proved that the injection of a portion of the matter of the spinal column of a rabid dog into the body of a healthy one produces in the latter with certainty the symptoms of rabies. The next step was to endeavour so to modify and weaken the virus as to enable it to be used as a preventive or as an antitoxin. This, after long and serious labour, he effected; the dog thus inoculated proved to be immune when bitten by a rabid animal. But this was not enough. Would the inoculation of the attenuated virus have a remedial effect on an animal already bitten? If so, it might be possible to save the lives of persons bitten by mad dogs. Here again experiment was successful. A number of dogs were inoculated, the same number were untreated, and both sets were bitten by rabid animals. All the treated dogs lived; all the untreated died from rabies. It was, however, one thing to experiment on dogs, and quite another to do so on human beings. Nevertheless Pasteur was bold enough to try. The trial was successful, and by doing so he earned the gratitude of the human race. Then, on the 14th of November 1888, the Institut Pasteur was founded. Thousands of people suffering from bites from rabid animals, from all lands, have been treated in this institute, and the death-rate from this most horrible of all diseases has been reduced to less than 1%. Not only in Paris, but in many cities throughout the world, institutes on the model of the original one have been set up and are doing beneficent work, all arising from the genius and labour of one man. At the inauguration of the Institute Pasteur closed his oration with the following words:

"Two opposing laws seem to me now in contest. The one, a law of blood and death, opening out each day new modes of destruction, forces nations to be always ready for the battle. The other, a law of peace, work and health, whose only aim is to deliver man from the calamities which beset him. The one seeks violent conquests, the other the relief of mankind. The one places a single life above all victories, the other sacrifices hundreds of thousands of lives to the ambition of a single individual. The law of which we are the instruments strives even through the carnage to cure the wounds due to the law of war. Treatment by our antiseptic methods may preserve the lives of thousands of soldiers. Which of these two laws will prevail, God only knows. But of this we may be sure, that science, in obeying the law of humanity, will always labour to enlarge the frontiers of life."

Rich in years and in honours, but simple-minded and affectionate as a child, this great benefactor to his species passed quietly away near St Cloud on the 28th of September 1895.

Mention need only be made of Pasteur's chief works, as follows: Études sur le vin (1866), Études sur le vinaigre (1868), Études sur la maladie des vers à soie (1870), Études sur la bière (1876). He began the practice of inoculation for hydrophobia in 1885. See Vie de Pasteur, by René Vallery-Radot (Paris, 1900).

PASTICcio, an Italian word, now often Englished as "pastiche," formed from pasta, paste, for a composition in music, painting or other arts, made up of selections from fragments or imitations of the work of other artists, a medley or pot-pourri. The term has also been applied to a form of musical composition in which selections from various operas, &c., are pieced together to form a consecutive whole, special librettos being sometimes written for them.

PASTO, a city of Colombia and capital of the department of Nariño, about 36 m. from the boundary line with Ecuador, on the river Patía; is the only inland town to have a principal line of communication with the great forested regions of the Caquetá (Japurarú), Putumayo and Napo. Pop. (1906 estimate), 6000. It stands on an elevated plain, 8347 ft. above the sea, at the eastern foot of the Pasto volcano, which rises above the city to a height of 13,900 ft. Wool is produced to some extent and is woven for the local market in the woollen factories of Pasto.

PASTON LETTERS, an invaluable collection of letters and papers, consisting of the correspondence of members of the Paston family, and others connected with them, between the years 1422 and 1590, and also including some state papers and other important documents. The bulk of the letters and papers were sold by William Paston, 2nd earl of Yarmouth, the last representative of the family, to the antiquary Peter Le Neve early in the 18th century. On Le Neve's death in 1729 they came into the possession of Thomas Martin of Pulgrave, who married his widow; and upon Martin's death in 1771 they were purchased by John Worth, a chemist at Diss, whose executors sold them three years later to John Fenn of East Dereham. In 1787 Fenn published a selection of the letters in two volumes, and general interest was aroused by this publication. In 1789 Fenn published two other volumes of letters, and when he died in 1794 he had prepared for the press a fifth volume, which was published in 1835 by his nephew, Serjeant Frere. In 1787 Fenn had received a knighthood, and on this occasion, the 23rd of May, he had presented the originals of his first two volumes to King George III. These manuscripts soon disappeared, and the same fate attended the originals of the three other volumes. In these circumstances it is not surprising that some doubt should have been cast upon the
authenticity of the letters. In 1865 their genuineness was impugned by Herman Merivale in the Fortnightly Review; but it was vindicated on grounds of internal evidence by James Gairdner in the same periodical; and within a year Gairdner's contention was established by the discovery of the originals of Fenn's fifth volume, together with other letters and papers, by Serjeant Frere's son, Philip Frere, in his house at Dungate, Cambridgeshire. Ten years later the originals of Fenn's third and fourth volumes, with ninety-five unpublished letters, were found at Roydon Hall, Norfolk, the seat of George Frere, the head of the Frere family; and finally in 1889 the originals of the two remaining volumes were discovered at Orwell Park, Ipswich, the residence of Captain E. G. Pretyman. This latter batch of papers are the letters which were presented to George III., and which possibly reached Orwell through Sir George Pretyman Tomline (1750-1827), the tutor and friend of William Pitt.

The papers which had been in the hands of Sir John Fenn did not, however, comprise the whole of the Paston letters which were extant. When the 2nd earl of Yarmouth died in 1732 other letters and documents relating to the Pastons were found at his seat, Oxnead Hall, and some of these came into the hands of the Rev. Francis Blomefield, who failed to carry out a plan to unite his collection with that of Martin. This section of the letters was scattered in various directions, part being acquired by the antiquary John Ives. The bulk of the Paston letters and documents are now in the British Museum; but others are at Orwell Park; in the Bodleian Library, Oxford; at Magdalen College, Oxford; and a few at Pembroke College, Cambridge.

Fenn's edition of the Paston Letters held the field until 1872, when James Gairdner published the first volume of a new edition. Taking Fenn's work as a basis, the aim of the new editor was to include all the letters which had come to light since this publication, and in his careful and accurate work in three volumes (London, 1872-1875) he printed over four hundred letters for the first time. Gairdner's edition, with notes and index, also contained a valuable introduction to each volume, including a survey of the reign of Henry VI.; and he was just completing his task when the discovery of 1872 was made at Roydon. An appendix gave particulars of this discovery, and the unprinted letters were printed as a supplement to subsequent editions. In 1904 a new and complete edition of the Paston Letters was edited by Gairdner, and these six volumes, containing 1088 letters and papers, possess a very valuable introduction, which is the chief authority on the subject.

The family of Paston takes its name from a Norfolk village about twenty miles north of Norwich, and the first member of the family about whom anything is known was living in this village early in the 15th century. This was one Clement Paston (d. 1419), a peasant, holding and cultivating about one hundred acres of land, who gave an excellent education to his son William, and enabled him to study law. Making good use of his opportunities, William Paston (1378-1444), who is described as "a right cunning man in the law," attained an influential position in his profession, and in 1420 he married Agnes the daughter and heiress of Sir Edmund Berry of Harlingbury, Hertfordshire. Consequently when he died he left a large and valuable inheritance to John Paston (1421-1466), the eldest of his five sons, who was already married to Margaret (d. 1484), daughter of John Mauteby of Mauteby. At this time England was in a very distracted condition. A weak king surrounded by turbulent nobles was incapable of discharging the duties of government, and only the strong man armed could hope to keep his goods in peace. A lawyer like his father, Paston spent much time in London, leaving his wife to look after his business in Norfolk; and many of the Letters were written by Margaret to her husband, detailing the progress of affairs in the county. It is during the lifetimes of John Paston and his eldest son that the Letters are most numerous and valuable, not only for family matters, but also for the history of England. It is the period of John Paston's residence in London when his eldest son the Letters are most numerous and valuable, not only for family matters, but also for the history of England. In 1448 Paston's manor of Gresham was seized by Robert Hungerford, Lord Moleyns (1432-1464), and although it was afterwards recovered, the owner could obtain no redress for the loss and injury he had sustained. More serious troubles, however, were at hand. Paston had become very intimate with the wealthy knight, Sir John Fastolf, who was probably related to his wife, and who had employed him on several matters of business. In 1459 Sir John died without children, leaving his affairs in a tangle of condition. In accordance with the custom of the time, he had conveyed many of his estates in Norfolk and Suffolk to trustees, among whom were John Paston and his brother William, retaining the revenues for himself, and probably intending his trustees after his death to devote the property to the foundation of a college. However, it was found that a few days before his decease Fastolf had executed a fresh will in which he had named ten executors, of whom two only, John Paston and another, were to act; and, moreover, that he had bequeathed all his lands in Norfolk and Suffolk to Paston, subject only to the duty of founding the college at Caister, and paying 4000 marks to the other executors. At once taking possession of the lands, Paston soon found his rights challenged. Various estates were claimed by different noblemen; the excluded executors were angry and aggressive; and Paston soon found himself in a whirlwind of litigation, and exposed also to more violent methods of attack. Something like a regular warfare was waged around Drayton and Hellesdon between John de la Pole, duke of Suffolk, and the Pastons under Margaret and her eldest son, John; Caister Castle was seized by John Mowbray, 3rd duke of Norfolk (d. 1461); and similar occurrences took place elsewhere. Some compensation, doubtless, was found in the fact that in 1460, and again in 1461, Paston had been returned to parliament as a knight of the shire for Norfolk, and enjoying the favour of Edward IV., he regained his castle at Caister. But the royal favour was only temporary, and, having been imprisoned on three occasions, Paston died in May 1466, leaving the suit concerning Fastolf's will still proceeding in the church courts. John Paston left at least five sons, the two eldest of whom were, curiously enough, both named John, and the eldest of whom had been knighted during his father's lifetime. Sir John Paston (1442-1479) was frequently at the court of King Edward IV., and afterwards he favoured the Lancastrian party, and, with his brother John, fought for Henry VI. at the battle of Barnet. Meanwhile the struggle over Fastolf's estates continued, although in 1461 the king and council had decided that Paston's ancestors were not bondmen, and consequently that his title to his father's lands was good. Caister Castle was taken after a regular siege by John Mowbray, 4th duke of Norfolk (1444-1476), and then recovered by the Pastons, and retaken by the duke. But in 1474 an arrangement was made with William Waynflete, bishop of Winchester, the representative of the excluded executors, by which some of the estates were surrendered to the bishop for charitable purposes, while Paston was secured in the possession of others. Two years later the opportunity death of the duke of Norfolk paved the way for Paston to claim his heritage. A fresh quarrel broke out with the duke of Suffolk. Sir John, who was a cultured man, had shown great anxiety to recover Caister; but in general he had left the conduct of the struggle to his mother and to the younger John. Owing to his carelessness and extravagance the family lands were also diminished by sales; but nevertheless when he died unmarried in November 1470 he left a goodly inheritance to his brother John. About this time the Letters begin to be scanty and less interesting, but the family continued to flourish. The younger John Paston (d. 1503), after quarrelling with his uncle William over the manors of Oxnead and Marlberg, was knighted at the battle of Stoke in 1487. He married Mergery, daughter of Sir Thomas Brews, and left a son, William Paston (c. 1479-1534), who was also knighted, and who was a prominent figure at the court of Henry VIII. Sir William's second son, Clement (c. 1515-1557), served his country with distinction on the sea, and was wounded at the battle of Pinnace. The family was continued by Sir William's eldest son, Erasmus (d. 1540), whose son William succeeded to his grandfather's
estates in 1554, and to those of his uncle Clement in 1597. This William (1528-1610) was knighted in 1578. He was the founder of the Paston grammar-school at North Walsham, and made Oxnead Hall, near Norwich, his principal residence. Christopher Paston was Sir William's son and heir, and Christopher's grandson, William (d. 1663), was created a baronet in 1642; being succeeded in the title by his son Robert (1631-1683), who was a member of parliament from 1661 to 1673, and was created earl of Yarmouth in 1679. Robert's son William (1652-1732), who married a natural daughter of Charles II., was the second earl, and, like his father, 'was in high favour with the Stuarts. When he died in 1732 he left no son, and his titles became extinct, his estates being sold to discharge his debts.

The perturbed state of affairs revealed by the Paston Letters reflects the general condition of England during the period. It was a time of trouble. The weakness of the government had disorganized every branch of the administration; the succession to the crown itself was contested; the great nobles lived in a state of civil war; and the prevailing discontent found expression in the rising of Jack Cade and in the Wars of the Roses. The correspondence reveals the Pastons in a great variety of relations to their neighbours, friendly or hostile; and abounds with illustrations of the manners and morals of the time. Nothing is more remarkable than the habitual acquaintance of educated persons, both men and women, with the law, which was evidently indispensable to persons of substance. In addition to the editions of the Paston Letters already mentioned, see F. Blomfield and C. Parkin, History of Norfolk (London, 1805-1810), and the article in Dic. Nat. Biog. (A. W. H.*.)

PASTORAL (from Lat. pastor, a shepherd), the name given to a certain class of modern literature in which the "idyll" or the "eclogue" of the Latins are imitated. It was a growth of humanism at the Renaissance, and its first home was Italy. Virgil had been imitated, even in the middle ages, but it was the example of Theocritus (q.v.) that was originally followed in pastoral. Pastoral, as it appeared in Tuscany in the 16th century, was really a developed eclogue, an idyll which had been expanded from a single scene into a drama. The first dramatic pastoral which is known to exist is the Favola di Orfeo of Politian, which was represented at Mantua in 1472. This poem, which has been elegantly translated by J. A. Symonds, was a tragic love poem, sixty-six pages long, and is perhaps too grave in tone to be considered as a pure pastoral. It led the way more directly to tragedy than to pastoral, and it is the II Saggisfazio of Agostino Beccari, which was played at the court of Ferrara in 1554, that is always quoted as the first complete and actual dramatic pastoral in European literature. In the west of Europe there were various efforts made in the direction of non-dramatic pastoral, which it is hard to classify. Early in the 16th century Alexander Barclay, in England, translated the Latin eclogues of Mantuanus, a scholar writer of the preceding age. Barnabe Googe, a generation later, in 1563, published his Egloges, Epitaphes and Somnettes, a deliberate but not very successful attempt to introduce pastoral into English literature. In France it is difficult to deny the title of pastoral to various productions of the poets of the Pléiade, but especially to Rémy Belleau's pretty miscellany of prose and verse in praise of a country life, called La Bergerie (1535). But the final impulse was given to non-dramatic pastoral by the publication, in 1554, of the famous Arcadia of J. Sannazar, a work which was read in various translations to the end of the 18th century, and which was abundantly copied. Torquato Tasso, followed Beccari after an interval of twenty years, and by the success of his Aminta, which was performed before the court of Ferrara in 1573, secured the popularity of dramatic pastoral. Most of the existing works in this class may be traced back to the influence either of the Arcadia or of the Aminta. Tasso was immediately succeeded by Alvisio Pasqualigo, who gave a comic turn to pastoral drama, and by Cristoforo Castelletti, in whose hands it grew heroic and romantic, while, finally, Guarini produced in 1590 his famous Pastor Fido, and Ongaro his fishermen's pastoral of Alice in 1591. During the last quarter of the 16th century pastoral drama was really a power in Italy. Some of the best poetry of the age was written in this form, to be acted privately on the stages of the little court theatres, that were everywhere springing up. In a short time music was introduced, and rapidly predominated, until the little forms of tragedy, and pastoral altogether, were merged in opera.

With the reign of Elizabeth a certain tendency to pastoral was introduced in England. In Gascoigne and in Whetstone traces have been observed of a tendency towards the form and spirit of eclogue. It has been conjectured that this tendency, combined with the study of the few extant eclogues of Clément Marot, led Speusor to the composition of what is the finest example of pastoral in the English language, the Shepherd's Calendar, printed in 1579. This famous work is divided into twelve eclogues, and it is remarkable because of the constancy with which Spenser turns in it from the artificial Latin style of pastoral then popular in Italy, and takes his inspiration direct from Theocritus. It is important to note that this is the first effort made in European literature to bring upon a pastoral stage the actual rustic of a modern country, using their own peasant idiom, and not that Spenser's attempt was very imperfectly carried out does not militate against the genuineness of the effort, which, the very adoption of such names as Willie and Cuddle, instead of the customary Damon and Daphnis, is enough to prove. Having led up to this work, the influence of which was to be confined to England, we return to Sannazar's Arcadia, which left its mark upon every literature in Europe. This remarkable romance, which was the type and the original of so many succeeding pastorals, is written in rich but not laborious periods of musical prose, into which are inserted at frequent intervals passages of verse, contests between shepherds on the "humile fistula di Coridone," or laments for the death of some beautiful virgin. The characters move in a world of supernatural and brilliant beings; they commune without surprise with "I gloriosi spiriti degli boschi," and reflect with singular completeness their author's longing for an innocent voluptuous existence, with no hell or heaven in the background.

It was in Spain that the influence of the Arcadia made itself most rapidly felt outside Italy. The earliest Spanish eclogues had been those of Juan de Encina, acted in 1492. Gil Vicente, who was also a Portuguese writer, had written Spanish religious pastorals earlier in the 16th century. But Garcilaso de la Vega is the founder of Spanish pastoral. His first eclogue, El Dulce lamentar de los pastores, is considered one of the first poems of its kind in ancient or in modern literature. He wrote little, and died early, in 1536. Two Portuguese poets followed him, and composed pastorals in Spanish, Francisco de Sá de Miranda, who imitated Theocritus, and the famous Jorge de Montemayor, whose Diana (1524) was founded on Sannazar's Arcadia. Gaspar Gil Polo, after the death of Montemayor in 1561, completed his romance, and published in 1564 a Diana enamorada. It will be recollected that both these works are mentioned with respect, in their kind, by Cervantes. The author of Don Quijote himself published an admirable pastoral romance, Galatea, in 1584.

In France there has always been so strong a tendency towards a graceful sort of bucolic literature that it is hard to decide what should and what should not be mentioned here. The charming pastorales of the 13th century, with their knight on horseback and shepherdess by the roadside, need not detain us further than to hint that when the influence of Italian pastoral began to feel itself in France these earlier lyrics gave it a national inclination. We have mentioned the Bergerie of Rémy Belleau, in which the art of Sannazar seems to join hands with the simple sweetness of the medieval pastorelle. But there was nothing in France that could compare with the school of Spanish pastoral writers which we have just noticed. Even the typical French pastoral, the Astrée of Honoré d'Urfé (1610), has almost more connexion with the knightly romances which Cervantes laughed at than with the pastorals which he praised. The famous Astrée was
the result of the study of Tasso's Aminius on the one hand and Montemayor's Diana on the other, with a strong flavouring of the romantic spirit of the Amadis. To remedy the past tendency of the Astèrè a priest, Camus de Pontcarré, wrote a series of Christian pastorals. Racoon produced in 1625 a pastoral drama, Les Bergeries, founded on the Astèrè of D'Urfé.

In England the movement in favour of Theocritan simplicity which had been introduced by Spenser in the Shepherd's Calendar, was immediately defeated by the success of Sir Philip Sidney's Arcadia, a romance closely modelled on the masterpiece of Sannazarro. So far from attempting to sink to colloquial idiom, and adopt a realism in rustic dialect, the tenor of Sidney's narrative is even more grave and stately than it is conceivable that the conversation of the most serious nobles can have ever been. Henceforward, in England, pastoral took one or other of these forms. It very shortly appeared, however, that the Sannazarian form was more suited to the temper of the age, even in England, than the Theocritan. In 1583 a great impetus was given to the former by Robert Greene, who was composing his Morando, and still more in 1584 by the publication of two pastoral dramas, the Galathea of Lyly and the Arrangement of Paris of Peele. It is doubtful whether either of these writers knew anything about the Arcadia of Sidney which was posthumously published, but Greene, at all events, became more and more imbued with the Italian spirit of pastoral. His Menaphon and his Never too Late are pure bucolic romances. While in the general form of his stories, however, he follows Sidney, the verse which he introduces is often, especially in the Menaphon, extremely rustic and colloquial. In 1589 Lodge appended some elegies to his Scilla's Metamorphosis, but in his Rosalynde (1590) he made a much more important contribution to English literature in general, and to Arcadian poetry in particular. This beautiful and fantastic book is modelled more exactly upon the masterpiece of Sannazarro than any other in our language. The three Idylls of 1588, paraphrases of Theocritus, are anonymous, but conjecture has attributed them to Sir Edward Dyer. In 1598 Bartholomew Young published an English version of the Diana of Montemayor.

In 1585 Watson published his collection of Latin elegiacal elegies, entitled Amyntas, which was translated into English by Abraham Franchise in 1587. Watson is also the author of two frigid pastorals, Malioheus (1590) and Amyntae gaudia (1592). John Dickinson printed at a date unstated, but probably not later than 1592, a "passionate eclogue" called The Shepherd's Complaint, which begins with a harsh burst of hexameters, but which soon settles down into a harmonious prose story, with lyrical interludes. In 1594 the same writer published the romance of Arisbas. Drayton is the next pastoral poet in date of publication. His Idea: Shepherd's Garland bears the date 1593, but was probably written much earlier. In 1595 the same poet produced an Eudimion and Phoebe, which was the least happy of his works. He then turned his fluent pen to the other branches of poetic literature; but after more than thirty years, at the very close of his life, he returned to this early love, and published in 1627 two pastorals, The Quest of Cynthia and The Shepherd's Sirena. The general character of all these pieces is rich, but vague and unimpassioned. The Queen's Arcadia of Daniel must be allowed to lie open to the same charge, and to have been written rather in accordance with a fashion than in following of the author's predominant impulse. The singular eclogue by Barnfield, The Afectionate Shepherd, printed in 1594, is an exercise on the theme: "O crudelis Alexi, nihil mea carina curas," and, in spite of its juvenility and indiscruction, takes rank as the first really poetical following of Spenser and Virgil, in distinction to Sidney and Sannazarro. Marlowe's pastoral lyric Come live with me, although not printed until 1599, has been attributed to 1580. In 1600 was printed the anonymous pastoral composite in rhyme, The Maid's Metamorphosis, long attributed to Lyly.

With the close of the 16th century pastoral literature was not extinguished in England as suddenly or as completely as it was in Italy and Spain. Throughout the romantic Jacobean age the English love of country life asserted itself under the guise of pastoral sentiment, and the influence of Tasso and Guarini was felt in England just when it reached its height in Italy. In England it became the fashion to publish lyrical eclogues, usually in short measure, a class of poetry peculiar to the nation and to that age. The lighter staves of The Shepherd's Calendar were the model after which all these graceful productions were drawn. We must confine ourselves to a brief enumeration of the principal among these Jacobean eclogues. Nicholas Breton came first with his Passionate Shepherd in 1604. Withier followed with The Shepherd's Hunting in 1615, and Braithwaite, an inferior writer, published The Poet's Willow in 1615 and Shepherd's Tales in 1621. The name of Withier must recall to our minds that of his friend William Browne, who published in 1613-1616 his beautiful collection of Devonshire idylls called Britanniad's Pastorals. These were in heroic verse, and less distinctly Spenserian in character than those eclogues recently mentioned. In 1614 Browne, Wither, Christopher Brook and Davies of Hereford united in the composition of a little volume of pastorals entitled The Shepherd's Pipe. Meanwhile the composition of pastoral dramas was not entirely disregarded. In 1660 Day dramatized part of Sidney's Arcadia in his Isle of Gulls, and about 1625 the Rev. Thomas Goffe composed his Careless Shepherdess, which Ben Jonson deigned to imitate in the opening lines of his Sad Shepherd. In 1610 Fletcher produced his Faithful Shepherdess in emulation of the Aminta of Tasso. This is the principal pastoral play in the language, and, in spite of its faults in moral taste, it preserves a fascination which has evaporated from most of its fellows. The Arcades of Milton is scarcely dramatic; but it is a bucolic ode of great stateliness and beauty. In the Sad Shepherd, which was perhaps written about 1635, and in his pastoral masques, we see Ben Jonson not disdaining to follow along the track that Fletcher had pointed out in the Faithful Shepherdess. With the Piscatory Eclogues of Phineas Fletcher, in 1633, we may take leave of the more studious and sentimental element of pastoral in England early in the 17th century. When pastoral had declined in all the other nations of Europe, it enjoyed a curious recrudescence in Holland. More than a century after date, the Arcadia of Sannazarro began to exercise an influence on Dutch literature. Johan van Heemskirk led the way with his popular Batavische Arcadia in 1637. In this curious romance the shepherds and shepherdesses move to and fro between Katwijk and the Hague, in a landscape unaffectedly Dutch. Heemskirk had a troop of imitators. Hendrik Zoeteboom published his Zaamtlandsche Arcadia in 1638, and Lambertus Bos his Dorstische Arcadia in 1662. These local imitations of the suave Italian pastoral were followed by still more crude romances, the Rotterdamsche Arcadia of Willem den Elger, the Waltherische Arcadia of Gargon, and the Noordwijker Arcadia of Jacobus van der Valk. Germany has nothing to offer us of this class, for the Diana of Werder (1644) and Die adriaatische Roeme van Zesen (1645) are scarcely pastorals even in form.

In England the writing of eclogues of the sub-Spanserian class of Breton and Wither led in another generation to a rich growth of lyrics which may be roughly called pastoral, but are not strictly bucolic. Carew, Lovelace, Suckling, Stanley and Cartwright are lyricists who all contributed to this harvest of country song, but by far the most copious and the most characteristic of the pastoral lyricists is Herrick. He has, perhaps, no rival in modern literature in this particular direction. His command of his resources, his deep originality and observation, his power of concentrating his genius on the details of rural beauty, his interest in recording homely facts of country life, combined with his extraordinary gift of song to place him in the very first rank among pastoral writers; and it is noticeable that in Herrick's hands, for the first time, the pastoral became a real and modern, instead of being an ideal and humanistic thing. From him we date the recognition in poetry of the humble beauty that lies about our doors. His genius and influence were almost instantly obscured by the Restoration. During the final decline of the Jacobean drama a certain number of pastorals were still produced. Of these the only ones which deserve
PASTORAL EPISTLES—PASTORAL STAFF

mention are three dramatic adaptations, Shirley's Arcadia (1649), Fantham's Pastor Fido (1646), and Leonard Willan's Anchore (1651). The last pastoral drama in the 17th century was Settle's Pastor Fido (1677). The Restoration was extremely unfavourable to this species of literature. Sir Charles Sedley, Apha Behn and Congreve published eclogues, and the Pastoral Dialogue between Thrisis and Strephon of the first-mentioned was much admired. All of these, however, are in the highest degree insipid and unreal, and partook of the extreme artificiality of the age.

Pastoral came into fashion again early in the 18th century. The controversy in the Guardian, the famous critique on Ambroise Philip's Pastoral's, the anger and rivalry of Pope, and the doubt which must always exist as to Steele's share in the mystification, give 1708 a considerable importance in the annals of bucolic writing. Pope had written his idylls first, and it was a source of infinite annoyance to him that Phillips contrived to precede him in publication. He succeeded in throwing ridicule on Phillips, however, and his own pastoral was greatly admired. Yet there was some nature in Phillips, and, though Pope is more elegantly and faultlessly better, the work is more genuinely bucolic than his rival. A far better writer of pastoral than either is Gay, whose Shepherd's Week was a serious attempt to throw to the winds the ridiculous Arcadian tradition of nymphs and swains, and to copy Theocritus in his simplicity. Gay was far more successful in executing this pleasing and natural cycle of poems than in writing his pastoral tragedy of Dione or his "tragi-comico pastoral farce" of The What's ye call it! (1715).

He deserves a very high place in the history of English pastoral on the score of his Shepherd's Week. Swift proposed to Gay that he should write a Newgate pastoral in which the swains and nymphs should talk and warble in slang. This Gay never did attempt, but a northern admirer of his and Pope's achieved a veritable and lasting success in Lowland Scotch, a dialect then considered no less beneath the dignity of verse. Allan Ramsay's Gentle Shepherd, published in 1725, was the last, and remains the most venerated and interesting, bucolic drama produced in Great Britain. It received a favour, a hundred and fifty years after, among Lowland reapers and milkmaids.

With the Gentle Shepherd the chronicle of pastoral in England practically closes. This is at least the last performance which can be described as a developed eclogue of the school of Tasso and Guarini. It is in Switzerland that we find the next important revival of pastoral properly so-called. The taste of the 18th century was very agreeably tickled by the religious idylls of Salomon Gessner, who died in 1735. His Daphnis und Philippis and Der Tod Abels were read and imitated throughout Europe. In German literature they left but little mark, but in France they were cleverly copied by Arnaud Berquin. A much more important pastoral writer is Jean Pierre Clovis de Floriant, who began by imitating the Galatea of Cervantes, and continued with an original bucolic romance entitled Estelle. It has always been noticeable that pastoral is a form of literature which disappears better than the great dramas. Not-Floriant nor his follower Abbit were able to survive the laughter of Herder. Since Floriant and Gessner there has been no reappearance of bucolic literature properly so-called. The whole spirit of romanticism was fatal to pastoral. Voss in his Luise and Goethe in Hermann und Dorothea replaced it by poetic scenes from homely and simple life.

Half a century later something like pastoral reappeared in a totally new form, in the fashion for Dorfgeschichten. About 1830 the Danish poet S. S. Blicher, whose work connects the slim studies of George Crabbe with the milder modern strain of pastoral, began to publish his studies of out-door romance among the poor in Jutland. Immermann followed in Germany with his novel Der Oberhof in 1839. Auerbach, who has given to the 19th-century idyll its peculiar character, began to publish his Schwabenlinder Dorfgeschichten in 1843. Meanwhile George Sand was writing Jeanne in 1844, which was followed by La Mare au Diable and François le Champi, and in England Clough produced in 1845 his remarkable long-vacation pastoral The "Pastorale of Tover-na-Vuolotl. It seems almost certain that these writers followed a simultaneous but independent impulse in this curious return to bucolic life, in which, however, in each case, the old tiresome conventionality and affectation of lady-like airs and graces were entirely dropped. This school of writers was presently enriched in Norway by Björnson, whose Synnøve Solbakken was the first of an exquisite series of pastoral romances. But perhaps the best of all modern pastoral romances is Fritz Reuter's Ut mine Stromid, written in the Mecklenburg dialect of German. In England the Dorsetshire poems of William Barnes and the Dorsetshire novels of Thomas Hardy belong to the same class. It will be noticed, of course, that all these recent productions have so much in common with the literature which is produced around them that they almost evade separate classification. It is conceivable that some poet, in following the antiquarian tendency of the age, may enshrine his fancy once more in the five acts of a pure pastoral drama of the school of Tasso and Fletcher, but any great vitality in pastoral is hardly to be looked for in the future.

PASTORAL EPISTLES, the name given to St Paul's letters to Timothy and Titus. The term seems to have originated with J. A. W. Wegscheider (1771-1849), professor at Halle. The three epistles mentioned are written to men rather than churches, and to men appointed to certain pastoral work. In this respect they differ from the personal and intimate note which Paul wrote to Philemon. They are closely related in origin, style, diction and thought, and occupy so distinct a place in these respects that the Pauline authorship of them has been much questioned. (See Timothy, Epistles to; Titus, Epistle to.)

PASTORAL LETTER, an open letter addressed by a bishop to the clergy or laity of his diocese, or to both, containing either general admonition, instruction or consolation, or directions for behaviour in particular circumstances. In the Catholic Church such letters are also sent out regularly at particular ecclesiastical seasons, particularly at the beginning of fasts. In the non-episcopal Protestant churches the name "pastoral letter" is given to any open letter addressed by a pastor to his congregation, but more especially to that customarily issued at certain seasons, e.g. by the moderator of a Presbyterian assembly or the chairman of a Congregational or Baptist union.

PASTORAL STAFF, in the Christian Church, an ensign of office or dignity. It is some five feet long, ending at the top in a crook (volute) bent inwards, and made of metal, ivory or wood. If of metal, it is hollow; if of wood, it is usually covered with metal. The crook is usually richly ornamented, and is divided from the shaft by a boss; the shaft is commonly separated into sections by rings, so that it can be taken to pieces.

The pastoral staff is the ensign proper of cardinals (except cardinal-deacons) and bishops; but the former are entitled to use it only in the churches from which they derive their titles, the latter only in their dioceses. The pope so early as the time of Innocent III. did not carry the pastoral staff, and it would be very hard to have been his custom. The ferrula that the Ordo of Cencius Sabellius (ch. 48) speaks of was not a pastoral staff, but the symbol of authority over the papal palace, with which by its transference he was invested. This ferrula, mentioned by Luitprand of Cremona in his account of the deposition of Benedict V., and the baculus aureus of the Historia dedicationis ecclesiae cotensis (Acta Sanctorum, 4 March, i. 354) are scepters. Abbots carry the pastoral staff only when specially empowered by the pope to do so, and then only in the territory under the jurisdiction of their monastery and in the churches subordinate to it. With certain restrictions the pastoral staff is also sometimes conceded to dignitaries of cathedral and collegiate churches, but never to abbesses (Sacra Congreg. Ril. 30 Jan. 1635).

The pastoral staff, as its name implies, symbolizes the pastoral office and authority, a symbolism already known to Isidore of Seville (De ecclesiast. off. ii. 5). This symbolism is expressed in the words used, at least since the 10th century, by the consecrator in delivering the pastoral staff at the consecration of a
bishops and the benediction of an abbot. The pastoral staff is carried in the left hand, in order that the right may remain free to give the blessing. The bishop is directed so to hold it (Ceremon. Episc. ii. 8, 25) that the crook is turned towards the people. It is used not only at pontifical High Mass but at all solemn pontifical functions, e.g. vespers, consecrations, processions. It is uncertain at what period the use of the pastoral staff was introduced; but the evidence tends to show that it was about the 5th century, in Gaul or Spain. The pastoral staff was certainly in use in Gaul in the 6th century (Vita S. Caesar, Arelat. ii. 18), in Spain at least as early as the 7th, and in Ireland also in the 7th; in Italy, so far as the available evidence shows, its introduction was comparatively late. It had originally nothing of its present liturgical character; this was given to it in the post-Carolingian period.

As regards the development of the form of the pastoral staff, there are four principal types: (1) Staves with a simple crook,

the oldest form, which survived in Ireland until the 12th century; (2) Staves with a ball or knob at the top, a rare form which did not long survive as a pastoral staff; (3) Staves with a horizontal crook, so-called Tau-staves, used especially by abbots and surviving until the 13th century; (4) Staves with crook bent inwards. These last already appear in miniatures of the 9th century; from the 11th onwards they predominated; and in the 13th century they ousted all other forms. Originally plain, the crook was from the 11th century onwards often made in the form of a snake (5), which in richer staves encircled the Lamb of God or the representation of a figure. Since the 13th century the snake, under Gothic influence, developed into a boldly designed tendril set with leaves which, in some cases, forms a group of figures, and the knob dividing shaft and crook into an elegant chapel (6 and 7). Finally, at the close of the middle ages, the lower part of the crook was bent outwards so that the actual volute came over the middle of the knob, the type that remained dominant from that time onwards (8). As a decoration, rather than for practical reasons, a fine folded cloth (pamnisselas, sudorium, velum, Eng. veil), was from the 14th century onwards often suspended from the knob of the pastoral staff. This was done both in the case of bishops' and of abbots' staves, but is now confined to the latter (Ceremon. episc. i. 11, 5; Decr. Alex. VII. 27 Sept. 1650; Sacr. Congr. Rit. 27 Sept. 1847).

From the pastoral staff must be distinguished the staff of the chœopeleseos (director of the choir) and cantors, which is still in use here and there. This, which is also known as bordonis, was developed out of the choir-staves, originally no more than sticks to lean on during the long services.

The Reformation abolished the pastoral staff almost everywhere. In the Church of England, however, it was retained among the episcopal ornaments prescribed by the first Prayer-book of Edward VI., and, though omitted in the second Prayer-book, its use seemed once more to be enjoined under the Ornaments Rubric of Elizabeth's Prayer-book. Whatever the theoretical value of this injunction may have been, however, in practice the use of the pastoral staff was discontinued until its gradual revival in the last decades of the 19th century.

In the Churches of the East, a pastoral staff (Gr. ἱσάκας, Russ. possosh, patsissa, Syr. πατσία, Arm. jvarapetats, Copt. ṣḥt) is borne among the Syrians only by the patriarch, in all the other rites by all bishops, in the Greek Church also by archimandrites and abbots, and in the Armenian Church also by the varthapelos (teachers). The staff of an Armenian patriarch is reminiscent of that of the Western patriarch, which is apparently derived; that of the varthapelos is encircled at the upper end by one or two snakes. The Coptic patriarch uses an iron cross-staff. For the rest, the pastoral staff in the Oriental rites is T-shaped. It is of wood inlaid with ivory and mother-of-pearl. A veil is attached to the staff among the Greeks, Armenians and Copts. The bishops of the Coptic, Syrian and Nestorian Uniate Churches have adopted the Roman pastoral staff.

See Ch. Cahier et A. Martin, Mélanges d'archéologie (Paris, 1856), iv. 145 seq.; Rohault et Fleury, La Messe (Paris, 1886), vii. 75 seq. For the use of pastoral staffs in certain uniat churches, see the committee of Convocation on the Ornaments of the Church, &c. (London, 1898).}

**PATAGONIA**

The name given to that portion of South America which, to the east of the Andes, lies mainly south of the Rio Negro (41° S.), and, to the west of the Andes, south of the Chilean province of Llanquihue (44° S.). The Chilean portion embraces the two provinces of Chillö and Magallanes. East of the Andes the Argentine portion of Patagonia is divided into four territories: (1) Neuquen, 42,000 sq. m. approximately, including the triangle between the rivers Limay and Neuquen, and extending southward to the northern shore of Lake Nahuel-Huapi (41° S.) and northward to the Rio Colorado; (2) Rio Negro, 76,000 sq. m. approximately, extending from the Atlantic to the Cordillera of the Andes, to the north of 42° S.; (3) Chubut, 65,000 sq. m. approximately, embracing the region between 42° and 46° S.; and (4) that portion of the province of Santa Cruz which stretches from the last-named parallel as far south as the dividing line with Chile, and between Point Dungeness and the watershed of the Cordillera, an area approximately 106,000 sq. m.

Physiography.—The general character of the Argentine portion of Patagonia is for the most part a region of vast steppe-like plains, cut in a succession of abrupt terraces about 300 ft. at the base, and covered with an enormous bed of shingle almost bare of vegetation. In the hollows of the plains are ponds or lakes of brackish and fresh water. Towards the Andes the shingle gives place to papyrus, granite and basalt lavas, animal life becomes more abundant and vegetation more luxuriant, acquiring the characteristics of the flora of the western coast, and consisting principally of the beech and conifers.

Among the depressions by which the plateau is intersected transversely, the principal are the Gualichu, south of the Rio Negro, the Maquinche and Balchét (through which previous faulted the waters of lake Nahuel-Huapi, which now feed the river Limay); the Senguerr, the Desaedo. Besides these transverse depressions there are others in which marking lines of ancient inter-oceanic communication, there are others which are merely or more or less secondary, such as the Yagatoo, Musters and Colhuapi, and others situated to the south of Puerto Desaedo, in the centre of the country. In the central region volcanic eruptions, which have taken part in the formation of the plateau from the Tertiary period down to the present era, cover a large part with basaltic lava-caps; and in the western third more recent glacial deposits appear above the lava. There, in contact with folded Cretaceous rocks, uplifted by the Tertiary granite and basalt lavas, animal life becomes more abundant and vegetation more luxuriant, acquiring the characteristics of the flora of the western coast, and consisting principally of the beech and conifers.

There, in contact with folded Cretaceous rocks, uplifted by the Tertiary granite and basalt lavas, animal life becomes more abundant and vegetation more luxuriant, acquiring the characteristics of the flora of the western coast, and consisting principally of the beech and conifers.

The geological constitution is in accordance with the orographic particulars given above. The plateau, flat to the east, gradually rising on the west, shows Upper Cretaceous rocks at its base. First come Lower Cretaceous hills, raised by granite and dioritic rocks, doubtlessly of Tertiary origin, as in some cases these rocks have been raised by more or less irregular, but in others by more or less regular, folds. The sediments of the Tertiary beds, so rich in mammal remains, then pass off, the west, into the interior; on the rest, there is considerable amount of opinion concerning the succession and correlation of the beds. They are divided by Wilckens into four saries (in ascending order):

PATAGONIA

3. Santa Cruz series. Containing remains of mammals. Middle Miocene.

4. Paraná series. Sandstones and conglomerates with revealed fossil evidence of marine life. This is confined to the eastern part of the region.

The Upper Cretaceous and Tertiary deposits have revealed a most interesting vertebrate fauna. This, together with the discovery of the perfect cranial of a chelonian of the genus Mylonidia, which may be said to be almost identical with Mylonidia ovensi of the Pleistocene age in Queensland, forms an evident proof of the connexion, hitherto unknown, of these two great southern continents. The Patagonian Mylonidia belongs to the Upper Chalk, having been found associated with remains of Dinosauria. Other specimens of the interesting fauna of Patagonia, belonging to the Middle Jurassic, have been discovered by Mr. J. Darlington, of Buenos Aires.

Several species of the freshwater sloths (Clyptodon) are known only from the lower pampa mud, and of the Arctotherium, which is perhaps the most interesting animal in a fauna which is even the most modern Pleistocene deposits in the pampas of Buenos Aires. It would not be surprising if this latter animal were still in existence, for footprints, which may be attributed to it, have been observed in the modern deposits of the river Paraguay, and there remains along its course a considerable number of these cetacean bones. In the Cretaceous and Cenozoic formations of Patagonia, the miocene fossiliferous beds of the Parana have yielded a great number of mammals, and the famous apple orchards supposed to have been planted by the Jesuits in the 17th and 18th centuries. These regions are drained by the river Collon-Cura, the principal affluent of the river Limay. Lake Lacar is now a constituent of the Parana, its outlet having been changed to the west, owing to a passage having been opened through the Cordillera.

The Rio Negro runs along a wide transverse depression. The middle part of the river begins to form the boundary of the province of Neuquen at the confluence of the rivers Limay and Neuquen. In this depression are several settlements, among them Viedma, the capital of the Rio Negro territory, Fringoles, Conesa, Choelo, Choel and Roca. To the south of the Rio Negro the Patagonian plateau is traversed by the rivers Minas and Maquinchau, which in former times directed the waters of two great rivers (now disappeared) to the gulf of San Matias, the first-named depression draining the network of the Collon-Cura and the second the Patagonian. This depression has been found to be a wide transverse depression, apparently the bed of a greater river, now perished, which carried to the Atlantic the waters of a portion of the eastern slope of the Andes, between 41° and 42° 30' S. These late epochs of the Cretaceous and Tertiary are particularly well marked as the Rio Negro territory. Rawson, the capital, is situated at the mouth of the river Chubut on the Atlantic (42° 30' S). The town was founded in 1865 by a group of colonists from Wales, assisted by the Argentine Government. The lower-lying districts, especially those of the Rada Tilly, represent the ancient channel of what has been called the Río Emperador, and are marked by a series of other important centres in the valley, such as Treile and Ganaim, which is connected by railway with Porto Madryn on Bahia Naval. Here is the seat of the governor of the territory, and by 1855 the inhabitants were 16,000, as compared with 12,000 Argentineans, Welsh and Italians, numbered 2,585. The valley has been irrigated and cultivated, and produces the best wheat of the Argentine Republic. Between the Chubut and the Senguier there are various stretches of fertile land, spreading over the whole of the territory to the foot of the Cordillera, and then curling around the Pre-Cordillera, and filling the basins of some desiccated lakes, which have been occupied since 1885, and farms and colonies founded upon them. The chief of these colonies is that of the 16th of October (16 de Octubre), which was founded in 1886, near the river Limay, and has been placed on the foot of the Cordillera, while the remainder are carried away by the affluents of Río Juego, viz., the Cherque, Omek and Apelleg. This region contains auriferous drifts, but these, like the auriferous beds of the roads through Patagonia, are not yet sufficiently investigated. At Lake Fontana there are auriferous drifts and lignite deposits which abound in fossil plants of the Cretaceous age. The streams which flow from the lakes of Río Mayo and Chahia join the tributaries of the Rio Aisen, which flows into the Pacific, passing through its extensive and valuable districts where colonization has been initiated by Argentine settlers. Colonies have also been formed in the Basin of Lakes Musters and Colhue; and on the coast near the Atlantic, near the town of Río Colorado, Camarones and the Gulf of San Jorge, there are extensive

The territory of Santa Cruz is arid along the Atlantic coast and in the central portion between 40° and 50° S. With the exception of certain valleys at Puerto Desolado (Fort Desire) and in the treacherous basins which occur as far south as Puerto San Julian, which contain several cattle farms, few spots are capable of cultivation, the pastures being poor, water insufficient and salt lagunas fairly common. At Puerto Desolado, the people are engaged in the seal trade, and the Andean region situated between Lakes Buenos Aires and Puyredon in close communication with the Atlantic valley of Gallegos, one of these remains have been discovered in the Andean regions.

On the upper plains of Neuquen territory thousands of cattle can be fed, and the forests around Lakes Trafal and Nahuel-Huapi yield pampas grass of quantities of valuable timber. The river Trafal is navigable, but as its waters are capable of being easily dammed in places, large stretches of land in its valley are utilized; but the lands on both sides of its lower part are of little commercial value. As its waters are navigable, it could be used to reach the mouth of the river Negro, and as its delta is formed by the confluence of the rivers Negro and Limay, it is possible that the delta may be suitable for the rearing of cattle and other agricultural purposes exist between the regions which surround the Tromen and the first ridges of the Andes. Chos Malal, the capital of the territory, is situated in one of these valleys. More to the west the valley of the river Neuquen is separated by deposits of silver, gold, copper and lignite. In the centre of the territory, also in the neighbourhood of the mining districts, are the valleys of Norquin and Las Lagas, the general camp of the Argentine armies in the war of 1893, which surround the range of the Andes and have a very fine slope. The wide valleys occur near Río Malleco, Lake Huchuelquen, the river Chimehuin, and Vega de Chapelo, near Lake Lacar, where are situated villages of some importance, such as Junín de los Andes and San Martín de los Andes. Close to these are the famous apple orchards supposed to have been planted by the Jesuits in the 17th and 18th centuries. These regions are drained by the river Collon-Cura, the principal affluent of the river Limay. Lake Lacar is now a constituent of the Parana, its outlet having been changed to the west, owing to a passage having been opened through the Cordillera.

In so far as its main characteristics are concerned, Patagonia seems to be a prolongation of the Antartic. It is the most ancient formation of the world; and the permanence of which dates from very recent times, as is evidenced by the apparent recent emergence of the islets around Chiloé, and by the general character of the pampa formation. Some of the granite formations of the Antartic Patagonia seem to have pierced the glaciers at their head; and it is evident that a part of the islets around Chiloé has been recently emerged. In the Atlantic coasts of the same province, and in quantity and size towards the south, seem to indicate that the caps of shingle which now cover such a great part of the Patagonian territory recently extended farther to the east, over land which has now disappeared beneath the water, and that the salt-water deposits left by it when it retired, forming some of the lowlands which occur on the littoral and in the interior of the caps, are much more recent phenomena; and certain forms of shingle, derived from rocks of a different class from those of the surrounding region, indicate that this great area of the Atlantic coasts of the same province, and in quantity and size towards the south, seem to indicate that the caps of shingle which now cover such a great part of the Patagonian territory recently extended farther to the east, over land which has now disappeared beneath the water, and that the salt-water deposits left by it when it retired, forming some of the lowlands which occur on the littoral and in the interior of the caps, are much more recent phenomena; and certain forms of shingle, derived from rocks of a different class from those of the surrounding region, indicate that this great area of the Atlantic coasts of the same province, and in quantity and size towards the south, seem to indicate that the caps of shingle which now cover such a great part of the Patagonian territory recently extended farther to the east, over land which has now disappeared beneath the water, and that the salt-water deposits left by it when it retired, forming some of the lowlands which occur on the littoral and in the interior of the caps, are much more recent phenomena; and certain forms of shingle, derived from rocks of a different class from those of the surrounding region, indicate that this great area of the Atlantic coasts of the same province, and in quantity and size towards the south, seem to indicate that the caps of shingle which now cover such a great part of the Patagonian territory recently extended farther to the east, over land which has now disappeared beneath the water, and that the salt-water deposits left by it when it retired, forming some of the lowlands which occur on the littoral and in the interior of the caps, are much more recent phenomena; and certain forms of shingle, derived from rocks of a different class from those of the surrounding region, indicate that this great area of the
PATAGONIA

Into this inlet there flowed at the time of the conquest a voluminous river, which subsequently disappeared, but returned again to its ancient bed, owing to the river Fenix, one of its affluents, which had deviated to the west, regaining its original direction. Lake Buenos Aires, measuring 75 m. in length and 40 m. in breadth, poured its waters into the Atlantic even in post-glacial times by means of the river Deseado; and it is so depicted on the maps of the 17th and 18th centuries; and so too did Lake Puyereyron, which, thus deviated to the west, fell into the river Las Heras, into the Calen inlet of the Pacific, in 48° S. Julian on Puerto San Julian, where Ferdinand Magellan winterted, is the centre of a cattle farming colony, and colonists have pushed into the interior up the valley of a now extinct river which paratively recent times carried down to Puerto San Julian the waters of Lakes Volcan, Belgrano, Azara, Nansen, and some other lakes which now drain into the river Mayer and so into Lake San Martin. The Rio Chubut, too, which in the latter half of its course, as well as those of Lake Shuehun, afford excellent grazing, and around Lakes Belgrano, Burmeister and Rio Mayer and San Martin there are spots suitable for cultivation. In the Cretaceous hills which flank the Cordillera important stream beds and deposits of mineral oils have been discovered. The Rio Santa Cruz, originally explored by Captain Fitzroy and Charles Darwin, is an important artery of communication between the regions bordering upon the Cordillera and the Atlantic. In Santa Cruz buy an important trade centre has been established. But the present cattle region par excellence of Patagonia is the department of Rio Gallegos, the farms extending from the Atlantic to the Cordillera. Puerto Gallegos itself is an important port of call which is rivalled by the colony of Punta Arenas, on the Straits of Magellan. Owing to the produce of the cattle farms established there, the working of coal in the neighbourhood, and the export of timber from the surrounding forests, Puerta Arenas is an important seaport. Its population numbers about 4000. But the colonization of the western (Chilean) coast has generally failed, principally owing to the adverse climatic conditions of the Cordillera in those latitudes.

Less severe to the south are the early and brisk Travellers. The east slope is warmer than the west, especially in summer, as a branch of the southern equatorial current reaches its shores, whereas the west coast is washed by a cold current. At Puerto Montt the mean annual temperature is 52° F. and the average extremes 78° and 29°, whereas at Bahia Blanca near the Atlantic coast and just outside the northern confines of Patagonia the annual temperature is 59° and the range maximum and minimum 76° and 33°. Bahia Blanca has 43° and the average extremes 76° and 28°. The prevailing winds are westerly, and the westward slope has a much heavier precipitation than the eastern; thus at Puerto Montt the mean annual precipitation is 97 in., but at Bahia Blanca it is 19 in. At Punta Arenas it is 22 in.

Patagonia: the guanaco, the puma, the zorro or Brazilian fox (Canis auzare), the zorro or Arophithia patagonica, (a kin of skunk), and the foxes (Lycalopex rothschildi), are typical mammalian characters of the Patagonian plains. The guanaco roam in herds over the country and form with the ostrich (Rhea americana, more rarely Rhea darwini) the chief means of subsistence of the native inhabitants. The guanaco, found wild on islands, is a bolas. Bird-life is often wonderfully abundant. The carrancha or carrion-hawk, Polyborus thorus, is one of the characteristic objects of a Patagonian landscape; the presence of long-tailed green parakeets (Guaruba cyanocephali) as far south as the shores of the Strait attracted the attention of the earlier navigators; and humming-birds may be seen flying amidst the falling snow. Of the many kinds of water-fowl it is enough to mention the flamingo, the upland goose, and in the strait the remarkable steamer duck.

Population.—The natives of Patagonia are nearly extinct. Here and there may be seen one or two Tehuelches or Gennakens encampment, but natives of pure race are now very scarce, and the two races all told probably do not number more than 100 male individuals. The Tehuelches were the dominant race in Patagonia. These people, from whom the name of Tierra de Patagonia was given by Magellan on observing their large footprints, are remarkable for their great stature, having an average height of 6 ft. to 6 ft. 4 in. They are not known to have applied any collective name to their various tribes; Tehuelche is the Araucanian name for them. They have been described as kindly in disposition; sometimes addicted to gambling and drinking, although they may be long enduring of privation. Their religion recognized a Great Spirit, and designated the new moon as an object of worship. The Gennakens differ in type and language from the Tehuelches. The remaining population is composed of Araucanians, a mixture of the Tehuelches and Gennaken. They are not the only type of people who have dwelt in Patagonia. The ancient burial-places have yielded the bones of other races quite distinct from the present inhabitants, some of them having greatly resembled the primitive types which are met with more to the north, in the Argentine Chaco and in Brazil. Others, again, strongly resembled certain of the Pacific races, in that they possessed ethnic characteristics which have not been observed elsewhere in South America. Among these remains every type of artificial deformity of the skull hitherto known has been found, while at the present time the natives only practise the occipital deformation which is so common among the western tribes of America.

History.—Patagonia was discovered in 1520 by Ferdinand Magellan, who on his passage along the coast named many of the more striking features—Gulf of San Matias, Cape of 11,000 Virgins (now simply Cape Virgenes), &c. By 1611 the Patagonian god setebol (tattalah in Pigafetta) was familiar to the hearers of the Tempest. Rodrigo de Isla, despatched in 1553 from San Matias by Alcazava Sotomayor on whom western Patagonia had been conferred by the king of Spain, was the first to traverse the great Patagonian plain, and, but for the mutiny of his men, he would have struck across the Andes to the Chilean side. Pedro de Mendoza, on whom the country was next bestowed, lived to found Buenos Aires, but not to carry his explorations to the south. Alfonso de Camargo (1539), Juan Ladrilleros (1557) and Hurtado de Mendoza (1558) helped to make known the western coasts, and Sir Francis Drake’s voyage in 1577 down the eastern coast through the strait and northward by Chile and Peru was memorable for several reasons; but the geography of Patagonia owes more to Pedro Sarmiento de Gamboa (1579-1580), who, devoting himself especially to the south-west region, made careful and accurate surveys. The settlement which he founded at Nombre de Dios and San Felipe were neglected by the Spanish government, and the latter was in such a miserable state when Thomas Cavendish visited it in 1587 that he called it Port Famine. The district in the neighbourhood of Puerto Deseado, explored by John Davis about the same period, was taken possession of by Sir John Narborough in the name of King Charles II. in 1669. In the second half of the 18th century knowledge of Patagonia was augmented by Byron (1764-1765), S. Wallis (1766) and L. A. de Bourgainville (1766); Thomas Falkner, a Jesuit who “resided near forty years in those parts,” published his Description of Patagonia (Hereford, 1774); Francesco Vedima founded El Carmen, and Antonio advanced inland to the Andes (1783); and Basilio Villarino ascended the Rio Negro (1785). The “Adventures and Expeditions” (1807-1814) of Captain J. A. Ladrilleros, and the “Expeditions” (1826-1830) of Francisco Palacios, and Robert Fitzroy (1832-1836) were of first-rate importance, the latter especially from the participation of Charles Darwin; but of the interior of the country nothing was observed except 200 miles of the course of the Santa Cruz. Captain G. C. Musters in 1869 wandered in company with a band of Tehuelches through the whole length of the country from the strait to the Manzanos in the north-west, and collected a great deal of information about the people and their mode of life. Since that date explorations have been carried on by F. P. Moreno, RamonLista, Carlos M. Moyano, A. Bertrand, H. Steffen, P. Krüger, R. Hauthal, C. Burckhardt, O. Nordenskiöld, J. B. Hatcher, the surveyors of the Argentine and Chilean Boundary Commissions and others.

Bibliographical lists for Patagonia are given in J. Wappaus, Handbuch der Geogr. u. Stat. des ehem. span. Mittel- und Süd-Amerika (Leipzig, 1865-1870); in V. G. Quiesada, La Patagonia y las tierras australes del continente americano (Buenos Aires, 1843); and in T. Coan, Adventures in Patagonia (New York, 1880). See also C. Darwin, Journal of Researches (London, 1845), and Geological Observations on South America (London, 1846); W. Parker Snow, Two Cruises off. PATAN ("city"), the name of two historic cities in India. One of these, known as Anhilwada Patan, was the capital of the last Hindu dynasty of Gujarat, sacked by Mahmud of Ghazni and finally destroyed by the Mahmoodedans in 1298. Near its ruins, which are not considered, has sprung up a modern town, in the state of Baroda (pop. 31,402), which contains many Jain temples (with palm-leaf MSS.) and has manufactures of fine cotton and silk textiles. The other Patan, known as Lalit Patan, was the capital of one of the three Newar kingdoms in the valley of Nepal, conquered by the Gorkhas at the end of the 18th century. It is situated close to Katmandu, on the opposite bank of the Bagmati. It was founded by Prithvi Narayan Shah (1768-1816). H. Hesketh Prichard, Through the Heart of Patagonia (London, 1902).

PATARA, an ancient town of Asia Minor, on the Lycian coast, 3 m. E. of the mouth of the Xanthus river (mod. Eabbar Chai). It was noted from early times for its temple and oracle of Apollo, and, as the port of Xanthus and other towns of the same valley, had a large trade, and was regarded as the metropolis of Lycia. Enlarged by Ptolemy Philadelphus I. and renamed for a time Arsinoe, it was adorned by Vespasian with baths. St Paul changed there into a "ship of Phoenicia" on his way to Jerusalem in A.D. 60. Patara was the reputed birth-place of St Nicholas. The principal extant monuments are a triple triumphal arch, with inscription, through which ran the road to Xanthus, and the walls, discernible on either hand of it; the theatre, 265 ft. in diameter, built in A.D. 145 (as attested by an inscription) and wonderfully well preserved, though largely filled with drift sand; and the thermae, built by Vespasian north of the harbour.

PATARENES, or PATArelli, a name apparently first used in Milan about 1058 to denote the extreme opponents of clerical marriages. The party was so called because, under the leadership of Arideus, a deacon of Milan, its members used to assemble in the Pataria or ragmen's quarter of that city (pates being a provincial word for a rag). In the 13th century the name was appropriated by the Cathari, who said it came from pati (to suffer), because they endured hardship for their faith. See BOGOMILLS.

PATAS MONKEY, a West African species of the guenon monkeys (see GUENON), characterized by its large size, the foxy-red colour of the upper parts, blue face and white belly. Scientifically it is known as Cercopithecus (Erythrocebus) patas, and typifies a section of its genus of which the other representative is the East African nisnas (C. [E.] pyrrhonotus). See PATTABHI-SVASTHI.

PATAVIUM (mod. Padova, Eng. Padua, q.v.), an ancient city of Venetia, Italy, 55 m. E. of Verona by road. Its central position gave it great importance. One road led from it south-west to Ateste, Hostilia (where the Po was crossed) and Bononia; another east-north-east to Altinum and Concordia. It was accessible by canals from the sea, a distance of about 30 m. The old town (40 ft. above sea-level) lay and lies on a peninsula surrounded by the Bacchiglione except on the south, where it was protected by a canal. Of the bridges which cross the canals by which Padua is now intersected, four go back to Roman times. Remains of a public building, possibly belonging to the forum, were found in the centre of the modern city in making the foundations of the Cafe Pedrocchi at the south-west angle of Piazza Cavour—possibly a colonnade of fine Corinthian architecture (see P. Selvatico, Relazione dello Scavo... su la Piazzetta Pedrocchi). A large mosaic with geometric designs was also recently discovered in the centre of the city. In imperial times the town spread even farther, as is shown by the position of the town of the amphitheatre, built of blocks of local stone with brick courses, which was excavated in 1887 (G. Ghirardini in Notizie degli Scavi, 1887, 235). It measures 325 by 205 ft., and is the only Roman building of which visible remains exist. A so-called "paletta" (a bronze plate with a handle—possibly a bell or a votive axe or a simple pendant) with a figure of a horse on one side and a votive inscription on the other, belonging to the 5th or 4th century B.C., was found in 1899 at a great depth close to the church of S. Antonio (G. Ghirardini in Notizie degli Scavi, 1901, 114). The name of the town is probably connected with Padus (Po). According to the legend it was founded by the Trojan Antenor. The memory of the defeat of the Spartan king Cleonymus by the fleet of Patavium in 322 B.C. was perpetuated by Spartan spoil in the temple of Juno and a yearly sea-fight which took place on the river. On land Patavium was equally powerful (it had been able, we are told, to put 120,000 men into the field), and perpetually made war against its Celtic neighbours. Patavium acquired Roman citizenship with the rest of Gallia Transpadana in 49 B.C. Under Augustus, Strabo tells us, Patavium surpassed all the cities of the north in wealth, and in the number of Roman knights among its citizens in the census of Augustus was only equaled by Gades, which had also 500.

Its commercial importance was also great, being especially due to its trade in wool. The numerous inscriptions, however, as Th. Mommsen remarks (Corpus inscr. latin. v. 268), show remarkable dignity and simplicity and avoidance of pomposity; to this Pliny the younger and Martial testify. The importance of Patavium as a literary centre was also considerable. Livy, Q. Asconius Pedianus and Thraeea Paetus were natives of the town; and Quintilian speaks of the directness and simplicity of their diction as Patavinitas, comparing it with the artificial obscurity of the writers of Rome itself.

After the 2nd century A.D. it is hardly mentioned, and seems to have been outstripped by other cities, such as Milan and Aquileia. It was destroyed by the Lombards with fire and sword, and it was then that it lost practically all its monuments of the Roman period.

PATEL, FRAMJEE NASARWANJEE (1804-1894). Parsee merchant and philanthropist, was born in 1804, and had a sound vernacular education, with a smattering of English received in Bombay. At the age of fifteen he entered upon a business career, and its pursuit proved so congenial that by 1827 he had worked his way to a partnership in the firm of Frith, Bomanjee & Co. Banking facilities being then exceedingly scanty, such Parsees as had any capital at command acted as bankers and brokers to the rising English firms. Patel's experience enabled him in a few years to raise the status of his compatriots to the higher level of independent merchants, and he founded in 1844 a business house under the name of Wallace & Co., in which he was himself a partner with the English members of the firm. When he retired in 1858 he had amassed a large competence, and in the following year he established a firm on the same lines under the style of Framjee, Patel & Co., of which the members were some of his sons-in-law, together with English partners. Patel was not so much for his success as a merchant, as for his spirit and liberality as an educationist, reformer and philanthropist, that his name is notable in the annals of western India. He entered on his civic labours in 1837, and in all public movements figured prominently as an accredited representative of his community. As a pioneer of education, both for boys and girls, his example inspired the younger men of his time, like Dadabhai Naoroji, at one time M.P. for East Finsbury, and Naoroji Fardoonjee and Sorabjee Shapurjee Bengalee. When Mountstuart Elphinstone, during his governorship, conceived the idea of concentrating the literary and educational activity which had arisen from isolated efforts on the part of men who had themselves been brought into contact with Western culture, among his chief collaborators were Framjee Cowasjee Banjee and Framjee Patel. To their initiative was due the establishment of the Elphinstone Institution, which comprised a high school and, after some years,
a college, which continue to hold foremost rank among the similar academies since established in western India. But Mr Patel’s most remarkable public service was performed in connection with the Parsee Law Association, of which he was president. Since their exodus from Persia the domestic affairs of the Parsees had been in a very unsettled state. Matrimonial obligations and the rights of succession in cases of intestacy had fallen into hopeless confusion, and the adjudication of disputes in relation thereto was effected by certain elders of the community, who had neither the knowledge and help of fixed principles to guide their judgments, nor any authority to enforce their decisions. The case of Ardesir Curseljee v. Peerzadeh, which came up on appeal before the privy council in England, brought to light the strange fact that even the supreme court of Bombay had no jurisdiction over matrimonial and ecclesiastical disputes among Parsees. This state of lawlessness was recognized by that community as intolerable, and the agitation which ensued thereupon led to the appointment of a commission, of which the distinguished jurist, Sir Joseph Arnould, was the president and Framjee Patel the chief Parsee member. The Parsee Law Association, under the guidance of Patel and Sowjee Benegal, rendered invaluable help to the commission, and their joint efforts resulted in the passing by the government of India of the Parsee Marriage and Divorce Act and the Parsee Intestate Succession Act (15 and 21 of 1865). These acts form the charter of matrimonial and ecclesiastical status for the Parsees. At the time of his death in 1894, at the ripe age of nearly ninety years, Framjee Patel was the most revered and best beloved of the distinguished natives of India, having during an eventful public life extending over sixty years worked in co-operation with three generations of the most prominent of his compatriots to better the condition of their country. His family surname refers to the title of Patel, that is, "major," of Bombay, conferred on its founder for services rendered to the English in 1692.

PATÉN (through the Fr. from Lat. paena or patena, Gr. παράτρυχον, a flat dish), the name of the shallow plate or dish used in the celebration of the Eucharist for the consecrated bread or wafer. The paten has from the first been almost always of a circular shape. There is a rare example of a rectangular one, dating from the 7th century, in the Cabinet des Médailles in Paris. The central portion of the paten is sometimes decorated with the engraved head of the Saviour, or commonly with a group of lobes.

PÂTENÔTRE DES NOYERS, JULES (1845– ), a French diplomatist, was born at Baye (Marne) on the 20th of April 1845. Educated at the École Normale Supérieure, he taught for some years in the lycée at Algiers before he joined the diplomatic service in 1871. His most important mission was in 1884, when he was sent as French minister to China to regularize the French dominion in Annam. After arranging at Huê with the king of Annam the condition of the French protectorate, he proceeded to Shanghai to settle with China the difficulties which had arisen over the evacuation of Tongking by the Chinese troops. The negotiation failed, and the French admiral resumed hostilities against China in August. Next year Pâtenôtre signed with the young Chinese treaty of peace at Tien-Tsin, by which the French protectorate in Annam and Tongking was recognized, and both parties agreed to remain within their own borders in the future. After serving as minister plenipotentiary in Morocco (1888–1891), M. Pâtenôtre was sent to Washington, where he was raised to the rank of ambassador in 1893. He was ambassador at Madrid from 1897 to 1902.

Pierre Loi in Au Maroc has described his diplomacy in Morocco. M. Pâtenôtre himself published some reminiscences in the Revue des deux mondes.

PÂTENTS, properly documents conferring some privilege, right, &c., short for "letters patent" (q.v.). Patents for inventions, instruments which formerly bore the great seal of the United Kingdom, are now issued at the Patent Office in London under the seal of that office. By their means inventors obtain a monopoly in their inventions for fourteen years, a term which, if insufficient to remunerate the inventor, can be extended. This monopoly is founded on exactly the same principle as the copyright enjoyed by authors and artists. There are persons who argue that no such privilege should be permitted; there are others who think that the most trifling exertions of the inventive faculties should be protected. The right course clearly lies between these extremes. To grant a very long term of exclusive possession might be detrimental to the public, since it would tend to stop the progress of improvement. A limited property must therefore be allowed—large enough to give the inventor an opportunity of reaping a fair reward, but not barring the way for an unreasonable period. And, when this compromise has been decided on, it will be seen how difficult it may be to determine beforehand what is the real merit of an invention, and apportion the time to that merit. Hence it has been found necessary to allot one fixed period for all kinds of inventions falling within the purview of the patent laws.

United Kingdom.—Formerly the reigning prince considered himself entitled, as part of his prerogative, to grant privileges of the nature of monopolies to any one who had gained his favour. These grants became so numerous that they were oppressive and unproductive, and passed to various classes of the commonwealth; and hence, in the reign of James I, a statute was wrung from that king which declared all monopolies that were grievous and inconvenient to the subjects of the realm to be void. (See Letters Patent; Monopoly.) There was, however, a special exception from this enactment of all letters patent and grants of privilege of the "sole working or making of any manner of new manufacture within the realm to the true and first inventor of such manufacture, which others at the time of making such letters patent and grants should not use, so they be not contrary to law, nor mischievous to the state by raising of the prices of commodities at home or hurt of trade or generally inconvenient." Upon these words hangs the whole law of letters patent for inventions. Many statutes were afterwards passed, but these were all repealed by the Patent Act of 1883 (46 & 47 Vict. c. 57), which, besides introducing a new procedure, modified the law in several particulars. Subsequently acts amending the law were passed in 1886, 1888, 1901, 1902 and 1907. These acts, with the exception of certain sections of the act of 1883, were repealed by a consolidating act, the Patents and Designs Act 1907, which also introduced new provisions into English patent law. Where the law is not expressly laid down by act of parliament, it has to be gathered from the numerous decisions of the courts, for patent law is to no inconsiderable extent "judge-made law."

The inventions for which patents are obtained are chiefly either vendible articles formed by chemical or mechanical operations, such as cloth, alloys, vulcanized india-rubber, &c., or machinery and apparatus, or processes. It may be remarked here that a scientific principle cannot form the subject of a valid patent unless its application to a practical and useful end and object is shown. An abstract notion, a philosophical idea, may be extremely valuable in the realm of science, but before it is allowed to form a sound basis for a patent the world must be shown how to apply it so as to gain therefrom some immediate material advantage. With regard to process patents, the language of the law required that they be restrained to bring them within the words "any manner of new manufacture," and judges on the bench have admitted that the exposition of the act has gone much beyond the letter. However, it is undoubted law that a process is patentable; and patents are accordingly obtained for processes every day.

The principal classes of patentable inventions seem to be these: (1) new contrivances applied to new ends, (2) new contrivances applied to old ends, (3) new combinations of old parts, whether relating to material objects or processes, (4) new methods of applying a well-known object. With regard to a patent for the new application of a well-known object it may be remarked that there must be some display of ingenuity, some amount of invention, in making the application, otherwise the patent will be invalid on the ground that the subject-matter is destitute of novelty. For example, a fishplate, used before the introduction of railways to connect
wooden beams could not be patented to connect the rails of a railway (Harwood v. Great Northern Railway Co., 1860-1862, 11 L. C. 654); nor can a spring long used in the rear of a carriage be patented for use in the front (Morgan v. Windsor, 1890, 7 R. P. C. 131). But a small amount of invention will suffice, so long as the improvement is manifest, either as saving time or labour (Rickmann v. Thierry, 1896, 14 R. P. C. 105: Patent Exploitation, Ltd. v. Siemens & Co., 1904, 21 R. P. C. 549).

Whatever be the nature of the invention, it must possess the incidents of utility and novelty, else any patent obtained in respect of it will be invalid. The degree of utility need not, however, be great. As to novelty, this is the rock upon which most patents split; for, if it can be shown that other persons have used or published the invention before the date of the patent, it will fall to the ground, although the patentee was an independent inventor deriving his ideas from no one else. The difficulty of steering clear of this rock will be apparent at once. Suppose A in London patents an invention the result of his own ingenuity and patient study, and it afterwards appears that B, in some distant part of the kingdom, had been previously openly using the same thing in his workshop, A's patent is good for nothing. Thursday and Saturday, was it proved, that lock, which a similar lock had been in use on a gate adjoining a public road for sixteen years prior to the patent, which was accordingly invalidated (Carpenter v. Smith, 1842, 1 Web. P. C. 540). It is therefore a very frequent subject of inquiry, whether an invention has been previously used to such an extent as to have been publicly used in the sense attached by the courts to this phrase. But whereas "user" in public is sufficient prior publication to invalidate a subsequent patent for the invention so used, publication in books, &c., will not be a bar to novelty unless its effect is to make the invention actually a part of public knowledge; and in dealing with alleged anticipations by patents that have never come into general use the courts will not invalidate a subsequent patent unless a person of ordinary knowledge of the subject, on having the alleged anticipation brought under his notice, would at once perceive, understand, and be able practically to apply the invention without making experiments or seeking for further information. The inventor himself is not allowed to use his invention, either in public or secretly, with a view to profit, before the date of the patent. Thus, if he manufactures an article by some new process, keeping the process an entire secret, but selling the produce, he cannot afterwards obtain a patent in respect of it. If he were allowed to do this he might in many cases easily obtain a monopoly in his invention for a much longer period than that allowed by law (Morgan v. Seaward, 1837, 1 Web. P. C. 102). The rule that an inventor's use of the invention invalidates a subsequent patent does not, however, apply to cases where the use was only by way of experiment with a view to improve or test the invention (Elías v. Grovesend Tinplate Co., 1890, 7 P. O. R. 466). And it has been repeatedly decided that the previous experiments of other persons, if incomplete or abandoned before the realization of the discovery, will not have the effect of vitiating a patent. Even if the specific invention was an accidental discovery or even if another independent discovery was made before obtaining a valid patent if the earlier inventor kept the secret to himself, the law holding that he is the "true and first inventor" who first obtains a patent.

The Patents Act 1883 provided that the exhibition of an invention at an industrial or international exhibition certified as such by the Board of Trade, or the publication of any description of the invention during the period of the holding of the exhibition, or its use for the purpose of the exhibition in the place where it is held, or during the period of the exhibition by any person elsewhere, without the priuity or consent of the inventor, should not prejudice the right of the inventor or of his legal personal representative to apply for and obtain a patent, or the validity of any patent granted on the application, provided that two conditions are complied with, viz. (a) the exhibitor must, before exhibiting the invention, give the Comptroller-General a prescribed notice of his intention to do so; and (b) the application for the patent must be made before or within six months from the date of the opening of the exhibition. The Patents Act 1856, enabled the Sovereign, by order in council, to extend the provision above mentioned to industrial and international exhibitions held out of the United Kingdom. The act of 1897 re-enacted these provisions (§§ 45, 59). When an invention is the joint production of more persons than one, they must all apply for and obtain a joint patent, for a patent is rendered invalid on showing that a material part of the invention was due to some one not named therein. The mere suggestion of a workman employed by an inventor to carry out his ideas will not, however, require that he should be joined, provided that the former adds nothing substantial to the invention, but merely works out in detail the principle discovered by his employer.

Procedure.—The attributes of novelty and utility being possessed in due degree by an invention, it remains to put in motion the machinery of the act for obtaining a patent. To effect this, the former provisions, requires an application to be made in a prescribed form (the forms and stamps are on sale at all postal money order offices in the United Kingdom), and left at or sent by post to the Comptroller-General of the Patent Office. The application must contain a declaration that the applicant is the true and first inventor, and it must be accompanied by either a provisional or complete specification. A provisional specification describes the invention, and may be filed before the completion of the patent. It also describes and ascertains the nature of the invention and the manner in which it is to be performed. Since the introduction of the patent specification, it has been necessary that an invention proposed to be patented should be accurately described. Formerly, when the condition on which letters patent issued was that the patentee should file a specification completely describing the nature of his invention within a certain time after the grant, he frequently used the time to elapse in标的 principle purpose was to prevent persons who have precedents to the invention from making or using the invention, whilst the subject was to some extent discharged by the title; at any rate, the validity of the grant was liable to be objected to on the ground of the title being too general. Under the present law the task of preliminary disclosure may be divided, and the claim for the patent being invalidated by premature publication. He is therefore entitled to embody in his complete specification any improved method of working his invention which he may discover in the interim, and to patent his invention accordingly. If it be said, the price that a man who desires a patent has to pay to the public for the privilege is that he should make a full disclosure of his invention in his complete specification. But there is a limitation to this when an invention is not complete; that is to say, the specification in complete specification an invention different from that declared in the provisional. If he falls into this error there is said to be a "variance" or "disconformity" between the two specifications. The Patents Act 1883, § 9, made it the duty of the examiners of the Patent Office to consider the question of disconformity between specifications on applications for patents, but the only power the comptroller had, on discovery of disconformity, was to refuse to accept the specification until such disconformity was remedied. The act of 1907, § 6, may now refuse to accept the complete specification until it has been amended to his satisfaction, or (with the consent of the applicant) cancel the specification altogether. An invention having been made on the date at which the complete specification was left. Moreover, if the complete specification includes an invention not included in the provisional specification, the application may still be refused. The case of 1858 throws light on the whole, even when the applicant has filed an additional invention included in the complete specification be regarded as an application for that invention made on the date at which the complete specification was left. An act of 1902 (which, with the exception of a portion dealing with compulsory licences, is in the nature of a new patent system) was provided for examination or search as to novelty, such investigation dealing with British complete specifications published and dated within fifty years prior to the date of the application. This search was made under the act by the Comptroller-General and power given to the comptroller to refuse the grant of a patent in cases in which the invention had been wholly and specifically claimed in specifications to which his search had extended. The term for which a patent is originally granted is fourteen years, but a patentee may, after advertisement according to the rules of the Supreme Court, petition for a further term. The court, in considering its decision, takes regard of the nature and merit of the invention in relation to the public, of the profits made by
the patentee as such, and of all the circumstances of the case. If it
appears to the court that the patentee has been inadequately
remunerated by his patent, it may extend the term of the patent
to a further term not exceeding seven or, in exceptional cases,
fourteen years, power of the grant of a new patent in the same
term, with any restrictions or provisions it may think fit (Act of
1907, § 18).
Patent privileges, like most other rights, can be made the subject
of sales or assignment. A patentee can also, by means of licences,
transfer to a third party the right to use the invention, either
individually or for the full time of the patent. When they are
translated into an assignation of the patentee's entire
right, his gift or sale is called a full licence. For a limited
period, an exclusive licence may be given. By an exclusive
licence you mean the power to restrain the patentee from
granting other licences to any one else. By means of a licence
a patentee may derive benefit from his patent without entering
into the details of the invention. There can be no infringement
by such licences.
One of the regulations of the act of 1883 was that a patentee
might be compelled by the Board of Trade to grant licences to persons
who showed that the patentee was not being worked in the
United Kingdom, either because the patentee was unable to
secure this right, or, if the patentee was working it, to
provide respect to the invention could not be supplied, or that
any person was prevented from working or using to the best
advantage an invention of which he was possessed. This
regulation, however, remained practically a dead letter, for
the Board of Trade never proceeded to a hearing. After
1897 a few petitions were heard, but a few were filed in 1908
where only one petition was heard and that was
withdrawn by agreement between the parties. It is still
the case that no assistance is given to the person who
asks that a patentee should be compelled to grant
licences. The years 1883, 1897 and those never
proceeded to a hearing. After 1897 a few petitions were heard, but
for the first time in 1908 one petition was heard and that was
withdrawn by agreement between the parties. It is still
the case that no assistance is given to the person who
asks that a patentee should be compelled to grant
licences. The years 1883 and 1897, these have
never proceeded to a hearing. After 1897 a few petitions were heard, but
for the first time in 1908 one petition was heard and that was
withdrawn by agreement between the parties. It is still
the case that no assistance is given to the person who
asks that a patentee should be compelled to grant
licences. The years 1883 and 1897, these have
never proceeded to a hearing. After 1897 a few petitions were heard, but
for the first time in 1908 one petition was heard and that was
withdrawn by agreement between the parties. It is still
the case that no assistance is given to the person who
asks that a patentee should be compelled to grant
licences. The years 1883 and 1897, these have
never proceeded to a hearing. After 1897 a few petitions were heard, but
for the first time in 1908 one petition was heard and that was
withdrawn by agreement between the parties. It is still
the case that no assistance is given to the person who
asks that a patentee should be compelled to grant
licences. The years 1883 and 1897, these have
never proceeded to a hearing.
1891) the care of the register of patent agents and the duty of holding the necessary examinations for entrance into the profession.

British Dominions.—The following notes on colonial law give the salient facts. Prior to 1852 British letters patent extended to all the colonies, but the act of 1852 restricted the rights granted to the United Kingdom, Channel Islands and Isle of Man.

Australia.—The Commonwealth Acts are No. 21 of 1903, and No. 19 of 1906. They are founded on the English Act of 1883 and amendments. They provide for a department of patents controlled by a commissioner of patents (§ 8). Any person, whether a British subject or not, may apply for a patent (§ 32 of 1903). The term of a patent is 14 years (§ 64 of 1903). The Commonwealth or a state may acquire patents compulsorily (§§ 93, 94 of 1903). The act creates a new class of provisional patents (§ 77 of 1903), to which are appended new regulations for patenting inventions abroad (§ 81 of 1903). The renewal fees amount to a sum of £5 before the end of the 4th year, and £5 before the end of the 7th year from the date of the patent.

British India is regulated by the following acts of the colony: 52 Vict. c. 23; 53 Vict. c. 2; 54 Vict. c. 121; and 63 Vict. c. 3. Duration of patent 7 years, with power in governor to renew for another 7 years, and thereafter for a third period of 7 years. The fee is £2 10s. on filing, £50 for second renewal and £20 for third. Apparently there is no preliminary examination as to novelty.

Barbadoes.—Acts of 1903 (No. 31) and of 1908 (No. 10). Duration of patent 14 years. The governor in council has power to grant compulsory licences. Fees are £2 10s. on filing specification, £50 before the end of the 4th year and £100 before the end of the 7th year. No preliminary examination as to novelty.

British Guiana.—No. 80 of 1902. The act gives the right of appeal to a court of Trinidad.

The law is regulated by ordinance No. 31 of 1902 and is practically the same as the English act of 1883. The fees are £15 on filing specification and £100 before the end of 7 years.

British Honduras.—The law of the 10th of September 1862 has been re-enacted with slight modifications (see supplement to Patent Laws of the World, No. 4, 1900). There is no examination as to novelty.

British India.—The law is now governed by Act 5 of 1888, which applies to the whole of British India. Duration of patent is 14 years. A preliminary examination into novelty might apparently be obtained. The following taxes are payable: annual sums of Rs. 50 from the 4th to the 8th year, and of Rs. 100 from the 8th to the 13th year of the term.

British New Guinea.—The Queensland Patents Acts, No. 13 of 1884, and No. 5 of 1886, have been adopted. See British New Guinea Ordinance No. 6 of 1889, for obtaining letters patent, and for the term of 12 years (§40). If a partial fee only is paid, the amount is stated in the patent, and the patent ceases at the end of the term covered by such partial payment, unless before the expiration of the 6th year from the date of the specification an application is made for the term of 6 years, or for the term of 12 years (§40). If a partial fee only is paid, the amount is stated in the patent, and the patent ceases at the end of the term covered by such partial payment, unless before the expiration of the 6th year from the date of the specification an application is made for the term of 6 years, or for the term of 12 years (§40). The patent is void unless it is worked in Canada within 2 years, or if after the expiration of 12 months, or any authorized extension of either of these periods, the patentee imports the invention into Canada, or if made or manufactured in Canada. An application for an extension of time is made to the department of patents in Canada, and, as, for example, a licence to another to manufacture, &c.

Cape of Good Hope.—The law is regulated by act No. 17 of 1860, No. 6 of 1867, No. 28 of 1869, and No. 12 of 1886. Any person, subject to the provisions of the act, may apply for a patent (§ 2). The term of a patent is 14 years (§ 64). There is no preliminary examination as to novelty, and the act contains no provisions for compulsory working, or as to the importation of patented articles from abroad.

The law is now regulated by act 15 of 1906. The duration of the patent is 14 years, with power vested in the governor in council to grant extensions of 7 and 14 years. There is a preliminary examination as to novelty, but there are no provisions as to compulsory working or the importation of patented articles from abroad. Provisional patents are granted, the fee is £50. No oath or affidavit is necessary for obtaining a patent. Any person, whether a British subject or not, may apply for a patent (§ 32 of 1906). No prohibition of the importation of patented articles. The fee for signing and sealing the patent was not less than £10 nor more than £50. Taxes of £5 and £10 were payable before and after the expiration of the 3rd and 7th years of the term respectively.

Niger, Northern.—No. 12 of 1902 introduces practically the English law of 1883.

Orange River Colony.—Up to the outbreak of war in 1899 the law was regulated by ordinance No. 10 of 1888 and no change has yet been made. The term of a patent was 14 years. No preliminary examination or novelty, and no provisions as to compulsory working or the importation of patented articles. The fee for obtaining a patent was £5, and £10 for sealing and signing the patent. There are no provisions as to compulsory working or importation from abroad. The patent is not subject to any payment after six years. A fee of £5 is payable on petition and specification. The fee for proving the priority of another is £100. On obtaining letters patent the applicant pays £100. No prohibition of the importation of patented articles. The fee for signing and sealing the patent was not less than £10 nor more than £50. Taxes of £5 and £10 were payable before and after the expiration of the 3rd and 7th years of the term respectively.

Rhodesia, Southern.—Ordinance No. 7 of 1904 adopts practically the English law.
St Helena.—The law is regulated by ordinance No. 3 of 1872. The grantee of an English patent, or his representatives, can have the grant extended to the colony. All cases of doubt and difficulty not provided for by the laws of the colony are governed by the law of France. A fee of 10 florins is payable on filing a copy of letters patent and specification with the registrar of the Supreme Court.

Sierra Leone.—No special regulations exist, but an ordinance provides that the patent of the Gold Coast is binding in the Colony. The law is regulated by ordinance No. 12 of 1871. The duration of a patent is 14 years. There is no preliminary examination as to novelty, and there are no provisions as to compulsory working or importation from abroad.

Straits Settlements.—The law is prescribed by ordinance No. 10 of 1900 and No. 13 of 1905. The duration of the patent is 14 years. There is no preliminary examination into novelty, and there are no provisions as to compulsory working or importation from abroad. There is a stamp duty of £50 on the petition. No renewal fees are payable.

Transvaal Colony.—Proclamations Nos. 22 and 29 of 1902 introduce substantially the English law.

Turks and Caicos Islands.—The law of Jamaica has been extended to these islands by No. 7 of 1897. See supplement to Patent Laws of the World, ed. 1890 and supplemental volumes. But the following are the essential facts.

Algeria.—French law applied by decree of June 5, 1850, by which patents were granted to French and English inventors. See also decree of May 5, 1854. Patents are granted as in France, except novelty is examined at the time of filing.

Austria.—A law of January 11, 1897, came into force on January 1, 1899. The principal changes introduced by this measure are: (1) the duration is fixed at 20 years; (2) there is no compulsory working; (3) the schedule for the calculation of fees is substantially reduced; (4) there is no examination for novelty; (5) the publication of the grant is made compulsory; (6) the period for opposition is extended to 3 years; (7) the period for the payment of the annuities is reduced to 10 years; (8) the period of the patent is fixed by the date of the publication of the grant of the patent in the patent journal. Provision was made for the conversion of patents under the old law of August 18, 1852 (extended to Hungary by law of June 27, 1875) and to Bosnia and Herzegovina law of December 20, 1879) into patents under this present law.

Belgium.—The law is still governed by the law of May 24, 1845. Patents are granted as in France, without guarantee of novelty.

Bolivia.—The patent law depends on a law of May 8, 1858, which is in force. The duration of the grant is in the case of a patent of invention not less than 10 nor more than 15 years; in the case of an improvement not less than 5 years. The legal fees for obtaining a patent is fixed at 25,000 pesos, if it is for the latter, 50,000 pesos, if it is for the former. The examination of the novelty of a patent is left to the court of law. The patents issued are without guarantee of novelty or utility. No opposition to the granting of patents is admitted. The duration of a patent and the terms of payment of annuities are the same as in France, but the extent of the annuities is much more reduced. The examination of the novelty of a patent is left to the court of law. The patents issued are without guarantee of novelty or utility. The duration of a patent is 15 years. There is no examination as to novelty. There are no oppositions as to the number of the patent.

Brasil.—Patents are granted under the law of October 14, 1882. The patent lapses unless the invention is brought into effective use within 2 years from the date of the grant, if such use is suspended for more than a year, except by reason of force majeure admitted by government to be a sufficient excuse. Besides expenses and fees, patents of invention are subject to an annual and progressive tax, increasing at the rate of 1% annually. The patents issued are without guarantee of novelty or utility. The duration of a patent is 15 years. There is no examination as to novelty. Though the duration of a patent does not ordinarily exceed 10 years, the term may be extended to 20 years by the president of the republic, if the report of the experts on the necessity of the extension is favorable to that effect. There are no oppositions as to importation from abroad.

Chile.—The law is regulated by the law of September 9, 1840, decree of October 14, 1851, and law of July 25, 1872, January 20, 1883, and law of December 18, 1888. The patent is valid for 11 years from the filing date of the application, and may be extended for 4 years. There is a preliminary examination as to novelty and utility. Though the duration of a patent does not ordinarily exceed 10 years, the term may be extended to 20 years by the president of the republic, if the report of the experts on the necessity of the extension is favorable to that effect. There are no oppositions as to importation from abroad.

Colombia.—Patents are granted under law No. 35 of 1869 and decree No. 218 of 1900. The term varies from 5 to 10 years at the option of the patentee. There is a preliminary examination as to novelty. There is no opposition as to importation from abroad. A patent for a new industry is void if such industry is idle for a whole year, unless circumstances have intervened. An applicant pays a sum of 20 pesos which is forfeited if the patent is refused, and taken in part payment of the patent fee if it is granted. The patent tax is from 5 to 10 pesos a year for every year of the专利.
The maximum duration of the patent was 10 years. On application a fee of $5 was payable, and the commissioner of patents received $20 for his examination, and a fee of $5 was payable when the patent was issued. No further payments. Now the United States law applies. 

Spain.—Patents are issued under the law of June 7, 1902. There is no preliminary examination as to novelty, and no importation of patented articles is not prohibited. The duration of a patent is 20 years, and it is subject to an annual and progressive tax, as follows: 10 pesetas for the first year, 20 for the second, 30 for the third, and 50 for each of the remaining 17 years. There is a preliminary examination as to novelty, the period for compulsory working is 3 years, and discontinuance during any entire year entails forfeiture. There is no provision for remission for the 3rd or 4th years.

Sweden (law of May 16, 1884).—The term is 15 years. The annual tax is 25 crowns for the 2nd, 3rd, and 5th years; 50 crowns for each of the following 5 years; and 75 for each of the remaining 5 years. There is a preliminary examination as to novelty, the period for compulsory working is 3 years, and discontinuance during any entire year entails forfeiture. There is no provision for remission for the 3rd or 4th years.

Switzerland.—Federal law of June 21, 1897. The term of the patent is 15 years. There is an annual and progressive tax, which after a year's franchise of 10 francs up to 160 francs for the 15th. There is no preliminary examination as to novelty, the period for compulsory working is 3 years, and discontinuance during any entire year entails forfeiture. There is no provision for remission for the 3rd or 4th years.

Turkey.—Patents are still granted under the law of the 2nd of March 1880. There is no preliminary examination as to novelty, and a patentee who mentions his title as such without adding the words "patent on inventions," is liable to a maximum penalty of 45 thousand pounds.

United States.—The American law may be considered at greater length. The Federal Constitution empowered Congress "to promote the progress of science and useful arts by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries." The existing American patent law is based on a series of Acts of Congress passed in virtue of this provision in the Constitution, and on the judicial interpretation of these statutes. Between American and English patent law, there is a considerable degree of similarity. The fact is not surprising when it is remembered that the Statute of Monopolies (21 Jac. I. c. 3) was, except in limiting the maximum duration of letters patent for inventions at fourteen years, only declaratory of the common law; and therefore formed part of the original common law of America. The English and American patent systems further agree in this, that they contain no provision for a "disclosure" of an invention prior to the laying down of the patent, and the publication of the description of patented articles. But there are important differences between the two systems, not merely in points of detail, but in matters affecting the theory and practical working of the law. In England the Statute of Monopolies for the first time laid down any rules as to the benefit which the public derives from the introduction of a new manufacture. In America greater emphasis is placed on the right of an inventor to have his merits rewarded. Again, under the Statute of Monopolies an inventor's exclusive privilege arises only in regard to inventions not known or used at the date of the grant, although it should be observed that under the modern Patents Acts the date of a patent, once granted, relates back to the date of the application. In the United States, on the other hand, the right is conferred on inventors to an exclusive privilege in such inventions as were not known or used before their discovery by the patentee. The practical bearing of this difference is the same as that of an additional and important "renewable." Patent (xx: 5): "It shifts the point of view in the important question of novelty. Many good American inventions have been given away in England by the premature publication of them in American papers, and in articles in the New York Sun, or some other paper, in due time finds its way to England. This does no harm in America; on the contrary, it is good evidence of the date of the discovery. But it is fatal to a subsequent application in England." The definition of patentability in American law is contained in sect. 4886 of the Revised Statutes of the United States as amended by Act of July 17, 1891, c. 552, 26 Stat. 258. In the following pages the amendments are indicated by italics: "Any person who has invented or discovered any new and useful art, machine, manufacture or composition of matter, or any new and useful improvement thereof, not previously used by others in this country before his invention or discovery thereof, and not patented or described in any printed publication in this or any foreign country before his invention or discovery thereof or more than two years prior to his application, and not in public use or on
sale for more than two years prior to his application, unless the same is proved to have been abandoned, may, upon payment of the fees required by law and other proceedings had, obtain a patent therefor.

The effect of the two amendments made by the act of 1897 should first be noted. General law failed to state what the invention should be known or used by others in America so as to bar a patent; whether before the application or before the invention. This ambiguity is removed by the use of the words "his discovery" in the 1897 act. Under 1897 law a foreign patentee could take out a patent in America for the same invention at any time during the life of the foreign patent, provided it had not been in use in America more than two years prior to the application. An invention may be patented in America in spite of the fact that the patentee was a citizen of both the United States and the foreign country. Utility may be evidence of novelty and vice versa, and commercial success is relevant evidence of utility. In England, a bare principle is not patentable. A "process" is included under the words "useful art" in the above definition of patents, and a "process" is subject matter for a patent when the term is used to effect a practical method of producing a beneficial result or effect. The word "machine" in the definition includes every mechanical device or combination of devices for producing a certain result or effect. So far as combination is concerned, it is when the product and novelty, and produces either a new result or an old result in a better form.

Under the law of 1790, which was exclusively American in spirit, the exclusive right of an inventor was vested in the United States by the secretary of state, the secretary of war and the attorney-general, or any two of them. The law from 1793 to 1836 was exclusively English in spirit, and during that period the duty fell to the secretary of state, subject to the advice and consent of the cabinet.

It was in 1828 that the marked divergence between the English and American patent system began. In that year the patent business of the United States had attained to such dimensions that the powers and duties of the secretary of state in regard to patents were transferred to a sub-department of the state department, known as the Patent Office. The American Patent Office consists of a commissioner of patents, one assistant commissioner, and three examiners-in-chief, who are appointed by the President of the United States. It is the duty of the commissioner to decide questions of others examiners, and a staff of officers, clerks and employees, appointed by the secretary of the interior on the nomination of the commissioner of patents. The commissioner of patents, under the direction of the interior, is charged with the administration, supervision, or performance of all duties respecting the grant and issue of patents, and has the control and custody of all books, records, papers, &c., belonging to the Patent Office. He is authorized to make rules and regulations, and to appoint employees, for the conduct of proceedings in the Patent Office, and prepares an annual report which is laid before Congress, and which is framed on the same lines as that of the comptroller-general in English practice. The commissioner is charged with the duty of determining, of all controverted questions arising in the office, and in granting or withholding patents he is not bound by the decisions of his inferiors (Robinson on Patents, 1842). The examiners-in-chief are responsible for the advice and consent of the commissioner, and discharges similar functions to those of the English Patent Office in regard to the public dissemination of information as to patented inventions.

The number of original applications for patents in the United States has been given in the table of the number of patents granted, from 1906-1997 was 8,762; the number of patents granted was 36,620; the receipts amounted to $1,910,618, the expenditure to $1,631,458, leaving a surplus of $279,156.

The first step in the procedure to obtain a patent is the lodging at the Patent Office of a written application, together with a specification of particular written description of his invention, and a claim distinctly pointing out and claiming what he alleges to be his invention or discovery. The specification and claim must be executed in writing and signed by the inventor. Drawings, specimens of ingredients, and models may be required to be furnished. On the filing of each original application for a patent, a fee of $15 is payable. The applicant is required to verify the petition in writing, and no application is received or accepted until such verification is made.

The commissioner of patents then causes an examination to be made into the novelty of the invention, and if the result is satisfactory the patent issues. On the issuing of each original patent, a fee of $20 is payable. A patent is issued in the name of the patentee by the Patent Office. It consists of a short title or description of the invention or discovery, correctly indicating its nature and design, and a grant to the patentee, his heirs and assigns. Patents, it is declared in the act of 1897, "have effect abroad, and may be issued to the assignee of the inventor or discoverer, and every patent or any interest in it is assignable, the assignment being recorded in the Patent Office, for the term of seventy years, of the life of the inventor and twenty years thereafter. The right of the patent to make, use, sell, and vend, within the United States and the territories thereof. The rights of property in patents granted in Cuba, Porto Rico, the Philippines and other ceded territory under Spanish law are to be respected by those who are in force of patents granted in these countries. A patent is dated as of a day not later than three months from the time at which it was passed, and if the fee is not paid within six months the patent is withheld. In case the patent is filed more than seven months before the filing of the application to pay the fee within the prescribed period, the application may be renewed within two years after the allowance of the original application. But the applicant has no right to damages for any use of the invention in the interval, and on the hearing of the case for the cancellation of the application no penalty is imposed.

Section 488 of the revised statutes provides that:

No person otherwise entitled thereto shall be debarred from receiving a patent for an invention which has not been patented in the United States or granted abroad a longer period than the term of the patent. If the invention has not been patented within the United States or granted abroad a longer period than the term of the patent, it shall be debarred invalid by reason of its having been first patented or caused to be patented by the inventor or his legal representatives or assigns in a foreign country, unless the application for the said foreign patent was filed more than seven months before the filing of the application for the patent in this country, in which case no patent shall be granted in this country.

The words italicized in the above section were added by an Amendment of 1897. In its original form the provision provided that no person should be debarred from receiving a patent because the invention was first patented in a foreign country, whether he was otherwise entitled to the patent or not. The words "other-
notice; and in any suit for infringement by a party failing so to mark, no damages shall be recovered by the plaintiff, except on proof that the defendant was duly notified of the infringement, and continued after such notice to make, use or vend the article so patented. A penalty of not less than two dollars or a fee of $30, issue a new patent in accordance with the amended specification.

Venezuela.—A new law was promulgated by a decree of the 19th of March 1900, but revoked in January 1901 and the old law of 1882 substituted. The term is 5, 10 or 15 years. The tax is 60 francs or 5, 10 or 15 per cent of the value of the article. The fee for a new patent is 60 francs and 60 francs (bolívares) a year if it relates to an improved process. There is no preliminary examination as to novelty, nor is there any compulsory working.

International Patents.—The International Convention for the protection of industrial property was signed at Paris on the 20th of March 1883; the necessary ratifications were exchanged on the 6th of June 1884, and the Convention came into force a month later. Provision was made by sections 103 and 104 of the Patents Act 1883 for carrying out the Convention in Great Britain by orders in council, applying it from time to time to (a) British possessions whose legislatures had made satisfactory arrangements for the protection of inventions patented in Great Britain; (b) foreign states with which the sovereign had made arrangements for the mutual protection of inventions. The following governments have signed the international convention: Australia, Austria-Hungary, Belgium, Brazil, Ceylon, Cuba, Denmark, France, Germany, Italy, Japan, Mexico, Netherlands, New Zealand, Norway, Portugal, San Domingo, Servia, Spain, Sweden, Switzerland, Trinidad and Tobago, Tunis and the United States. Under the powers of the Foreign Jurisdiction Act 1890 penalties have been imposed on British subjects committing infringements against the Patents, &c., Acts 1883-1888, and the orders in council issued thereunder, in Africa, East Africa, Morocco, Persia, Persian coast and Zanzibar.

An international bureau in connection with the Convention has been established at Bern, where an official monthly periodical, La Propriété industrielle, is published. Conferences were held under the Convention at Rome in April and May 1886, and at Madrid in April 1890. At the latter conference an important article was adopted, under which it is left to each country to define and apply "compulsory working" (exploitation) for the purposes of the convention in the sense that it chooses.

in the university, but among men of letters in London and elsewhere. The little body of Pre-Raphaelites were among his friends, and by the time that *Marina the Epicurean* appeared he had quite a following of disciples to hail it as a gospel. This fine and polished work, the chief of all his contributions to literature, was published early in 1885. In it Pater displays, with perfected fullness and loving elaboration, his ideal of the aesthetic life, his cult of beauty as opposed to bare asceticism, and his theory of the stimulating effect of the pursuit of beauty as an ideal of its own. In 1887 he published *Imaginary Portraits*, a series of essays in philosophic fiction; in 1889, *Appreciations, with an Essay on Style*; in 1893, *Plato and Platonism*; and in 1894, *The Child in the House*. His Greek Studies and his Miscellaneous Studies were collected posthumously in 1895; his posthumous romance of *Gaston de Lautur* in 1896; and his Essays from the "Guardians" were privately printed in 1897. A collected edition of Pater's works was issued in 1901. Pater changed his residence from time to time, living sometimes at Kensington and in different parts of Oxford; but the centre of his work and influence was always his rooms at Brassocote. Here he laboured, with a wonderful particularity of care and choice, upon perfecting the expression of his theory of life and art. He wrote with difficulty, correcting and recorrecting with imperturbable assiduity. His mind, moreover, returned to the religious fervour of his youth, and those who knew him best believed that had he lived longer he would have resumed his boyish intention of taking holy orders. He was cut off, however, in the prime of his powers. Seized with rheumatic fever, he rallied, and sank again, dying on the staircase of his house, in his sister's arms, on the morning of Monday the 30th of July 1894. Pater's life was so contemptible, and in a way so centred upon reflection, that he never perhaps gave full utterance to his individuality. His peculiar literary style, too, burnedish like the surface of hard metal, was too austere magnificent to be always persuasive. At the time of his death Pater exercised a remarkable and a growing influence among that necessarily restricted class of persons who have themselves something of his own love for beauty and the beautiful phrase. But the cumulative richness and sonorous depth of his language harmonized intimately with his deep and earnest philosophy of life; and those who can sympathize with a nervous idealism will always find inspiration in his sincere and sustained desire to "burn with a hard, gem-like flame," and to live in harmony with the highest.

Mr. H. J. Greenleaf's *Walter Pater* (in the "Contemporary Men of Letters" series, 1904) is an interesting piece of criticism. Mr. Arthur Benson's study in the "English Men of Letters" series is admirable. See too a sketch in Edmund Gosse's *Critical Kit-Kats*; and an estimate from a Roman Catholic standpoint in Dr. William Barry's *Herald of Revolt*, where Pater is compared with J. Addington Symonds. T. Wright's *Life of Walter Pater* (1907) is an elaborate but unsatisfactory piece of work.

**PATERA**, the Latin name for a shallow circular vessel used for drinking or for pouring libations. The Greek name for such a vessel was *φιάλη*. It has no foot or stem underneath, but occasionally a boss rising in the centre inside. The term is sometimes given incorrectly in architecture to a circular disk carved with a conventional rose, which is found in many early styles, the proper term being *rose*.

**PATERNO**, a town of Sicily, in the province of Catania, 11 m. W.N.W. of Catania by rail, at the southern foot of Mt. Etna. Pop. (1881), 15,230; (1901), 20,098 (town), 22,857 (commune). The castle, originally erected in 1573, upon the acropolis of the ancient Hybla Minor or Galeatais, has a square tower and a chapel with frescoes belonging to the 14th century. Among the houses in the Strada dell'Arte are some old and remains of baths and of an ancient bridge over the Simeto on the road to Centuripa are to be seen in the neighbourhood. The place was unsuccessfully besieged by the Athenian forces in the summer of 415 B.C.

**PATERSON, ROBERT** (1715-1801), Scottish stone-mason, who suggested to Sir Walter Scott the character of "Old Mortality," was born near Hawick in 1715. Through the patronage of Sir Thomas Kirkpatrick, whose cook he had married, he obtained the lease of a quarry at Gatelawbrig, but in 1745 his house was plundered by the retreating Jacobites, and Paterston himself, a pronounced Cameronian, was carried off a prisoner. He subsequently devoted his life to cutting and erecting stones for the graves of the Covenanters, for 40 years wandering from place to place in the lowlands. He died in poverty in 1801, and a stone to his memory was erected by Scott's publishers in 1869 in Caerlaverock churchyard.

**PATERSON, WILLIAM** (1658—1719), British writer on finance, founder of the Bank of England and projector of the Darien scheme, was born in April 1658 at the farmhouse of Skipmyre, parish of Tinwald, Dumfriesshire. His parents occupied the farm there, and with them he resided till he was about seventeen. A desire to escape the religious persecution then raging in Scotland, and the immemorial ambition of his race, led him southward. He went through England with a pedlar's pack ("whereof the print may be seen, if he be alive," says a pamphletier in the Bank of England, 1720) for some time in Bristol, and then proceeded to America. There he lived chiefly in the Bahamas, and is said by some to have been a predicant or preacher, and by others a buccaneer. In truth his intellectual and moral superiority to his fellow-settlers caused his selection as their spiritual guide, whilst his thirst for knowledge led to intercourse with the buccaneers. It was here he formed that vast design which is known in history as the Darien scheme. On his return to England he was unable to induce the government of James II. to engage in his plan. He went to the continent and pressed it to no purpose in Hamburg, Amsterdam and Berlin, and on his return to London he engaged in trade and rapidly amassed a considerable fortune. About 1690 he was occupied in the formation of the Hampstead Water Company, and in 1694 he lent £15,230; which, together with the bank stock, was used to found the Bank of England. The government required money, and the country, rapidly increasing in wealth, required a bank. The subscribers lent their money to the nation, and this debt became the bank stock. The credit of having formulated the scheme and persuaded its adoption is due to Paterston. He was one of the original directors, but in less than a year he fell out with his colleagues, and withdrew from the management. He had already propounded a new plan for an orphan bank (so called because the debt due to the city orphans by the corporation of London was to be formed). They feared a dangerous rival to their own undertaking, and they felt some distrust for this eager Scotsman whose brain teemed with new plans in endless succession.

At that time the people of the northern kingdom were considering how best to share in that trade which was so rapidly enriching their southern neighbours. Paterston saw his opportunity. He removed to Edinburgh, unfolded his Darien (g.z.) scheme, and soon had the whole nation with him. He is the supposed author of the act of 1665 which formed the "Company of Scotland trading to Africa and the Indies." This company, he arranged, should establish a settlement on the Isthmus of Darien, and "thus hold the key of the commerce of the world." There was to be free trade, the ships of all nations were to find shelter in this harbour not yet erected, differences of race or religion were neglected; but a small tribute was to be paid to the company, and this and other advantages would so act that, at one supreme stroke, Scotland was to be changed from the poorest to the richest of nations.

On the 26th of July 1668 the first ships of the expedition set sail "amidst the tears and prayers and praises of relatives and friends and countrymen." Some financial transactions in which Paterston was concerned were at first attended with perfect honesty, the company had lost, prevented his nomination to a post of importance. He accompanied the expedition as a private individual, and was obliged to look idly on whilst what his enemies called his "golden dream" faded away indeed like the "baseless fabric of a vision" before his eyes. His wife and child died, and he was seized with a dangerous illness, "of which, as I afterwards found," he says, "trouble of mind was not the least cause." It was noted that "he hath been so mightily concerned in this sad disaster, so that he looks now more
like a skeleton than a man." Still weak and helpless, and yet protesting to the last against the abandonment of Darien, he was carried on board ship, and, after a stormy and terrible voyage, he and the remnant of the ill-fated band reached home in December 1699.

In his native air Paterson soon recovered his strength, and immediately his fertile and eager mind was at work on new schemes. He prepared an elaborate plan for developing Scottish resources by means of a council of trade, and then tried to induce King William, with whom he had frequent interviews, to enter on a new Darien expedition. In 1701 he removed to London, and here by conferences with statesmen, by writing, and by personal persuasion helped on the union. He was much employed in settling the financial relations of the two countries. One of the last acts of the Scots parliament was to recommend him to the consideration of Queen Anne for all he had done and suffered.

The United Parliament, to which he was returned as a member for the Dumfries burghs, though he never took his seat, decided that his claim should be settled, but it was not till 1715 that an indemnity of £18,241 was ordered to be paid him. Even then he found considerable difficulty in obtaining his due. His last years were spent in Queen Square, Westminster, but he removed from there shortly before his death on the 22nd of January 1720.

As many as twenty-two works, all of them anonymous, are attributed to Paterson. These are classified by Bannister under six heads, as dealing with (1) finance, (2) legislative union, (3) colonial enterprise, (4) trade, (5) administration, (6) various social and political questions. Of these the following deserve special notice: (1) Proposals and Reasons for constituting a Council of Trade (Edinburgh, 1701). This was a plan to develop the resources of his county. A council, consisting of a president and twelve members, was to be appointed. It was to have a revenue collected from a duty on sales, lawsuits, successions, &c. With these funds the council was to revive the Darien scheme, to build workhouses, to employ, relieve and maintain the poor, and to encourage manufactures and fisheries. It was to give loans without interest to companies and shippers, to remove monopolies, to construct all sorts of vast public works. Encouragement was to be given to foreign Protestants and Jews to settle in the kingdom, gold and silver were to be coined free of charge and money kept up at its nominal standard. All export duties were to be abolished and import regulated on a new plan. Paterson believed that thus the late disasters would be more than retrieved.

(2) A Proposal to plant a Colony in Darien to protect the Indians against Spain, and to open the trade of South America to all Nations (1701). This was the Darien scheme on a new and broader basis. It points out in detail the advantages to be gained: free trade would be advanced over all the world, and Great Britain would largely profit. (3) Wednesday Club Dialogues upon the Union (London, 1760). These were imaginary conversations in a club in the city of London about the union with Scotland. Paterson's real opinions were put into the mouth of a speaker called May. Till the Darien business all Scots were for the union, and they were so still if reasonable terms were offered. Such terms ought to include an incorporating union with equal taxes, freedom of trade, and a proportionate representation in parliament. A union with Ireland, "as likewise with other dominions the queen either hath or shall have," is proposed. (4) Along with this another discussion of the same imaginary body, An Inquiry into the State of the Union of Great Britain and the Trade thereof (1717), may be taken. This was a consideration of the union, which, now "that its honeymoon was past," was not giving satisfaction in some quarters, and also a discussion as to the best means of paying off the national debt—a subject which occupied a great deal of Paterson's attention during the later years of his life.

Paterson's plans were vast and magnificent, but he was never dreamer. Each design was worked out in minute detail, each was possible and practical. The Bank of England was a splendid success. The Darien expedition stands as a host of attacks and bad arrangements. But the original design was that the English and Dutch should be partners in it, and, if this had occurred, and the arrangements, against many of which Paterson in letter after letter in vain protested, had been different, Darien might have been to Britain another India. Paterson was a zealous almost a fanatic free-trader long before Adam Smith, and his remarks on finance and his argument against an inconvertible paper-currency, though then novel, now hold a place of economic orthodoxy. Paterson's works are excellent in form and matter; they are quite impersonal, for few men who have written so much have said so little about themselves. There is no reference to the scurrilous attacks made on him. They are the true products of a noble and disinterested as well as vigorous mind. There is singular fitness in the motto "Sic vos non vobis" inscribed under the only portrait of him we possess.

See Life of W. Paterson, by S. Bannister (Edinburgh, 1858); Paterson's Works, by S. Bannister (3 vols., London, 1859); The Birthplace and Parentage of W. Paterson, by W. Pagan (Edinburgh, 1865); Eng. Hist. Review, xi. 260. The brilliant account of the Darien scheme in the fifth volume of Macaulay's History is incorrect and misleading; see Macaulay, History of Darien, iii. 374. (1745-1806), 125,000. The total in 1800 was 1,791 were foreign-born. Paterson is served by the main lines of the Delaware, Lackawanna & Western, the Erie, and the New York, Susquehanna & Western railways, and by a number of interurban electric lines. The Morris Canal was formerly important for shipping freight between Paterson and Jersey City, but has fallen into disuse. The city lies along a bend of the Passaic river, the southern portion being in a plain and the extreme northern part lying among the hills that rise from the stream near the Great Falls. The river has a descent here of about 70 ft. (of which 50 ft. are in a perpendicular fall), and furnishes water-power for manufactories. The principal public buildings are the city-hall, the post office, the county court-house and the Danforth Memorial (public library) building. Paterson is preeminently a manufacturing centre. There were, in 1905, 513 factories employing a capital of £5,395,585; and furnishing work for 28,590 employed; and the total factory product was valued at £54,673,083. The city is the centre of silk manufacturing. In 1905 it contained 150 silk-mills, and the products were valued at £25,432,245. There were also, in 1905, 27 dyeing and finishing establishments, with products valued at £5,609,295; 39 foundries and machine shops, with products valued at £2,317,185; 3 wholesale slaughtering and packing houses, with products valued at £2,206,698; and 3 jute and jute-goods factories, with an output valued at £929,310. Among the machine works are two locomotive shops, with an average capacity of three locomotives per day, and a large steel mill.

Paterson had his origin in an act of the legislature of New Jersey on the 22nd of November 1791, incorporating the Society for Establishing Useful Manufactures, the plan for this society being drawn up by Alexander Hamilton. As the most suitable location for its enterprise the society in the following year selected the Great Falls of the Passaic river, and named the place Paterson, in honour of William Paterson (1745-1806), a member of the state Constitutional Convention in 1776, attorney-general of New Jersey in 1776-1783, a delegate to the Continental Congress in 1780-1781, and to the Constitutional Convention of

---

1 This work was attributed to John Law, who borrowed some of his ideas from it. To Law's "system" Paterson was strongly opposed, and it was chiefly due to his influence that it made no way in Scotland.
1787 (where he proposed the famous "New Jersey Plan"), a
United States Senator in 1789-1790, governor of the state in
1790-1793, and an associate justice of the United States Supreme
Court from 1793 until his death. Paterson was incorporated as a
township in 1832, chartered as a city in 1851 and rechartered in
1861. Three great industries—the manufacture of cotton,
machinery and silk—were established in Paterson almost con-
temporaneously with their introduction into the United States.
In 1793 the first cotton yarn was spun at Paterson in a mill run
by ox-power, and in the next year, when the dams and reservoir
were completed, Paterson's first cotton factory began its opera-
tions. After 1840 the manufacture of machinery and of silk
gradually supplanted that of cotton goods. Although an attempt
was made to manufacture machinery in Paterson as early as 1800,
there was little progress until after 1825. The building of the
"Sandusky," Paterson's first locomotive, in 1837, marked the
beginning of a new industry, and before 1860 the city was
supplying locomotives to all parts of the United States and
to Mexico and South America. By 1840 the silk industry had
obtained a footing, and after this date there was a steady
advance in the quantity and quality of the product. From 1872
to 1881 inclusive Paterson consumed two-thirds of the raw
silk imported into the United States.
See L. R. Trumbull, History of Industrial Paterson (Paterson,
1882).

PATEY, JANET MONACH (1842-1894), English vocalist, was
born in London on the 1st of May 1842, her maiden name being
Whytock. She had a fine alto voice, which developed into a
contralto, and she studied singing under J. Wass, Pinsuti and
Mrs Sims Reeves. Miss Whytock's first appearance, as a child,
was made at Birmingham, and her first regular engagement was
in 1865, in the provinces. From 1866, in which year she sang
at the Worcester festival, and married John Patey, a bass singer,
she was recognized as one of the leading contraltos; and on the
retirement of Mme Sainton-Dolby in 1870 Mme Patey was
without a rival whether in oratorio or in ballad music. She
toured in America in 1871, sang in Paris in 1875, and in
Australia in 1890. She died at Sheffield on the 28th of
February 1894.

PATHAN, the name applied throughout India to the Afghans,
especially to those permanently settled in the country and to
those in the northwest of Persia. It is apparently derived from
the Afghan name for their own language, Pushtu or Pukhtu,
and may be traced back to the Pakties of Herodotus. In 1901
the total number of Pathans in all India was nearly 3½ millions,
but the speakers of Pushtu numbered less than 1½ millions.
The name is frequently, but incorrectly, applied to the Mahommedan
dynasties that preceded the Moguls at Delhi, and also to the
style of architecture employed by them; but of these dynasties
only the Lodis were Afghans.

The Pathans of the Indian borderland inhabit the mountainous
country on the Punjab frontier, stretching northwards from a
line drawn roughly across the southern border of the Dera Ismail
Khan district. South of this line are the Baluchis. The Pathans
include all the strongest and most warlike tribes of the North-
west frontier of India, such as the Afridis, Orakzais, Waziris,
Mohmands, Swatis and many other clans. Those in the settled
districts of the North-West Frontier Province (in 1901) numbered
883,779, or more than two-fifths of the population. Each of the
principal divisions is dealt with separately in this work under its
proper head. The Pathans are divided into different sections and
tribes into clans, and each clan into sections, so that the nonen-
closure is often very puzzling. The tribe, clan and section are
alike distinguished by patronymics formed from the name of the
common ancestor by the addition of the word zai or kel; zai
being a corruption of the Pushtu word zee, meaning son, while
kel is an Arabic word meaning an association or company.
Both terms are used indifferently for both the larger and smaller
divisions. Pathans enlist largely in the native army of India;
and since the frontier risings of 1897 they have been formed
with increasing frequency into class-regiments and regiments of
native militia. They make excellent soldiers. The greater part

of the Pathan country was placed under British political control
by the Durand agreement made with the Amir of Afghanistan in
1895.

PATHOLOGY (from Gr. πάθος, suffering), the science dealing
with the theory or causation of disease. The term by itself is
usually applied to animal or human pathology, rather than to
vegetable pathology or Phytopathology (see PLANTS: Pathology).
The outstanding feature in the history of pathology during the
19th century, and more particularly of the latter half of it, was
the completion of its rescue from the thraldom of abstract
philosophy, and its elevation to the dignity of one of the natural
sciences. Our forefathers, if one may venture to criticize them,
were too impatient. Influenced by the prevailing philosophy
of the day, they interpreted the phenomena of disease through
its lights, and endeavoured from time to time to reduce the study
of pathology to philosophical order when the very elements
of philosophical order were wanting. The pathology of the
present day is more modest; it is content to labour and to wait.
Whatever its faults may be—and it is for our successors to judge
of these—there is this to be said in its favour: that it is in nowise
dogmatic. The eloquence of facts appeals to the scientific mind
nowadays much more than the assertion of crude and unproved
principles. The complexity and mystery of action inherent
in living matter have probably been responsible for much of the
vague philosophy of disease in the past, and have furnished
one reason at least why pathology has been so long in asserting
its independence as a science. This, indeed, holds good of the
study of biology in general. There are other factors, however,
which have kept pathology in the background. Its existence
as a science could never have been recognized so long as the
subjects of physics, chemistry and biology, in the widest accepta-
tion of the term, remained unevolved. Pathology, in fact, is
the child of this ancestry; it begins where they end.

Progress in the study of pathology has been greatly facilitated
by the introduction of improved methods of technique. The
fatality with which tissues can now be fixed in the
state they were in when living, and the delicacy
with which they can be stained differentially, have
been the means of opening up a new world of exploration.
Experimental pathology has benefited by the use of antiseptic
surgery in operations upon animals, and by the adoption of
everyday methods of inoculating; while the employment of solid
and culture media in bacteriology—the product of Koch's fertile
and—has been responsible for a great part of the extraordinary
development which has taken place in this department of
pathological research. The discoveries made in pathological bacteri-
ology, indeed, must be held to be among the most brilliant of
the age. Inaugurated by Pasteur's early work, progress in this
subject was first marked by the discovery of the parasite of anthrax
and of those organisms productive of fowl-cholera and
septic disease. Then followed Koch's great revelation in 1882
of the bacillus of tuberculosis (fig. 22, PI. II.), succeeded by the isolation
of the organisms of typhoid, cholera, diphtheria, actinomycosis,
tetanus, &c. The knowledge we now possess of the causes of immunity from contagious disease has resulted from this study
of pathological bacteriology: momentous practical issues have also
followed upon this study. Amongst these may be mentioned
the neutralizing of the toxins in cases of diphtheria, tetanus
and poisonous snake-bites; "serum therapeutics," and treatment
by "vaccines." By means of "vaccination" we are enabled to
induce an active immunity against infection by certain patho-
genic bacteria. The value of such protective inoculations is
manifested in the treatment against small-pox ( Jenner),
cholera, plague (Haffkine) and typhoid (Wright and Semple).
Pasteur's inoculation against hydrophobia is on the same
principle. "Vaccines" are also used as a method of treatment
during the progress of the disease. Sir A. Wright and others,
in recent work on opsonins, have shown that, by injecting dead
cultures of the causal agent into subjects infected with the
organism, there is produced in the body fluids a substance
(opsonin) which apparently in favourable conditions unites with
the living causal bacteria and so sensitizes them that they are
PATHOLOGY

readily taken up and destroyed by the phagocytic cells of tissues. Before the discovery of the bacillus of tubercle, scrofula and tuberculosis were regarded as distinct diseases, and it was supposed that the scrofulous constitution could be distinguished from the tubercular. It was always felt, however, that there was a close bond of relationship between them. The fact that the tubercle bacillus is to be found in the lesions of both has set at rest any misgiving on the subject, and put beyond dispute the fact that so-called scrofulous affections are simply local manifestations of tuberculosis. A knowledge of the bacteriology of scrofulous affections of bone and joints, such as caries and gelatinous degeneration, has shown that they also are tuberculosis diseases—that is to say, diseases due to the presence locally of the tubercle bacillus. At a very early period it was held by Virchow that the large cheesy masses found in tuberculosis of the lung are to be regarded as pneumonic infiltrations of the air-velocities. Their pneumatic nature has been amply substantiated in later times; they are now regarded simply as evidence of pneumonic reaction to the stimulus of the tubercle bacillus. The caseous necrosis of the implicated mass of lung tissue, and indeed of tubercles generally, is held to be, for the most part, the result of the necrotic influence of the secretions from the bacillus. Tubercular pneumonia may thus be looked upon as comparable to pneumonia excited by any other specific agent.

In the "seventies" of the 19th century feeling ran somewhat high over the rival doctrines concerning the origin of pus-corpuscles, Cohnheim and his school maintaining that they were derived exclusively from the blood, that they were leucocytes which had emigrated through the walls of the vessels and escaped into the surrounding tissue-spaces, while Stricker and his followers, although not denying their origin in part from the blood, traced them, in considerable proportion, to the fixed elements, such as fibrous tissues and endothelia. Our present-day knowledge prompts the adoption of a middle course between the two theories.

The cells found in an infamed part are undoubtedly drawn from both sources, but while the blood leucocytes have a great tendency to become fatty and to die, those derived from the fixed tissues incline more to organization; the latter are, in fact, the source of the cicatrix which follows upon the cessation of suppuration (fig. 23, Pl. II. and figs. 31 and 32, Pl. III.). Organization and healing have been keenly inquired into, with results which seem to point the lesson that all methods of healing are to be regarded as extensions of the natural phenomena of growth. Normal cytology, of late, has become a science of itself, and has had a direct bearing upon that which is pathological.

At no time has so much been done to advance our knowledge of diseases of the nervous system as during the last thirty years of the 19th century. The localization of function in the cerebral and in the cerebellar cortex has doubtless been the main cause of this progress, and has proceeded pari passu with an extended insight into the structure and connexions of the parts concerned. The pathology of aphasia, as worked out by a combination of the experimental, the pathological and the anatomical lines of inquiry is a favorable example of such researches. The nervous system, it seems, has a certain number of functions, which are confined to certain parts of the organ, and their disorganization is attended by signs and symptoms which are due to the absence of such functions. Events of this kind, however, are somewhat rare, and we are naturally led to the conclusion that the physiological structure of the human body is so complex and varied, that events resulting from injury of a pathological basis would be unworthy of consideration.

Yet it may well be asked whether this is the final goal to be aimed at. Our starting-point in this, as in all departments of biological study, must be the biological unit, and it is to the alterations to which this is subject, under varying conditions of nutrition and stimulation, that the science of pathology must apply itself. Man can never be the only object of appeal in this inquiry. The human organism is far too complex to enable us to understand the true significance of diseased processes. Our range must embrace a much wider area—must comprise, in fact, all living matter—if we are ever to arrive at a scientific conception of what disease really means. Hence not only must the study of our subject include the diseases peculiar to man and the higher animals, but those of the lowest forms of animal life, and of plant life, must be held equally worthy of attention. Modern research seems to show that living protoplasm, wherever it exists, is subject to certain laws and manifests itself by certain phenomena, and that there is no hard and fast line between what prevails in the two

the fatty marrow is rapidly replaced by cellular elements; this is mainly an active proliferation of the nucleated red cells, and gives rise to the erythroblastic type of marrow. If the white cells be required, as in local suppuring abscess, general septicemia, and other forms of inflammation, an asynchrony will occur among the myelocytes to form the polymorpho-nuclear leucocytes, so that we have in this condition a leukoblastic transformation of the fatty marrow.

A knowledge of the cytology of bone marrow, with the technique of blood examination, is of great assistance in the diagnosis of different pathological conditions. The deleterious influence of high blood-pressure has engaged the attention of physicians and pathologists in several ways, and the conclusion arrived at is, that although it may arise from accidental causes, such as malcomposition of the blood, yet that in many instances it is a hereditary or family defect, and is bound up with the tendency to gout and cirsioptic degeneration of the kidney. The pathology of intra-cardiac and vascular aneurysms has also been inquired into experimentally, and the general impression being that these abnormal sounds result, in most cases at least, from the production of a sonorous liquid vein. Pneumonia of the croupous type has been proved to be, as a rule, a germ disease, the source of the germ varying according to circumstances. The structural changes occurring in the bronchi in catarhal bronchitis have also been ascertained, and, as in the case of pneumonia, have been shown to be frequently excited by the presence of a microphye. The proof of this is not only that the history of such a pneumonia always includes that of a previous cold or cough, but that the changes of the past. Quite irrespective of the nature of the anatomical lesion, the finding of the diphtheria bacillus on the part affected, and the inoculability of this upon a suitable fresh soil are the sole marks by which the malady is to be recognized.

The part played by the thyroid body in the internal economy of the organism has also received much attention. The gland evidently excretes, or at any rate gets rid of, a certain waste product which is highly important, and which, in some way, affects the tissues and to excite certain nervous and tissue phenomena. It wastes in the disease known as "myxoedema," and the above product gathers in the tissues, in that disease, to such an extent that it is necessary to speak of "myxoedema" as a disease. It is questionable if the substance in question is mucoid. The pituitary body probably subserves a like purpose. When the pancreas is excited in an animal, or when it is destroyed in man by disease, the liver secretes a fermente, which, being absorbed into the portal circulation, breaks up a certain portion at least of the grape-sugar contained in the portal blood, and so prevents this overflowing into the circulation in general. The transplantation of a piece of living pancreas into the tissues of an animal, thus rendered artificially diabetic, is said to restore it to health.

Pathological chemistry has been remarkable chiefly for the knowledge we have obtained of the nature of bacterial poisons. Certain of these are alkaloids, others appear to be alburnios. The publication of Ehrlich's chemical, or rather physical, theory of immunity has thrown much light upon this very intricate and obscure subject.

Pathology is the science of disease in all its manifestations, whether structural or functional, progressive or regressive. In times past it has been the habit to look upon its sphere as lying really within that of practical medicine, and human medicine more particularly; as something connected with Biology, tagged on to the treatment of human disease, but unworthy of being studied for its own sake as a branch of knowledge. Such a view can recommend itself to only the narrowest of minds. A bearing, and of course an essential bearing on the study of medicine, it has to do with the properties of disease, the principles of its origin, nature, and propagation of neoplasms of all kinds, especially those which are malignant, are engaging much attention. Much light has been thrown upon the functions and diseases of the blood-forming tissues. The origin of the corpuscles, previously a matter of so much difference of opinion, is now pretty fairly set at rest, and has proved the key to the interpretation of the pathology of many diseases of the blood, such as the different forms of anaemia, of leucocytæmia, &c.

It is largely to researches on the bone marrow that we owe our present knowledge of the origin and the classification of the different cellular elements of the blood, both erythrocytes or red corpuscles, and the series of granular leucocytes. Whatever be the ancestral cell from which these cells spring, it is in the bone marrow that we find a differentiation into the various marrow cells from which are developed the mature corpuscles that pass from the marrow into the blood circulation. The healthy bone marrow reacts with remarkable rapidity to the demand for more blood cells which may be required by the organism; its reactions and variations in disease are very striking. If the demand be for the red cells owing to loss from haemorrhage or any of the anaemias,
kingships. So it is with the diseased conditions to which it is a prey: there is a wonderful community of design, if the term may be used in such a sense, between the diseases of animals and plants, which becomes singularly striking and instructive the more they are inquired into. Utilitarian, or perhaps rather practical, considerations have very little to do with the subject from a scientific point of view—no more so than the science of chemistry has to do with the art of the manufacturing chemist. The practical bearings of a science, it will be granted, are simply, as it were, the summation of its facts, with the legitimate conclusions from them, the natural application of the data ascertained, and have not necessarily any direct relationship to its pursuit. It is when studied on these lines that pathology finds its proper place as a department of biology. Disease as an entity—as something to which all living matter is subject—is what the pathologist has to recognize and to investigate, and the practical application of the knowledge thus acquired follows as a natural consequence.

Since pathology is the science of disease, we are met at the very threshold by the question: What is disease? This may best be answered by defining what we understand by health. What do we mean when we talk of a healthy organism? Our ideas upon the subject are purely arbitrary, and depend upon our everyday experience. Health is simply that condition of structure and function which, on examination of a sufficient number of examples, we find to be commonest. The term, in fact, has the same significance as "the normal." Disease we may define, accordingly, as any departure from the normal standard of structure or function of a tissue or organ. If, for instance, we find that instead of the natural number of Malpighian bodies in the kidney there are only half that number, then we are entitled to say that this defect represents disease of structure; and if we find that the organ is excreting a new substance, such as albumen, we can affirm logically that its function is abnormal. Once granted the above definition of disease, and even the most trivial aberrations from the normal must be regarded as diseased conditions, quite irrespective of whether, when structural, they interfere with the function of the part or not. Thus an abortive supernumerary finger may not cause much, if any, inconvenience to the possessor, but nevertheless it must be regarded as a type of disease, which, trivial as it may appear, has a profound meaning in phylogeny and ontogeny.

Classification.—From the foregoing it will be gathered that the problems in pathology are many-sided and require to be attacked from all points of vantage; and the subject falls naturally into certain great divisions, the chief of which are the following:

I. Morbid anatomy.

(a) Naked-eye or macroscopic.

(b) Morbid histology or microscopic.

II. Pathological physiology.

III. Pathogenesis.

IV. Aetiology.

V. Pathological chemistry.

The term "pathogenesis" has reference to the generation and development of disease, and that of "aetiology," in its present bearing, has to do with its causes. The use of the term "pathological physiology" may at first appear strange, for if we define physiology as the sum of the normal functions of the body or organism, it may be hard to see how there can be a physiology which is pathological. The difficulty, however, is more apparent than real, and in this sense, that if we start with a diseased organ as our subject of inquiry, we can quite properly, and without committing a solecism, treat of the functions of that organ in terms of its diseased state.

Influences Working for Evil upon the Organism

1. Malnutrition.—When the blood supply is entirely cut off from a tissue the tissue dies, and in the act of dying, or afterwards, it suffers certain alterations dependent upon its surroundings. Thus, when the circulation to an external part is obstructed completely, as in the case of a limb where the main artery has been occluded and where the anastomotic communications have not sufficed to continue the supply of blood, the part becomes gangrenous (fig. 24, Pl. II.); that is to say, it dies and falls prey to the organisms which excite putrefaction, just as would happen to any other dead animal tissue were it uncirculated with the body. Fermentative changes are set up in it, characterized by the evolution of gas and the formation of products of suboxidation, some of which, being volatile, account for the characteristic odour. In the formation of these the tissues break down, and in course of time lose their characteristic histological features. The blood suffers first; its pigment is dissolved out and soaks into the surroundings, imparting to them the pink hue so diagnostic of commencing gangrene. Muscle and white fibrous tissue follow next in order, while elastic tissue and bone are the last to show signs of disintegration. The oil separates from the fat-cells and is found lying free, while the sulphurated hydrogen evolved as one of the products of putrefaction reacts upon the iron of the blood and throws down a precipitate of sulphide of iron, which in course of time imparts to the limb a range of colour commencing in green and terminating in black.

The temperature at which the limb is kept, no doubt, favours and hastens the natural process of destruction, so that putrefaction shows itself sooner than would be the case with a dead tissue removed from the body and kept at a lower temperature. Nevertheless, gangrene is nothing more or less than the putrefactive fermentation of an animal tissue still attached to the body. If the amount of liquid contained in the tissue be small in quantity the part mummifies, giving rise to what is known as "dry gangrene." If the dead part be protected from the ingress of putrific organisms, however, it separates from that which is living without the ordinary evidences of gangrene, and is then known as an "aseptic slough." Should the portion of tissue deprived of its circulation be contained in an internal organ, as is so often the case where the obstruction in the artery is due to embolism, it becomes converted into what is known as an "infarction." These infarcts are most common in organs provided with a terminal circulation, such as prevail in the kidney and spleen. The terminal branches of the arteries supplying these organs are usually described as not anastomosing but many, if not all, of Cohnheim's end-arteries have minute collateral channels; which, however, are usually insufficient to completely compensate for the blocking that may occur in these arteries, therefore, when one of them is obstructed, the area irrigated by it dies from malnutrition. Being protected from the ravages of the organisms which induce putrefaction, however, it does not become gangrenous; it is only where the obstructing agent contains these organisms that a gangrenous slough follows, or, in the case of the contaminating organisms being of a supplicative variety, ends in the formation of a so-called "pyamic abscess," followed by rapid dissolution of the dead tissue (fig. 24, Pl. II.). In ordinary circumstances, where the artery is obstructed by an agent free from such organisinal contamination, the part becomes first red. This is due to intense engorgement of vessels brought about through these minute existing collateral channels and results in a peripheral congested zone round the infarct. There may be haemorrhage from these vessels into the tissues. This collateral supply not being sufficient to keep up the proper flow of blood through the part the veins tend to become thrombosed, thus increasing the engagement. The central part of the obstructed area very soon undergoes degenerative changes, and rapidly becomes decolorised. This necrosed area forms the pale infarct. Absorption of this infarcted zone is carried on by means of leucocytes and other phagocytic cells, and by new blood-vessels. If absorption be not complete the mass undergoes caseation and becomes surrounded by a capsule of fibrous tissue—being sharply cut off from the healthy tissue.

Where the malnutrition is the effect of poorness in the quality of the blood, the results are of course more widespread. The muscles suffer at an early period: they fall off in bulk, and later suffer from fatty degeneration, the heart being probably the first muscle to give way. Indeed, all tissues when under-nourished.
PATHOLOGY

either locally as the result of an ischaemia, or generally as from some impairment of the blood, such as that prevailing in pernicious anaemia, tend to suffer from fatty degeneration; and at first sight it seems somewhat remarkable that under-nourished tissues should develop fat in their substance (figs. 26 and 27, Pl. II.). The fatty matter, however, it must be borne in mind, is the expression of dissimilation of the actual substance of the protoids of the tissues, not of the splitting up of protoids or other carbonaceous nourishment supplied to them.

A part deprived of its natural nerve-supply sooner or later suffers from the effects of malnutrition. When the trigeminal nerve is divided (Majendie), or when its root is compressed injuriously, say by a tubercular tumour, the cornea begins to show points of nerve-supply, increases its transparency, and even total disintegration of the eyeball. The earliest interpretation put upon this experiment was that the trophic influence of the nerve having been withdrawn, the tissue failed to nourish itself, and that death ensued as a consequence. The subsequent experiments of Snellen, Senftleben, and, more lately, of Turner, seem to show that if the eyeball be protected from the impingement of foreign particles, an accident to which it is liable owing to its state of anæsthesia, the ulceration may be warded off indefinitely. If the eyeball be kept perfectly clean and no organism be admitted from the outside then ulceration will not follow. If, on the other hand, any pathogenic organisms be present the results are disastrous beyond all description. The skin of the lids, for instance, is greatly lessened resistance. The bed-sores which follow paralysis of the limbs are often quoted as proof of the direct trophic action of the nerve-supply upon the tissues, yet even here the evidence is somewhat contradictory. Still, if we want a better explanationwe are almost bound to conclude are to be accounted for on the direct nerve-control theory. The common variety of bed-sores is the result of continuous pressure on irritable and tender parts, and the supine position of which are lowered by a lesion of the cord cutting off the trophic supply to the skin affected. The acute bed-sores is, in some cases, a true trophic lesion occurring, as it may, on parts not subjected to continuous pressure. The trophic influence of the skin may be so great that a slight degree of external pressure or irritation is sufficient to excite even a gangrenous inflammation. Again, a fractured bone in a paralysed limb often fails to unite, while a bone in a limb which is in good condition readily undergoes a surcharged surface on a paralysed limb shows little healing reaction. A salivary gland degenerates when its nerve-supply is cut off; and the nerves leading up to the symmetrical sloughs in Raymond's disease have been found in an advanced state of degeneration (Affleck and Wiglesworth). It is just a question, however, whether, even in instances such as these, the nutritional failure may not be explained upon the assumption of withdrawal of the local vasomotor control, and be liable to failure, whether or not there be any one of the chief functions of the nerve cell is that of the propagation of a trophic influence along its axon. When a nerve-trunk is separated from its central connexions, the distal portion falls into a condition of great irritability (Waller), the axon degenerates, and is found to be an empty tube. That special trophic nerves, however, exist throughout the body, seems to be a myth. It is much more likely, as Verworn alleges, that the nerves which influence the characteristic function of any tissue regulate it in such a manner that they alone contain the necessary potent. It may be observed that every nerve serves as a trophic nerve for the tissues it supplies. It is a significant fact that neoplasms contain very few nerve-fibres, even although growing luxuriantly, and there is a doubt whether the few twigs contained in them may not more properly be dragged into their midst as the tumour mass expanded (Young).

Overwork.—The effect of overwork upon an organ or tissue varies in accordance with (a) the particular organ or tissue concerned, (b) the amount of nourishment conveyed to it, and (c) the power of assimilation possessed by its cells. In the case of muscle, if the available nourishment be sufficient, and if the power of assimilation of the muscle cells remain unimpaired, its bulk increases, that is to say, it becomes hypertrophied. It may be advisable to define exactly what is meant by “hypertrophy,” as the term is often used in a loose and insignificant sense. Mere enlargement of an organ does not imply that it is in a state of hypertrophy, for some of the largest organs met with in morbid anatomy are in a condition of extreme atrophy. Some organs are subject to enlargement from deposition within them of a foreign substance (amyloid, fat, &c.). This need not be understood to imply that the organ is hypertrophied. Hypertrophy is used when the individual tissue elements become bigger to meet the demands of greater functional activity: hyperplasia, if there is an increase in the number of these elements; and pseudo-hypertrophy, when the specific tissue element is largely replaced by another tissue.

There are conditions in which we have an abnormal increase in the tissue elements but which strictly should not be defined as hypertrophies, such as new-growths, abnormal enlargements of bones and organs due to syphilis, tuberculosis, osteitis deformans, acromegaly, myxoedema, &c. The enormously long teeth sometimes found in rodents also are not due to hypertrophy, as they are normally endowed with rapid growth to compensate for the constant and rapid attrition which takes place from the opposed teeth. Should one of these teeth be destroyed the opposed one loses its natural means of attrition and becomes a remarkable, curved tusk-like elongation. The nails of the fingers, or the hair of the scalp may grow to an enormous length if not trimmed.

True hypertrophy is commonly found in the hollow muscular organs such as the heart, bladder and alimentary canal. As any obstruction to the outflow of the contents throws an increased amount of work on the walls, in order to overcome the resistance, the intermittent strain, acting on the muscle cells, stimulates them to enlarge and proliferate: fig. 28, Pl. III. The adaptive hypertrophy. Should there be much loss of tissue of an organ, the cells of the remaining part will enlarge and undergo an active proliferation (hyperplasia) so that it may be made up to the original amount. Or again, in the case of paired organs, if one be removed by operation, or destroyed by disease, the other at once undertakes to carry on the functions of both. To do so a general enlargement takes place until it may reach the size and weight equal to the original pair. This is known as compensatory hypertrophy.

Examples of physiological hypertrophy are found in the ovaries, uterus and mammary glands, where there is an increased functional activity required at the period of gestation. Local hypertrophy may be due to stimuli resulting from irritation or intermittent pressure, as one may see in the thickening on the skin of the artisan's hands. The extreme development of the muscles in the weightlifting athlete and in the arm of the blacksmith is the result of increased functional activity with a corresponding increase in the vascular supply; this exercise may produce an over-development so excessive as to be classed as abnormal.

In atrophy we have a series of retrograde processes in organs and tissues, which are usually characterized by a progressive diminution in size which may even end in their complete disappearance (fig. 29, Pl. II.). This wasting may be general or local—continuously from the embryonic period there is this natural process of displacement and decay of tissues going on in the growing organism. The functions of the thymus gland begin to cease after the second year from birth. The gland then slowly shrinks and undergoes absorption. From atrophy of their roots, caused by the pressure of the growing permanent teeth, the "milk teeth" in children become loose and are cast off. The ovaries show atrophic changes after the menopause. In old age there is a natural wearing out of the elements of the various tissues. Their physiological activities gradually fail owing to the constructive processes having become so exhausted from long use that the destructive ones are able to overtake them. As the cell fails and shrinks, so does it become more and more unable to make good the waste due to metabolism. This physiological wasting is termed senile atrophy.

General atrophy or emaciation is brought about by the tissues being entirely or partially deprived of nourishment, as in starvation, or in malignant, tubercular, and other diseases of the alimentary system which interfere with the proper ingestion, digestion or absorption of food material. The toxic actions produced in continued fevers, in chronic diseases, and by intestinal parasites largely aid in producing degeneration, emaciation and atrophy.

Atrophy may follow primary arrest of function—disuse atrophy. The loss of an eye will be followed by atrophy of the optic nerve; the tissues in a stump of an amputated limb show atrophic changes; a paralysed limb from long disuse shows much wasting; and one finds at great depths of the sea fishes and marine animals, which have almost completely lost the organs
of sight, having been cut off for long ages from the stimuli (light) essential for these organs, and so brought into an atrophic condition from disuse.

Atrophy may also follow from overwork. Increased work thrown on to a tissue may produce hypertrophy, but, if this excessive function be kept up, atrophy will follow; even the blacksmith's arm breaks down owing to the hypertrophic muscle fibres becoming markedly atrophied.

From these causes a certain shrinkage is liable to occur, more evident in some parts of the body than in others. Thus the brain falls off in bulk, and the muscles become attenuated, and in no muscle is this more notable than in the case of the heart. A tendency to pigmentation also develops in certain tissues of the body, such as the nerve and muscle cells. As a result of these various degenerations the functions of the body deteriorate, the factors of the body's resistance are diminished, and the muscular energy of the body is below what it was in earlier life, while the secreting glands in certain instances become functionally obsolete.

Continuous Over-pressure.—The tissues of an animal or plant are all under a certain pressure, caused, in the one case, by the expansive action of the heart and the restraint of the skin and other elastic tissues, and, in the other case, by the force of the rising sap and the restraint of the periderm or bark. Under this normal amount of pressure they can live and grow. But whenever, from any cause, the degree of pressure which they are naturally intended to withstand is surpassed, they fail to nourish themselves, become granular, die, and, failing to pieces, are absorbed.

Deterious Surroundings.—There can be little doubt that all unnatural and artificial modes of life tend to deterioration of the powers of resistance of the organism to disease. We see it exemplified in plant life in circumstances which are unnatural to the life of the plant, and the prevalence of certain constitutional tendencies among the inhabitants of crowded cities bears evidence to the same law.

Man, like other animals, was naturally intended to lead an outdoor life. He was originally a hunter and a tiller of the ground, breathing a pure atmosphere, living on a frugal diet, and exercising his muscles. Whenever these conditions are infringed his powers of resistance to disease are lessened, and certain tendencies begin to show themselves, which are generally termed constitutional. Thus the liability to tubercular infection is far commoner in the midst of a depraved population than in one fulfilling the primary laws of nature. Tuberculosis is a disease of cities rather than rural districts, and syphilis is more disastrous and protracted in its course in the deprived than than in the robust. Cattle kept within-doors are in a large proportion of cases tuberculous, while those of the open air are far less likely to be diseased. The improvement which has taken place in the general health of the inhabitants of cities during recent years, concurrent with hygienic legislation, is ample proof of the above assertions. The diminution in the number of cases of tuberculosis in this country in the last forty to fifty years of the 19th century points itself in this direction. Every living organism, animal and vegetable, tends to maintain a normal state of health; it is when the natural laws of health are violated that the liability to disease begins to assert itself. If, in these circumstances, the food supply be also insufficient, the combination of influences is sure, in course of time, to bring about a physical deterioration of the race. Certain avocations have a peculiar influence in causing diseased states of body. Thus workers in lead suffer from the effects of this substance as a poison, those who work in phosphorus are liable to necrosis of bone and fatty degeneration of the blood vessels and organs, and the many occupations in which dust is inhaled (coal-mining, stone-dressing, steel-polishing, &c.; fig. 30, PI. III.) are fraught with the greatest danger, owing to the destructive influence exerted upon the lungs by the inhaled particles. Among the most dangerous of the latter class (the pneumoconioses) is perhaps that in which the dust particles take the form of finely divided freestone, as in stone-dressing and the dry-polishing on the grindstone of steel. The particles in this case set up a form of fibrosis of the lung, which, either by destroying the function of the lung or by prolonging the period of its emptying, is extremely fatal. The abuse of alcohol may also be mentioned here as a factor in the production of disease.

Parasitism.—Of all external agents acting for evil, however, probably vegetable and animal micro-organisms with a pathogenic bent are most to be feared. When we consider that tuberculosis, diphtheria, cholera, tetanus, typhoid fever, anthrax, malaria and a host of other contagious diseases have each been proved to be of parasitical origin, an idea may be conveyed of the range of the subject. The living organism may be regarded as constantly engaged in a warfare with these silent and apparently insignificant messengers of destruction and death, with the result that too often the battle ends in favour of the attacking enemy.

Hereditv.—The tendencies to disease are in great part hereditary. They probably express a variation which may have occurred in a far-back ancestor, or in one more recent, and render the individual vulnerable to the attacks of parasitic fungi, or, it may be, become manifest as errors of metabolism. The psychopathic, the tubercular, the rickety, and the gouty constitution may all be transmitted through a line of descendants, and only require the necessary exciting agents to render them apparent. A distinction must be drawn between the above and diseases, like syphilis and small-pox, in which the contagion of, not the tendency to, the disease is transmitted directly to the foetus in utero. (See Heredity.)

The Cellular Doctrine in Pathology.

The cellular pathology is the pathology of to-day; indeed, protoplasma—its vital characteristics under abnormal influences and its decay—will be regarded most likely as the basis of pathology in all time. According to our present knowledge of physiological and pathological processes, we must regard the cell as the ultimate biological unit—a unit of structure and a unit of function; this was first put forward by Schleiden in 1838, and by Schwann in 1839, but we owe to Virchow the full recognition of the fundamental importance of the living cell in all the processes of life, whether in health or disease. When Virchow wrote, in 1859, "every animal presents itself as a sum of vital unities, every one of which manifests all the characteristics of life," he expressed a doctrine whose sway since then has practically been uninterrupted. The somatic cells represent communities or republics, as it were, which we name organs and tissues, but each cell possesses a certain autonomy and independence of action, and exhibits phenomena which are indicative of vitality.

Still, it must be borne in mind that this alleged autonomy of action is said to be founded upon an erroneous supposition, on the supposition that each cell is structurally, and it may be said functionally, separated from those in its neighbourhood. It is well known that in the vegetable kingdom the protoplasma of one cell frequently overflows into that of cells adjacent—that there is, as it were, a continuous network of protoplasma (idio-plasm of Nägeli) prevailing throughout vegetable tissues, rather than an aggregation of isolated units. The same inter-communication prevails between adjacent cells in some animal tissues, and more particularly in those which are pathological, as in the case of the epithelial cells of cancer. Assuming, with Sedgwick and others, this amassed and bound condition of the tissues to be true, it would be necessary to reject the cell-doctrine in pathology altogether, and to regard the living basis of the organism as a continuous substance which is the centre of cell activity; Structure of Pathological Cells.

DESCRIPTION OF PLATE I.

Series of Figures Illustrative of Irregular Division of Cells. Figs. 1 to 6 are from the epithelial cells of a cancer of the mamma. (After Galeotti.) ... 7 to 21 are from a sarcoma. (After Trambari.) Fig. 1.—Resting epithelial cell.
PATHOLOGY

varies in shape, but is usually round or oval, and is sharply defined by a nuclear membrane from the cytoplasm in which it lies. The nucleus in its vegetative stage shows a fine network throughout containing in the meshes the so-called nuclear-sap; attached to the network are the chromosomes, in the form of small irregular masses, which have an affinity for the "basic dyes." Embedded in the nucleus are one or more nucleoli (plasmosomes) having an affinity for the "acid dyes." The nucleus shows an unstable point at the centre known as the endonucleus or nucleolus (Auerbach).

The cell body, or cytoplasm, is apparently composed of a fine reticulum or network, containing within the meshes a softviscid, transparent substance, the cell-sap, or hyaloplasm, which is probably a nutrient sap. The chromosomes, in the form of the nuclear plate, are found manifestations of functional activity, in the form of digestive vacuoles, granules, fat, glycogen, pigment, and foreign bodies. Usually the cytoplasm shows a marked affinity for the acid stains, but those contained in which the cell may show great variation in their staining reactions.

The centrosomes which play so important a part in cell division may be found either lying within or at one side of the nucleus in the vegetative condition of the cell. Centrosomes may be single, but usually two are lying close together in the attraction-sphere. When mitosis is about to take place, they separate from one another and pass to the poles of the nucleus, forming the achromatic spindle. After the division and cleavage of the chromosomes of the original nucleus has taken place, these pass from the equator to the equator of the spindle, rearranging themselves close to the separated centrosomes to form daughter nuclei.

The cytoplasm of the cell now undergoes division in a line between the two centrosomes, the complete separation having taken place, we have two daughter cells formed from the original, each being a perfect cell-unit. Some pathological cells, such as the giant-cells of tumours, of bone, and those of tubercle, are polynucleated; in some of these the nuclei may contain as many as thirty or more nuclei.

The only evidence we have in pathology of living structures in which apparently a differentiation into cell-body and nucleus does not exist, is in the case of bacteria, but then there comes the question whether they may not possess a chromatin distributed through their substance, in the form of metachromatic points, as is the case in some infusoria (Trachelocerca, Gruber).

Although the methods of cell-division prevailing in normal structures are essentially the same, as in the development of the more complicated structures, yet certain modifications of these methods are more noticeable in the latter than in the former. Thus in the neoplasma direct cell-division is more the rule than in healthy parts. In actively growing neoplasms, the division method prevails largely, because they do not go on side by side with the direct cell division. A curious and interesting modification of the indirect method, known as "asymmetrical division," occurs frequently in epitheliomata, sarcomata, &c. (Hansemann). It consists in an unequal distribution of the chromosomes, so that one may become hypochromic, the other hyperchromatic, when this happens the resulting cleavage of the cytoplasm and nucleus is also unequal. Several explanations have been given of the meaning of these irregularly chromatic cells, but that which most lends itself to the facts of the case seems to be that they represent a condition of abnormal karyorhexis.

In many pathological cells undergoing indirect segmentation, certain nuclei are larger than any of the daughter nuclei themselves at the poles of the achromatic spindle. When they are present, that at one end of the spindle may be unusually large, the other of natural size, and they may vary in shape. In pathological cell-division it happens occasionally that the segmentation of the cytoplasm is delayed beyond that of the mitotic network. The daughter nuclei may have arrived at the anaphase stage, and have even gone the length of forming a nuclear membrane, without an equatorial depression having shown itself in the cell-body. Sometimes this equatorial depression fails entirely, and the separation, as in some vegetable cells, takes place through the construction of a cell-plate. Intranuclear plexuses are not usually found in giant-cells, but have been described in the giant-cells of sarcomata by Klebs and Hansemann, and in those of tubercle by Baumgarten.

Some of the nuclei within multinucleated cells may occasionally be engaged in mitotic division, the others being in the resting state.

In the earlier accepted notion of direct segmentation, usually known as the scheme of Remak, division was described as commencing in the nucleus, as thereafter spreading to the cell, and ultimately implicating the cell-substance. Trumbull, however, finds confirmatory evidence of this in the division of cells in Remak's scheme. Considered, however, he has never found that the attraction-spheres play an important part in direct cell-division, or, indeed, that they exert any influence whatever upon the mechanism of the process. Where pignment was present, it was found that the attraction-spheres were represented by quite unpigmented areas, sometimes with a centrosome in their midst.

REPAIR OF INJURIES

In the process of inflammation we have a series of reactions on the part of the tissues, and fluids of the body, to counteract the ill effects of irritation or injury, to get rid of the cause, and to repair its results. Injury and loss of tissue are usually followed by repair and in both the constructive and reparative changes are, as a rule, classified under the term inflammation. The irritants may be bacteria and their toxins, or they may be mechanical, chemical or thermal.

We do not now concur with the old view that inflammation was essentially an injurious process; rather do we look upon it as beneficial to the organism. In the various reactions of the tissues against the exciting cause of the injury we see a striking example of a beautifully organized plan of attack and defence on the part of the organism.

In some of the infective conditions the conflict fortifies the organism against future attacks of the same nature, as for example in the immunity following many of the acute infective diseases. This acquired immunity is brought about by the development of a protective body as a result of the struggle of the cells and fluids of the body with the invading bacteria and their toxins.

This resistance may be more or less permanent. If the invasion is due to a pus-producing micro-organism which settles in some local part of the body, the result is an abscess (fig. 25, Pl. II).

ABSCESSES.—One can easily demonstrate all the actions and reactions which take place in this form of acute inflammation. In such a condition the skin shows a seedy layer of these minute but dangerous sores in the tissues. At once they proceed to make good their hold on the position they have secured by secreting and throwing out toxins which cause more or less injury to the tissues in their neighborhood. As the abscess (or sarcoma) the attraction-spheres in the tissues everything favourable for their needs, rapidly multiply and very soon produce serious results. At this point one's attention is focused on the wonderful reactions possessed by the healthy tissues in combatting the inflammation.

In a very short period—within three or four hours after infection—there appears to have been a message conveyed to the defenders of the body both as to the point of attack and the nature of the invasion. Certain substances as citric acid, are known to be a part of the various reactions of the tissues—the vascular inflammatory changes—which is the first move to neutralize the malignt effects. We find at this early stage oedema of the part. This is an increased exudation of fluid from the engorged blood vessels which not only dilutes the toxins, but is supposed to contain substances which in some way act on the living micro-organisms and render them a more easy prey to the polymorpho-nuclear leucocytes (fig. 23, Pl. II)—cells that are motile and extremely phagocytic to these bacteria. At this stage the

Drawn by R. Muir.
Rapidity of the blood circulation has become greatly diminished. 

The polymorpho-nuclear leucocytes are seen in great numbers in the blood vessels.

If the cells, belonging to our first army of defenders, are found continually circulating in the blood stream in fearful numbers; they are ever ready to rush to the point of attack, where they at once leave the blood stream by passing through the vessel walls and immigrating into the tissues of the danger zone. There they should be found, and taking hold of their interior and destroying the micro-organisms in large numbers. At the same time large numbers of these cells perish in the struggle, but even the death of these cells is of value to the body, as in the process of breaking down there are set free from them not only act demetrially to the bacteria, but also may stimulate bringing forward of another form of cell defenders—the mononuclear leucocytes.

To replace this cellular destruction there has been a demand for reinforcements on the home centres of the polymorpho-nuclear leucocytes—the bone marrow. This call is immediately answered by an active proliferation and steady maturing of the myelocytes in the marrow bone form mono-nuclear leucocytes. These then pass into the blood stream in very large numbers, and take the place of the early leucocytes, and thus to be specially attracted to the point of injury by a positive chemiotactic action. This phenomenon has been termed called chemotaxis, and has been studied by several investigators. In a series of experiments with several chemical compounds it was found that reaction effect had been produced by using fine glass tubes filled with a solution of a chemical substance, and that these olphages were attracted—positive chemotaxis—by the various components of the serum—turbent, and other substances. That quinine, chloroform, glycine, alcohol, with others, had no attractive influence on them—negative chemotaxis—was also found. A weak solution may have a marked positive attraction, whilst a strong solution of the same substance will have the opposite effect. It has been proved that the pyogenic bacterial toxins, if not too concentrated, will attract the polynuclear leucocytes, but if concentrated may have a repelling influence.

Then we have the property of adaptation, in which the negative reaction may be changed into a positive; a given toxin may at first repel, but when the gradual process the cell becomes accustomed to such a toxin, and will at move towards it.

On reaching the vicinity they leave the blood stream and join in the warfare—many performing their function of phagocytes of pus, others carrying the toxins. The tissues of the body become disorganized, and the body is taken—by the mass of warring cellular elements now recognized as pus.

As soon as the fluids and the polymorpho-nuclear leucocytes have successively diminished the virulence of the micro-organism, the second line of defensive the mononuclear leucocytes (fig. 23, pl. II.) make their appearance at the field of battle in ever increasing numbers. These are amoeboid cells and are extremely phagocytic, the processes of digestion being greatly developed. Their principal function is to bring about the uniformity, and are the assimilating material. They take them up into their protoplasm, where it is rapidly digested by being acted on by some intracellular digestive ferment. (fig. 31, pl. II.) Where the material is too large to be taken up by the cell, they are broken down by acid, which is brought to the cells surrounding the material, to which they closely apply themselves, and by the secretion of the ferment, a gradual process of erosion is brought about with ultimate absorption.

If the wounded area is not able to open on to a free surface so allowing the contents to be drained off, the phagocytic cells play a very prominent part in the resolution of the abscess. They are seen pushing their way right into the field of conflict, and greedily ingesting both friends and foes. These, the mononuclear leucocytes, have performed their functions, are of no more use to the organism and are therefore replaced by the mononuclear phagocytes as useless material (fig. 31, pl. III.).

The tissues having now mobilized an army that completely surrounds the fighting zone, there is a gradual and general advance made from all sides. The vanguard of this advancing army is composed of the monocellular phagocytes of the polymorpho-nuclear leucocytes (polysbats) accompanied by numerous fibrin fibrils.

These phagocytic cells carry out the complete removal of all the injured warring elements and the damaged tissues of the part. The vessels which they meet along their route are brought forward the food supply that is needed by the advancing army, and advance consequently to carry on its function; they probably also drain off the deleterious fluid substances formed by the cellular disintegration that goes on during this process. On the advance of this army of phagocytes or scavenger cells follow the third line of defenders, the connective tissue cells or fibroblasts.

All these cells are probably of local origin and are now stimulated to activity by the injured zone. They then develop a large fibrous tissue which differentiates into fibrous laminae forming a

zone which shuts off the abscess from the healthy tissue and so prevents the further invasion and injurious effects of the micro-organism. By the aid of the new fibroblasts this fibrous tissue zone gradually encroaches on the pus area and replaces the phagocytic layer of cells as they proceed with the absorption of the pus layer. Once the complete removal of the pus mass has been accomplished by the new tissue formation, the damaged area is replaced by the new fibrous tissue, which later becomes condensed and forms the cicatricial or scar tissue (fig. 35, Pfl.).

WOUNDS.-The healing of wounds is brought about by similar processes to that seen in the evolution of an abscess.

If the injury be a small incised wound through the skin and subcutaneous tissues and no septic contamination, there usually follows a minimum of reaction and for of the injured tissues. As the edges of the wound are brought into accurate apposition there is little or no blood lodged between them, so that an extremely narrow strip of fibrin glued to cut edges together. This strip is rapidly produced, mainly by the adjoining tissue growing across the temporary filled breach and firmly uniting the two cut surfaces. The vascular changes are practically absent in the healing of small wounds.

Healing by second intention, or granulation, is usually seen where there has been loss of tissue, or extensive damage. The reactions of the tissues vary in degrees according to the nature and extent of the injury. In resisting such insults, a remarkable uniformity and regularity is shown by the different cells and fluids of the healthy tissues of the body. Although we have not reached a stage of certainty regarding their origin, some of these, recent investigations have brought forward evidence to elucidate many processes; carried on by the different cells in the various types of the inflammatory process.

If there is a loss of tissue brought about by severe injury to the skin, and the deeper tissues, there is usually an extravasation of blood from the severed vessels, and serum which fills the breach in the tissues and the whole is rapidly transformed into a fibrous mass due to the integration of the polymorpho-nuclear leucocytes setting free their pigment. The fibrin thus set free brings about the coagulation of the serum, which acts as a protective and temporary scaffolding to the damaged tissue. Lying between the fibrin mass and the healthy tissues is a zone of injured and degenerated tissue elements, the result of the trauma.

As early as six hours after the injury the polymorpho-nuclear leucocytes are seen passing in large numbers from the dilated and congested blood vessels of the tissues at the margin of the wound into the fibrous zone with their degenerative substances and fibrin fibrils, which bring about the liquefaction of the fibrin and the damaged tissues histolysis—and thus assist the process of absorption. Then we are presented with the coming of the next series of cells. Their function being at an end to give way to these cells which carry on the process of absorption.

In a period varying from twenty-four hours to thirty hours there is marked evidence of the degenerated cellular elements in the damaged zone by the presence of fibrin fibrils. Numerous fibroblasts, together with polysbats, are visible in the fibrin mass, and the vessels at the periphery of the damaged zone are seen to be developing new roots which assist in the process of absorption. These vascular buds grow out in various directions as little solid projections of cells; they then become channelled and form the new but temporary meshwork.

Two to three days the processes are more clearly emphasized. By these processes we reach the stage where the fibrin mass and damaged tissues have been completely removed, and replaced by a temporary vascular and cellular tissue, known as granulation tissue. (fig. 34, pl. III.) In turn has to give way to the more firm and differentiated fibrous tissue. At this stage the skin epithelium may have grown over the wound.

After five to seven days we find the connective tissue cells taking the final part in the building up of the new permanent tissue, for at this stage there is no longer any process of fibroplasia. The fibroblasts in number and form a delicate supporting network. It is from these cells that the fine fibrilar substance is formed, and from this stage onwards—after seven days—is there a steady increase in the new fibrils, giving more density to the tissue. At first the growth is slow but later it is brought about an alteration in the arrangement of the position of the fibroblasts. These become spindle shaped with their long axis running at right angles to the vessels (fig. 34, pl. III.); they become firmly bound together as their fibrils become more developed they gradually form fibrous laminae which are laid down first in the deeper wound and work their way outwards and form the new permanent meshwork over the intact. When this process has reached a certain stage and all the absorption necessary, the new blood vessels, from the increasing pressure of the successive fibrous layers, gradually unwind and become obliterated, i.e. at a period corresponding to
the condensation of the fibrous laminae and the disappearance of the cellular character of the granulation tissue. Thus is formed in the damaged area a permanent tissue known as scar tissue (fig. 35, Pl. III.).

Another feature, where a chronic inflammatory process has taken possession of an organ, or let us say, has been located in periostium or other fibrous part, there is a great tendency to the production of cicatricial fibrous tissue in mass. Thus it is laid down in large quantity in chronic inflammatory condition, fibrous thickening, and reacts upon these organs by contracting and inducing atrophy. The term "cirrhosis" or "fibrosis" is usually applied to such a condition of organs (figs. 36 and 37, Pl. IV.), that of "sclerosis" is used when such a denudation of fibrous tissue occurs within the central nervous system. Gull and Sutton asserted that in particular states of body, and more especially in the condition associated with cirrhotic kidney, such a fibrosis becomes general, running, as they alleged it does, along the areolata of arteries and spreading on the capillaries. They supposed that it was accompanied by a peculiar hyaline thickening of the arterial wall, usually of the tunica intima, and hence they termed the supposed diseased state "arterio-capillary fibrosis," and supposed that the cirrhotic kidney is simply a local manifestation of a general fibrous disease. Their theory, however, has fallen into disfavour of late years.

**Tumours or New Growths**

The various definitions of the term "new growth" leave us with a definite conception of it as a new formation of tissue which appears to originate and to grow independently. We have already seen that the bodies of the social community, each consisting of an element of which the whole body is composed and subordinates it to the good of the whole organism.

The essential characteristic of a new growth is that this sub-ordination is lost and the tissue elements, freed from the normal mutual restraint of their interdependence, give way to an abnormal growth. All the hypotheses about the causation of new growth seek to explain the secret of this individuality or "autonomy," as they recognize that the mystery of the origin of the great majority of tumours would be solved if we could trace how or why the tissue elements in which they develop first took on this abnormal growth.

Tumours are divided into two main groups—innocent and malignant. These differ only in degree and there is no hard and fast line between them. Innocent tumours are usually sharply defined from the surrounding tissues, and show no tendency to spread into them or to pass by means of lymphatics and blood-vessels to neighbouring parts (fig. 39, Pl. IV.). Malignant tumours, on the other hand, invade the adjacent tissues and pass by lymphatics and blood vessels to distant parts, where they set up secondary growths (fig. 39, Pl. IV.).

Tumours appear to arise spontaneously, i.e., without evident cause; they may develop in association with prolonged irritation or injury (later referred to in more detail). To heredity, as an indirect or predisposing cause, has probably been assigned too great importance, and the many facts brought forward of the relative frequency of cancer in members of one family only justifiy the conclusion that the tissue-resistance of certain families is lowered.

At the present time we have still before us the question, what is the essential cause of tumours (q.v.)? This, one of the most difficult problems of the living, is being attacked by many able workers, who are all striving from different standpoints to elucidate the nature of these new formations, which spring from the normal tissues in which they develop and which they destroy. In spite of all the valuable research work that has been done within the last few years, the essential cause of new growths still remains unknown.

To the work carried on by the Imperial Cancer Research Fund in England, and to investigators in other countries, are due the present day knowledge of some of the more obscure facts. In connexion with the study of the causes of cancer growths and the transplantation of such growths into a new host of the same species (mice and rats), we have gathered much new knowledge.

Many of the hypotheses of the past put forward to explain cancer must be discarded, in view of the facts brought to light by the comparative and experimental research of recent times. According to the hypothesis of Waldeyer and Thieme there is perfect equilibrium between the normal epithelium and its supporting structure, the connective tissue, but with advancing age this balance is upset owing to the connective tissue gradually losing its restraining power. The epithelial cells are then able to pass from their normal position, in consequence of which they proliferate and at the same time revert to a more primitive type of cell. In this way they give rise to malignant new growths.

Cohnheim's hypothesis of "embryonic residues" provides that early in the development of the embryo some of the cells, or groups of cells, are separated from their organic continuity during the period of condensation, and that in health amongst which they lie dormant with their inherent power of proliferation in abeyance. At a later date in the life of the individual, when the groups of cells have a restraining power on one another which prevents any physiological over-activity.

From whatever cause the resisting power of the tissue elements is thus weakened, the invasion of other tissue elements is then allowed to take place. These being freed from the normal inhibiting power of the neighboring tissues, they form a new formation of a new growth. According to Ribbert it is the isolation, together with the latent capacity of isolated cells for unlimited proliferation, that gives rise to new growths.

Lamprey's "anaclasis" process to find an explanation of the formation of new growths in the absence of the histological differentiation of the cell associated with a corresponding increase in its proliferative power and a suspension, or loss, of its functional activity.

The greater the degree of anaclasis the more the tumour cells form in character and appearance to the embryonic type of cell and the more malignant is the new growth. A simple fibroma is a growth composed of fully formed fibrous tissue, and it may result in the formation of a new growth. According to Ribbert it is the isolation, together with the latent capacity of isolated cells for unlimited proliferation, that gives rise to new growths.

Some workers regard certain appearances in dividing cells found in cancer as evidence of a reversion of the somatic cell to the germinal cell type (heterotypal), otherwise found only among the nascent primordia which results in the formation of an embryo. These appearances are probably due to a pathological mitosis, commonly found in cancer, in which there is an increase in the number of chromosomes; some are cast out and become degenerate, others pass over to one of the daughter cells, leaving a reduced number in the other, and thus give rise to asymmetrical mitosis.

The histological structure of tumour cells is the only evidence that they resemble protoplasmic unicellular organisms in occasionally passing through a sexual process of reproduction, i.e., that nuclear conjugation between cells ever takes place.

In recent years the successful experimental transplantation of new growths, occurring sporadically in white mice and rats, into animals of the same species, has thrown a fresh light on all the features of malignant growths. From these experiments it is shown that cells taken from these growths and transplanted into animals of the same species give rise to a cancerous growth, whose cells have acquired unlimited powers of proliferation. They are descendants of the cells transplanted, and their mitotic residua give rise to "mixed tumours." The sarcomatous development may even completely outgrow the epithelial element and so form and continue to grow as a pure sarcoma.

The fact that it is possible to propagate these cells of one animal for many years in other animals of the same species, without any loss of power to form a sarcoma, is kept up by a growth-stimulating substance present in the proper species of animal; this substance, however, has not the power of transforming the normal tissue into a cancerous one.

Hensen, Bencke, Adami, Marchand and others have also put forward hypotheses to account for the origin of new growths. These observers maintain that the cells from some cause lose, or may never have had developed, their functional activity, and thus
**PATHOLOGY**

Fig. 30.—Anthracosis—coal-miner's lung—showing excessive accumulation of carbon pigment in the lymphatic spaces around the vessels of the lung. (× 50 diam.)

Fig. 36.—Polylobular cirrhosis, or "Gin-drinker's Liver," showing well-formed fibrous overgrowth which has divided up the liver tissue into irregular masses and caused atrophic and degenerative changes in the liver cells. (× 24 diam.)

Fig. 32.—Fibroblasts in young temporary granulation tissue. These are spindle shaped and have long processes. It is from these cells the permanent fibrous tissue is formed. (× 400 diam.)

Fig. 31.—Cells from inflammatory exudate showing active phagocytosis. The mono-nuclear cells are ingesting and digesting many of the polymorphonuclear leucocytes. Note that these phagocytic cells are pushing out protoplasmic processes (pseudopodia) by which they grasp their victims. (× 1000 diam.)

Fig. 33.—Healing abscess showing a wall of young cellular and vascular granulation tissue, which separates the pus area (top of Fig.) from the muscle fibres seen at lower part of Fig. (× 60 diam.)

Fig. 37.—Chronic interstitial myocarditis, showing the muscle fibres in the heart wall being separated and becoming atrophied by a slow fibrous overgrowth of the connective tissue. (× 300 diam.)

Fig. 34.—Granulation tissue showing the character and relation of the cellular elements to the new blood-vessels in the young temporary tissue. (× 200 diam.)
Fig. 22.—Tubercle bacilli in tissues from human lung in a case of acute phthisis. The bacilli are seen lying as short rods, singly and in clumps, in the caseous and degenerated tissues of the lung. ($\times 1000$ diam.)

Fig. 25.—Acute abscess in the kidney. A small cellular area formed by emigrated polymorphonuclear leucocytes surrounding a central mass of bacteria. ($\times 75$ diam.)

Fig. 23.—Inflammatory cells from acute exudate. Numerous polymorphonuclear leucocytes and a few mononuclear cells, one of which has taken up a leucocyte into its interior (phagocytosis). ($\times 600$ diam.)

Fig. 24.—Symmetrical gangrene of toes (3 months' duration), showing the sharp "line of demarcation" between the mummified toes and the more healthy tissue.

Fig. 26.—Fatty degeneration of heart from case of pernicious anaemia. Many of the muscle fibres show numerous droplets of oil seen as dark round granules. ($\times 200$ diam.)

Fig. 27.—Fatty degeneration of kidney from case of starvation. Black droplets of oil are seen in the epithelial cells lining the secreting tubules. ($\times 250$ diam.)

Fig. 28.—Muscle fibre greatly increased in size from hypertrophied heart. ($\times 400$ diam.)

Fig. 29. Muscle fibres from atrophied heart. (Contrast Fig. 28.) ($\times 400$ diam.)
acquire the activity of growth. The descendants of such cells will become more and more undifferentiated, thereby developing an increased vegetative activity.

Oertel finds an explanation of this want of complete cell differentiation, loss of function, and acquired vegetative activity in the anomaly of character of the nuclear chromatin elements of the cell, and maintains that the different properties of the cell are carried and handed down by the different orders of chromatin loops. We have analogies to this in the twofold type or a type of protoplasmic organization, for the purpose of propagation, the other being associated with the functional activities of the cell. Oertel thinks that in man we have these two different functions carried on by the same nucleus containing both chromatin orders. If, therefore, many of the chromatin loops are lost, the functional order be lost the descendants of such a cell, being unable to restore these loops, will be minus the functional attributes associated with the lost elements. These, having the full equipment of the vegetative character, will develop the inherent power of proliferation to a greater or lesser extent.

The foregoing hypotheses have all sought the origin of new growths in some intrinsic cause which has altered the characters of the cell or cells which gave rise to them, but none of them reached direct exciting cause. The parasitic hypothesis postulates the invasion of a parasite from without, thus making a new growth an infective process. Many cancer-parasites have been described in cancerousgrowth, including bacteria, yeasts and protozoa, but the innumerable attempts made to demonstrate the causal infective organism have all completely failed.

It is well known that cancer may develop in places where there has been an injury, can be found in the line of a surgical scar, and along the tongue following on prolonged irritation from a jagged tooth. Clay-pipes may also give rise to cancer of the lips in males in England, while cancer of the mouth of both sexes is common in India where chewing a mixture of tobacco and betel leaves is a part of the national practice. In the case of the squamous epithelial cancer of the anterior abdominal wall found so frequently in the natives of Kashmir, the position of the cancer is peculiar to this people, and is due to the chronic catarrhal granulomatous inflammation, burns from using the "kari"—small earthenware vessel containing a charcoal fire enclosed in basket work, and suspended round the waist, to assist in maintaining warmth in the extreme cold of the hills of Kashmir. This may be like a chemical, as is seen in the skin cancers that develop in workers in paraffin, petroleum, arsenic and aniline. However close the relationship is between chronic irritation and the starting of cancer, we are not in a position to say that irritation, physical or chemical, by itself can give rise to new growths, but it may merely act locally in some way, and so render that part susceptible to unknown tissue stimuli which impair to the cells that extraordinary power of proliferation characteristic of new growth.

At the present time we are quite uncertain what is the ultimate cause of new growths; in all probability there may be one or more complex factors at play disturbing that perfect condition of equilibrium now normal to the tissues. And we may consider the stimulated active vegetative cellular elements, or the more fully differentiated tissue, to develop and form tumours, simple or malignant.

Other Tissue Products

Mucoid.—In many pathological conditions we have degenerative products of various kinds formed in the tissues. These substances may be formed in the cells and given out as a secretion, or they may be formed by an intercellular transformation. In the mucinoid conditions, usually termed "mucoid" and "colloid" degenerations, we have closely allied substances which, like the normal mucins of the body, belong to the glycoproteids, and have in common similar physical characteristics. There is neither any absolute difference nor a constancy in their chemical reactions, and there can be brought about a transition of the "colloid" material into the "mucoid," or conversely. By mucoid is understood a soft gelatinous substance containing mucin, or pseudomucin, which is normally secreted by the epithelial cells of both the mucous membranes and glands. In certain pathological conditions an excessive formation and discharge of such material is usually associated with catarrhal changes in the epithelium. The desquamated cell substance gives rise to this mucic or gelatinous mass, which is less likely to become disorganized and blend with the secretion. Should this take place into a closed gland space it will give rise to cysts, which may attain a great size, as is seen in the ovarian adenoma. In some of the adenoid cancers of the alimentary tract this mucoid material is formed by the epithelial cells from which it flows out and infiltrates the surrounding tissues; both the cells and tissues appear to be transformed into this gelatinous substance, forming the so-called "colloid cancer" (fig. 42, PL IV.).

The connective tissue is supplied normally with a certain amount of these mucinoid substances, no doubt acting as a lubricant. In many pathological conditions this tissue is commonly found to undergo mucoid or myxomatous degeneration, which is regarded as a reduction of the physiologic type—that of formal connective tissue (fig. 43, PL IV.). These changes are found in senile wasting, in metastasis of carthage in many tumours, especially mixed growths of the parotid gland and testicle, and in various inflammations of the alimentary system. In the wasting of the thyroid gland in myxoe'dema, or when the gland is completely removed by opera'tion, myxomatous areas are found in the subcutaneous tissue of the skin, nerve-sheaths, etc.

Colloid.—This term is usually applied to a semi-solid substance of homogeneous and gelatinous consistence, which results partly from excretion and partly from degenerescence of cellular structure, more particularly of the epithelial type. These cells become swollen by this translucent substance and are thrown off into the space where they become fused together, forming colloid masses. This substance differs from the mucins by being precipitated by tannic acid but not by acetic acid, and being endowed with a higher proportion of sulphur.

In the normal thyroid there is formed and stored up in the spaces this colloid material. The enlarged cystic goitres show, in the distended vesicles, an abnormal formation and retention of this substance (fig. 44, PL V.). Its character is readily changed by the abnormal activities which take place in these glands during some of the acute fevers; the semi-solid consistence may become mucoid or even fluid.

Serous degeneration is met with in epithelial cells in inflammatory conditions, often following on burns. The vitality of these cells is being altered there is inhibition and accumulation of watery fluid in their cytoplasm, causing swelling and vacuolization of the cells. The bursting of several of these altered cells is the method by which the skin vesicles are formed in certain conditions.

Glycogen is formed by the action of a ferment on the carbohydrates—the starches being converted into sugars. The sugars are taken up from the circulation and stored in a less soluble form—known as "animal starch"—in the liver and muscle cells; they play an important part in the normal metabolism of the body. The significance of glycogen in large amounts, or of its absence from the tissues in pathological conditions, is not clearly understood. It is said to be increased in saccarine diabetes and to be greatly diminished in starvation and wasting diseases.

Fat.—Fatty accumulations in the tissues of the body are found in health and in pathological conditions; these are usually recognized and described as fatty infiltrations and fatty degenerations, but there are intermediate conditions which make it difficult to separate sharply the two. These fatty accumulations known as infiltrations (figs. 45 and 46, PL V.) are undoubtedly the result of excessive ingestion of food material containing more neutral fats than the normal tissues can oxidize, or these, as a result of defective removal owing to enfeebled oxidative capacities on the part of the tissues, become stored up in the tissues.

In acute and chronic alcoholism, in phthisis, and in other diseases this fatty condition may be very extreme, and is commonly found in association with other tissue changes, so that probably we should look on these changes as a degeneration.

Adiposity or obesity occurs when we have an excessive amount of fat stored in the normal connective-tissue areas of adipose tissue. It may be caused by various conditions, e.g. over-nutrition with lack of muscular energy, beer-drinking, castration, lactation, disturbed metabolism, some forms of insanity, and may follow on some fevers.

Fatty degeneration is a retrogressive change associated with the deposit of fatty granules or globules in the cytoplasm, and is caused by disorganized cellular activity (figs. 26 and 27, PL II.). It is frequently found associated with, or as a sequel to, cloudy swelling in intense or prolonged toxic conditions. Over and above the bacterial intoxications we have a very extreme degree of fatty degeneration, widely distributed throughout the tissues,
which is produced by certain organic and inorganic poisons; it is seen especially in phosphorus and chloroform poisoning.

The changes are also common in pernicious anaemia, advanced chlorosis, cachexia, in diabetes mellitus, in which there is marked derangement in metabolism, extreme fatty changes are occasionally found in the organs, and the blood may be stained with fat globules. This lipemic condition may cause embolism, the plugging especially occurring in the lung capillaries.

Fatty degeneration is common to all dead or decaying tissues in the body, and may be followed by calcification.

Autolysis is a disintegration of dead tissues brought about by the action of their own ferments, while degeneration takes place in the still living cell. The study of autolytic phenomena which closely simulates the changes seen in the degenerating cell has thrown much light on these degenerative processes.

These conditions may be purely physiological, e.g. in the mammary gland during lactation or in sebaceous glands, caused by increased functional activity. It may follow a diminished functional activity, as in the atrophying thymus gland and in the muscle cells of the uterus after parturition.

Any of the abnormal conditions that bring about general or local defective nutrition is an important factor in producing fatty degeneration.

The part played by fats and closely allied compounds in normal and pathological processes need not here be discussed, as the subject is too complex and the views on it are conflicting. It will be sufficient to state briefer what appears to be the result of recent investigation.

The neutral fats are composed of fatty acids and glycerin. In the pathological process of intestinal digestion, the precursors of such fats are split up into these two radicles. The free fatty acid radicle then unites with an alkali, and becomes transformed into a soluble soap which is then readily absorbed in this fluid condition by the epithelial cells of the mucous membrane. The soap is then acted on by ferments (lipases) and converted into neutral fat, which may remain in the cell as such. By the reverse action on the part of the same ferments in the cell, these neutral fats may be redissolved and pass into the lactic.

Many cells throughout the body contain this ferment. The soluble soaps which are probably conveyed by the blood will be quickly taken up by such cells, synthesized into neutral fats, and stored in a non-diffusible form till required. The fat in this condition is readily recognized by the usual chemical and staining reactions. As a food element essential to the carrying out of the vital energies of the cell, a certain amount of fatty matter must be present, in a form, however, unrecognizable by our present microchemical and staining methods.

Some investigators hold that the soaps may become combined with albumin, and that on becoming incorporated with the cytoplasm they can no longer be distinguished as fat. If some cause of this nature be true, it would appear that such combination of the cytoplasm, there will be a breaking down of that combination, so that the fat will be set free from the complex protein molecule in which it was combined as a soap-albumin, and will become demonstrable by the usual methods as an accessory droplets of oil. This splitting up of the fats previously combined with albumin in the cell by the action of natural ferments—lipases—and the setting free of the fats under the influence of toxins represent the normal and pathological process in the production of so-called fatty degeneration.

Calcification.—Calcification and calcareous deposits are extremely common in many pathological conditions.

There are few of the connective tissues of the body which may not become affected with deposits of calcareous salts (fig. 47, Pl. V.). This condition is not so frequently seen in the more highly differentiated cells, but may follow necrosis of secreting cells, as is found in the kidney, in corrosive sublimate poisoning and in chronic nephritis. These conditions are quite distinct from the normal process of ossification as seen in bone.

Many theories have been advanced to explain these processes, and recently the subject has received considerable attention. The old idea of the circulation of blood being supersaturated with lime salts in some way had first become liberated from atrophying bones, and then deposited, to form calcified areas in different tissues will have to be given up, as there is no evidence that this "metastatic calcification" ever takes place. In all probability no excess of soluble lime salts in the blood or lymph can ever be deposited in healthy living tissues.

At the present day both experimental and histological investigations seem to indicate that in the process of calcification there is a combination of the organic substances present in degenerated tissues, or in tissues of low vitality, with the lime salts of the body. The cause of this process may be the form of disorganization and undergo fatty degeneration, the fatty acids may become liberated and combine with the alkalies to form potash and soap soaps.

The potash and soap is then gradually replaced by calcium to form an insoluble calcium soap. This operation is termed calcification. The solubility of calcium salts is comparatively low. In states which are brought by the blood and lymph to the part results in the weaker fatty acids being replaced by phosphoric and carbonic acid, and thus in the formation of highly insoluble calcium phosphate and carbonate deposits in the mineralized tissues.

Pathological Pigmentation.—These pigmenations found in abnormal conditions are usually classified under (1) Albuminoid, (2) Haematoxygenous, (3) Extraneous.

1. The normal animal pigments and closely allied pigments are usually found in the skin, hair, eye, supra-renal glands, and in certain nerve cells. These represent the albuminoid series, and are probably elaborated by the cells from albuminous substances through the influence of specific ferments. This pigment is usually intracellular, but may be found lying free in the intercellular substance, and is generally in the form of fine granules of a yellowish-brown or brown-black colour. In the condition known as albinism there is a congenital deficiency or entire absence of pigment. Trophic and nervous conditions sometimes cause localized deficiency of pigment which produces white areas in the skin.

Excessive pigmentation of tissue cell (fig. 48, Pl. V.) is seen in old age, and usually in an accompaniment of certain atrophic processes and functional disorders. Certain degenerative changes in the supra-renal glands will lead to Addison's disease, which is characterized by an excessive pigmenation condition of the skin and mucous membranes. This melanin pigment is found in certain tumour growths, pigmented melanomata, sarcomata, lymphomata (fig. 49, Pl. V.) and cancer. The action of the sun's rays stimulates the cells of the skin to increase the pigment as a protection to the underlying tissues, e.g. summer bronzing, "freckles," and the skin of the negro.

The coloured fats, or lipochromes, are found normally in some of the cells of the internal organs, and under certain pathological conditions. This pigment is of a light yellow colour, and contains a fatty substance that reacts to the fat-staining reagents. Little is known regarding this class of pigment.

2. Haematoxygenous pigments are derived from the haemoglobin of the red blood corpuscles. These corpuscles may break down in the blood vessels, and their colouring material (haemoglobin) is set free in the serum. But their disintegration is more commonly brought about by "phagocytosis" on the part of the phagocytic cells in the different organs concerned with the function of haemolysis, i.e. the liver, spleen, haemolymph glands and other tissues.

The haemoglobin may be transformed into haematoxygenin, a pigment that does not contain iron, or into a pigment which does contain iron, haemosiderin.

The haematoxygenin pigment may vary in colour from yellowish or orange-red to a ruby-red, and forms granular masses, rhombic prisms or acicular crystals. It can be formed readily by introduction of ceric or potassium permanganate. These crystals are extremely resistant to absorption, are found in old blood clots, and have been known to persist in old cerebral haemorrhages after many years. Haematoxygenin in normal metabolism is largely excreted by the liver in the form of bilirubin.

Haemosiderin, an iron-containing pigment (probably an hydrated ferrous oxide), is found in more or less loose combination with protein substances in an amorphous form as brownish or black granules, cellular or disseminated. These crystals may appear to be essential for its development; it is found usually in the cells of certain organs, or it may be deposited in the intercellular tissues. Haemosiderin in the normal process of haemolysis is stored up in the cells of certain organs until required for the formation of this pigment in diseases where haemolysis is extreme. In particular, in pernicious anaemia, there are relatively large quantities occasionally as much as ten times the normal amount of haemosiderin deposited in the liver.

In hepatoxygenous pigmentation (icterus or jaundice) we have the iron-free pigment modified and transformed by the action of the liver cells into bile pigment (bilirubin). If the discharge of this

Fig. 39.—Secondary cancerous growth in heart wall. Note that the malignant cells are invading and destroying the muscle fibres of the heart. (x 75 diam.)

Fig. 40.—Fibroma. A simple tumour composed of well-differentiated fibrous tissue. The fibres are arranged in irregular bundles forming a dense firm tissue. (x 100 diam.)

Fig. 41.—Small round-celled sarcoma. A malignant tumour composed of undifferentiated masses of cells. These cells are readily carried to distant parts and give rise to secondary growths. (x 100 diam.)

Fig. 42.—"Colloid cancer of stomach" showing the cancer cells in the spaces being transformed into the "colloid material." (x 75 diam.)

Fig. 43.—Myxoma showing the stellate and branching cells with their processes interlacing and forming a network. The mucinoid substance is contained in the fine meshes. (x 100 diam.)
Fig. 44. — Thyroid gland — cystic goitre. The gland spaces vary in size and many may show marked cystic formation. These vesicles are filled with the colloid material. (x 90 diam.)

Fig. 45. — Liver. Fatty Infiltration. The liver cells are seen to contain a large globule of fat which pushes the cell nucleus to one side — giving the signet-ring appearance. (x 250 diam.)

Fig. 46. — Heart. Fatty Infiltration. The fat cells are increased and infiltrate the connective tissue between the bundles of muscle fibres. These are pressed upon and become atrophied, and may ultimately be replaced by adipose tissue. (x 40 diam.)

Fig. 47. — Pudic artery showing calcified areas in the muscular coat of the vessel. These degenerated parts are darkly stained owing to the calcareous particles having a strong affinity for the haemotoxylin stain. (x 35 diam.)

Fig. 48. — Brown atrophy of heart. The muscle fibres show the pigment granules, which are of a light yellow colour, situated specially at the poles of the fibre nucleus and extending short distance. (x 400 diam.)

Fig. 49. — Melanotic sarcoma. Many of these malignant cells develop and accumulate in their protoplasm granules of melanin pigment. (x 300 diam.)

Fig. 50. — Phagocytic cells (in sputum) which have taken into their protoplasm particles of carbon pigment. (x 500 diam.)

Fig. 51. — Liver. Waxy. The swollen waxy capillaries are pressing on the columns of liver cells and are causing marked atrophy. (x 75 diam.)
pigment from the liver by the normal channels be prevented, as by obstruction of the main bile ducts, the bile will accumulate until it regurgitates or is absorbed into the lymph and blood vessels, and is carried in a soluble state throughout the tissues, thus producing a general staining—an essential characteristic of jaundice.

3. In extraneous pigmentation we have coloured substances either in a solid or fluid state, gaining entrance into the organism and accumulating in certain tissues. The channels of entrance are usually by the respiratory or the alimentary tract, also by the skin. Pneumonokoniosis is due to the inhalation of minute particles of various substances—such as coal, stone, iron, steel, &c. These foreign particles settle on the lining membranes, and, by the action of certain cells (fig. 50, Pl. V. and fig. 30, Pl. III.), are carried into the tissues, where they set up chronic irritation of a more or less serious nature according to the nature of the inhaled particles.

Certain metallic poisons give rise to pigmentation of the tissues, e.g. in the blue line on the gums around the roots of the teeth due to the formation of lead sulphide or in chronic lead poisoning, where absorption may have taken place through the digestive tract, or, in the case of workers in lead and lead paints, through the skin. Prolonged ingestion of arsenic may cause pigmentation changes in the skin. If silver nitrate salts are administered for a long period as a medication, the skin that is exposed to light becomes of a bluish-grey colour, which is extremely persistent. These soluble salts combine with the albuminoids in the body and are deposited both in the connective tissue of the skin papillae, serous membranes, the intima of arteries and the kidney. This condition is known as argyria.

Various extraneous pigments may be deposited in the tissues through damaged skin surfaces—note, for example, the well-known practice of "tattooing." Many workers following certain occupations show pigmented scars due to the penetration of carbon and other pigments from superficial wounds caused by gunpowder, explosives, &c.

Hyaline.—This term has been applied to several of the transparent homogeneous appearances found in pathological conditions; it is, however, usually used to indicate the homogeneous structureless swellings which are found affecting the smaller arteries and the capillaries. The delicate connective-tissue fibrillae of the inner coat of the arteries are usually first and most affected. The fibrils of the outer coat also show the change to a less extent, while the degeneration very rarely spreads to the middle coat. This swelling of the walls may partly or completely occlude the lumen of the vessels.

Hyaline degeneration is found in certain acute injurious conditions; the toxins specially act on these connective-tissue cell elements. It also occurs in chronic inflammatory toxic conditions, such as subacute and chronic Bright's disease, lead poisoning and other obscure conditions. The hyaline material, unlike the amyloid, does not give the metachromatic staining reactions with methylene-blue or light green. The chemical constitution is not certain. The substance is very resistant to the action of chemical reagents, to digestion, and possibly belongs to the glyco-proteids.

Amyloid.—The wax-like or amyloid substance has a certain resemblance to the colloid, mucoid and hyaline. It has a firm gelatinous consistence and wax-like lustre, and, microscopically, is found to be homogeneous and structureless, with a translucency like that of ground-glass. Watery solution of iodine imparts to it a deep mahogany-brown colour; iodine and sulphuric acid occasionally, but not always, an azure-blue, methyl-violet, a brilliant rose-pink and methyl-green gives a reaction very much like that of methyl-violet, but not so vivid. The reaction with iodine is seen best by direct light; the reactions with the other substances are visible only by transmitted light.

The name "amyloid" was applied to it by Virchow on account of the blue reaction which it gives occasionally with iodine and sulphuric acid, resembling that given with vegetable cellulose. It is now known to have nothing in common with vegetable cellulose, but is regarded as one of the many albuminoid substances existing in the body under pathological conditions. Virchow's conjecture as to the starchy nature of the substance was disproved by Friedrich and Kekulé, who confirmed Professor Miller's previous finding as to its albuminous or protein nature. Oddi in 1894 isolated from the amyloid liver a substance which Schmiedeberg had previously obtained from cartilage and named "chondroitinic-sulphuric acid" (Chondroitinschwefelsäure). It also occurs in bones and elastic tissue, but is not present in the normal human liver. Oddi does not regard it as the essential constituent of amyloid, chiefly because the colour reactions are forthcoming in the residuum after the substance has been removed, while the substance itself does not give these reactions. Quite likely the amyloid may be a combination of the substance with a proteid. The soda combination of the acid as obtained from the nasal cartilage of pigs had the composition C$_9$H$_9$Na$_2$NSO$_7$.

Krawkow in 1897 clearly demonstrated it to be a proteid in firm combination with chondroitin-sulphuric acid. As probably the protein constituent varies in the different organs, one infers that this will account for the varying results got from the analysis of the substance obtained from different organs in such cases.

This amyloid substance is slowly and imperfectly digested by pepsin—digestion being more complete with trypsin and by autolytic enzymes.

There is no evidence that this material is brought by the circulating blood and infiltrates the tissues. It is believed rather that the condition is due to deleterious toxic substances which act for prolonged periods on the tissue elements and so alter their histion proteins that they combine in situ with other protein substances which are brought by the blood or lymph.

Amyloid develops in various organs and tissues and is commonly associated with chronic phthisis, tuberculous disease of bone and joints, and syphilis (congenital and acquired). It is known to occur in rheumatism, and has been described in connexion with a few other diseases. A number of interesting experiments, designed to test the relationship between the condition of suppuration and the production of amyloid, have been made of late years. The animal most suitable for experimentation upon is the ferret, but other animals have been used in the same way, employing the frequent subcutaneous injection of the usual organisms of suppuration, have induced in the fowl the deposition within the periphery of a homogeneous substance giving the colour reactions of true amyloid. When hardened in spirit, &c., this part of the experimental amyloid in the fowl vanishes, and the reactions are not forthcoming. They were unable to verify any direct connexion between its production and the organism of tubercle. These observations were verified in the rabbit, mouse, fowl, guinea-pig and cat by Davidsohn, occasionally in the dog by Lubarsch; and confirmatory observations have also been made by Cœnny and Maximoff. Lubarsch succeeded in inducing the same substance by the subcutaneous injection of turpentine: it produces its result, it is said, by exciting an abscess. Nowak, however, found later that he could generate it where the turpentine failed to induce suppuration; he believes that it may arise quite apart from the organisms of suppuration. It is not a biological product of the micro-organisms of disease, and also that it has nothing to do with emaciation. It is a retrogressive process producing characteristic changes in the fine connective-tissue fibrillae of the vessels. The change appears to begin in the fibrils which lie between the circular muscle fibres of the middle coat of the smaller arterioles and extends both backwards and forwards along the vessels. It spreads forwards, affecting the supporting fibres outside the intermediate coat of the vessels, and brings about the connective-tissue fibrillae of the vessels. The secreting cells never show this change, although they may become atrophied or destroyed by the pressure and the disturbance of nutrition caused by the hardening of the amyloid substance. The circulation is little interfered with, although the walls of the vessels are much thickened by the amyloid material (fig. 51, Pl. IV.).

Amyloid Bodies.—These are peculiar bodies which are found in the prostate, in the central nervous system, in the lung, and in other localities, and which get their name from being very like starch-corpuscles, and from giving certain colour reactions closely resembling those of vegetable cellulose or even starch itself. They are minute structures having a round or oval shape, concentrically striated, and frequently showing a small nucleus-like body or cavity in their centre. Iodine gives usually a dark brown reaction, somet-
in giving all its colour reactions. The reaction with methyl-
vyolet, however, differs from that with true amyloid in being
evanescent.

RESPONSE OF TISSUES TO STIMULATION

A stimulus may be defined as every change of the external
agencies acting upon an organism; and if a stimulus come in
contact with a body possessing the property of irritability, i.e.
the capability of reacting to stimuli, the result is stimulation
(Verworn). Stimuli comprise chemical, mechanical, thermal,
photic and electrical changes in the environment of the
body. A stimulus may act on all sides and induce a general effect
without direction of movement, but in the production of movement
in a definite direction the stimulus must be applied unilaterally.
Stimuli applied generally, not unilaterally, in most cases induce
increased divisibility of the cells of the part.

Thus the poison of various insects induces in plants the cellular
new formation known as a gall-nut; a foreign body implanted
in a limb may become encysted in a capsule of fibrous tissue; septic
matter introduced into the abdomen will cause proliferation of the
lining endo(epithelium; and placing an animal (salamander, Galectti)
in an ambient medium at a higher temperature than that to
which it is accustomed naturally, increases the rapidity of
division of its epithelium with augmentation of the number of
karyokinetic, mitotic action upon the epithelial cells, and probably,
luxuriantly, bone-forming action (salamander, Galectti). In the
living organism this may be observed in different circumstances.
Bone (e.g. drill-bones) may develop in a soft tissue with no natural
bone-forming tendencies, as a result of interrupted pressure, or a
fatty tumor may arise in the midst of the natural subcutaneous
fat in the same circumstances.

Among stimuli acting unilaterally, perhaps none has proved
more interesting, in late times, than what is known as Chemio-
taxis. By it is meant the property an organism endowed with
the power of movement has to move towards or away from a
chemical stimulus applied unilaterally, or, at any rate, where it is
applied in a more concentrated state on the one side than on the
others, and more particularly where the concentration increases
gradually in one direction away from the living organism acted
upon. Observed originally by Engelmann in bacteria, by Stahl
in myxomycetes, and by Pfeiffer in ferns, mosses, &c., it has
now become recognized as a widespread phenomenon. The
influence of the chemical substance is either that of attraction
or repulsion, the one being known as positive, the other as
negative chemiotaxis.

The female organs of certain cryptogams, for instance, exert a
positive chemotactic action upon the spermatozoids, and, as
Pfeiffer suggests, the chemical agent which exerts the influence
is malic acid. No other substance, at least, with which he experi-
mented had a like effect, and it is possible that in the archeonium
which bears the sex-cells the chemical play the part of a poisons,
f ibers. Bordet, Leber, Metchnikoff and others have studied the
phenomenon in leucocytes, with the result that while there is evidence of
their being positively chemiotactic to the toxins of many pathogenic
organisms, it is found that they are negatively influenced by
such substances as lactic acid.

From a pathological point of view the subject of chemiotaxis
must be considered along with that of phagocytosis. Certain
free mobile cells within the body, such as blood-leucocytes, as
well as others which are fixed, for instance the endothelium of the
hepatic capillaries, have the property of seizing upon some
kinds of particulate matter brought within their reach. Within
a quarter of an hour after a quantity of cinnamon has been injected
into the blood of the frog nearly every particle will be found
gulped up by the protoplasm of the leucocytes of the circulating
blood. Some bacteria, such as those of anthrax, are seized upon
in the same manner, indeed; very much as small algae and other
particles are incorporated and devoured by amoeba. Melanine
particles formed in the spleen in malaria, which pass along with the
blood through the liver, are appropriated by the endothelial
cells of the hepatic capillaries, and are found embedded within
their substance. If the particle enveloped by the protoplasm
be of an organic nature, such as a bacterium, it undergoes
digestion, and ultimately becomes destroyed, and accordingly
the term "phagocytes" is now in common use to indicate cells
having the above properties. This phagocytic action of certain
cells of the body is held by Metchnikoff and his followers to
have an important bearing on the pathology of immunity.
Phagocytes act as scavengers in ridding the body of noxious
particles, in more or less efficient manner.

A further application of the facts of chemiotaxis and phago-
cytosis has been made by Metchnikoff to the case of Infammation.
It is well known that many attempts to define the process of
Inflammation have been made from time to time, all of them more
or less unsatisfactory. Among the latest is that of Metchnikoff:
"Inflammation generally," he says, "must be regarded as a
phagocytic reaction on the part of the organism against irritants.
This reaction is carried out by the mobile phagocytes sometimes
alone, sometimes with the aid of the vascular phagocytes, or of
the nervous system." Given a noxious agent in a tissue, such,
let us say, as a localized deposit of certain bacteria, the phago-
cytes swarm towards the locality where the bacteria have taken
up their residence. They surround individual bacteria, absorb
them into their substance, and ultimately destroy them by diges-

tion. The phagocytes are attracted from the blood vessels
and elsewhere towards the noxious focus by the chemiotaxis exerted
upon them by the toxins secreted by the bacteria contained
within it. The chemotaxis is so intense that the toxins from certain other bacteria may act negatively; and such
bacteria are fraught with particular danger from the fact that
they can spread through the body unopposed by the phagocytes,
which may be looked upon as their natural enemies.

NATURAL PROTECTION AGAINST PARASITISM

The living organism is a rich storehouse of the very materials
from which parasites, both animal and vegetable, can best derive
their nourishment. Some means is necessary, therefore, to
protect the one from the encroachments of the other. A plant
or animal in perfect health is more resistant to parasitical invasion
than one which is ill-nourished and weakly. Of a number of
plants growing side by side, those which become infected with
moulds are the most weakly, and an animal in low health is
more subject to contagious disease than one which is robust.
Each organism possesses within itself the means of protection
against parasitical enemies, and these properties are more in
evidence when the organism is in perfect health than when it
is debilitated.

One chief means employed by nature in accomplishing this
object is the investment of those parts of the organism liable to
be attacked with an armour-like covering of epidermis, periderm,
bark, &c. The grape is proof against the inroads of the yeast-
philoxera, for the skin is so thick that the hulk is intact, but on the hulk being injured the
yeast-plant finds its way into the interior and sets up vinous
fermentation of its sugar. The root of the French vine is attacked
by the Phylloxera, but that of the American vine, whose epidermis is not protected from it. The larch remains
free from parasitism so long as its covering is intact, but as soon as this is
pierced by insects, or its continuity interfered with by cracks or
fissures, the Peziza penetrates, and before long brings about the
destruction of the branch. So long as the epidermis of animals
remains sound, disease germs may come in contact with it almost
without impunity, but immediately on its being assurred, or a larger
wound made through it, the underlying parts, the blood and soft
tissues, are attacked by them. A very remarkable instance of an
acquired means of protecting a wound against parasitical invasion
is to be found in granulations. Should these remain unbroken
they constitute a natural barrier to the penetration of most patho-
generative forms. To other injuries the body is protected from the
insects and other parasitical enemies by the protoplasm of
various kinds which alight upon their surfaces begin to
fructify in abundance, but are rapidly destroyed as they burrow
deeply. This is accomplished by a twofold agency, for while numbers of the
organisms seized upon by them are broken up and dissolved by the liquid filling the granulation
interstices (Ananassief). This latter, or histolytic, property is not
confined to the liquid of granulations; normal blood-serum possesses
a similar extent of activity. The body possesses in a way a second
very much excited. Jürgellins makes out that when an animal
is rendered immune to a particular micro-organism this histolytic
property becomes exalted.

DROPSY

During conditions of health a certain quantity of lymphic liquid
is constantly being effused into the tissues and serous cavities
of the body, but in the case of the tissues it never accumulates
to excess, and in that of the serous cavities it is never more than
sufficient to keep them moist. When any excessive accumulation takes place the condition is known as “hydrops” or “dropsy.” A “transudate” is a liquid having a composition resembling that of blood-serum, while the term “exudate” is applied to an effused liquid whose composition approaches that of the blood-plasma in the relationship of its solid and liquid parts, besides in most cases containing numbers of colourless blood-corpuscles. Exudates are poured out under inflammatory conditions, while none of the truly dropsal effusions are of inflammatory origin; and hence the class of exudates, as above defined, may be rejected from the category of liquids we are at present considering. Where the dropsal condition is more or less general the term “anasarca” is applied to it; if the tissues are infiltrated locally the term “oedema” is employed; and various names are applied, with a local significance, to dropsal effusions of individual parts or cavities, such as “hydrothorax,” “hydro-peritoneum” or “ascites,” “hydrocephalus,” and so on. In “anasarca” the tissues which suffer most are those which are peculiarly lax, such as the lower eyelids, the scrotum, and the backs of the hands and feet. It is invariably the result of some cause, not sufficiently anything such as renal disease, valvular defect of the heart, or an impoverished state of the blood; while a mere oedema is usually dependent upon some local obstruction to the return of blood or lymph, or of both, the presence of parasites within the tissue, such as the filariae sanguinis hominis or trichina spiralis, or the poisonous bites of insects. Dropsal of the serous cavities is very commonly merely a part of a general anasarca, although occasionally it may be, as in the case of ascites, the sequel to an obstruction in the venous return. Dropsal liquids are usually pale yellow or greenish, limpid, with a saltish taste and alkaline reaction, and a specific gravity ranging from 1025 to 1034. They all contain albumen and throw down a precipitate with heat and nitric acid. None of them, in man, coagulate spontaneously, although they contain fibrinogen. The addition of some of the liquid squeezed out from a blood-clot, of the squeezed blood-clot itself, or of a little blood-serum, is sufficient to throw down a fibrinous coagulum (Buchanan), evidently by these substances supplying the fibrin-ferment. The proteid constituents are very much like those of blood-serum, although they never come up to them in amount (Runenberg). Certain peculiar substances, probably degenerative products, some of them reducing copper, are occasionally met with. The liquid of ascites sometimes contains chyle in abundance (hydrops lacteus), the escape having taken place from a ruptured receptaculum chyli.

In a given case of anasarca due to a cause acting generally, it will be found that a certain heavy fluid, the highest percentage of proteid, that of the peritoneal cavity comes next, that of the cerebral ventricles follows this, and the liquid of the subcutaneous areolar tissue contains the lowest. The reason of this is apparently that the negative pressure of the bag and the osmotic and peritoneal cavity tend to aspirate a liquid relatively thicker, so to speak, than that effused where no such extraneous mechanism is at work (James).

The subject of the conditions under which dropsal liquids are poured has been one of wide question, and one about which there is the greatest diversity of opinion. It turns in part, but in part only, upon the laws regulating the effusion of lymph, and physiologists are by no means at one in their conclusions. It is plain that the lymph-flow is dependent upon two factors, first, difference in pressure of the blood in the capillaries and the liquid in the plasma spaces outside; and, secondly, chemical interchanges setting up osmotic currents throughout. This has been very clearly brought about by the secretory function of the endothelial cells. Starling who finds that the amount of lymph-flow from the thoracic duct is dependent upon difference in pressure. It varies with the increase of the intracapillary or decrease of the extra- capillary pressure, regulated by the lesser permeability of the vessel-walls. Heidenhan, on the other hand, rejected entirely the filtration view of lymph-formation, believing that the passage of lymph across the capillary wall is a true blood return by the secretory function of the endothelial plates. Starling does not accept this view, and cannot regard as an article of faith Heidenhan’s dictum that normally filtration plays no part in the formation of lymph. Lazarus-Barlow, again, looks upon the pouring out of lymph as evidence of the demands of the tissue-elements for nutrition. An effusion is communicated to the blood vessels in accordance with this demand, and a greater or smaller outflow is the result. It traces various local dropsal to the starvation from which the tissues are suffering, and the increased capillary permeability in the effort of the organism to meet this demand for more nourishment. It may be asked, however, whether a dropsal tissue is being held in a high state of nutrition, and whether, on the contrary, the presence of lymph in excess in its interstices suggests deficiency in supply rather than a demand for transport. According to Rogowicz and Heidenhan, certain substances increase the quantity of lymph given off from a part by acting upon the cells of the capillary wall; they hold, in fact, that these substances, true lymphogenes, are derived from two classes, first, such substances as peptone, leech extract and crayfish extract; and, secondly, crystalloids such as sugar, salt, &c. Starling sees no reason to believe that members of either class act otherwise than by increasing the pressure in the capillaries or by affecting the endothelial permeability. He states that the first class influence the endothelial plates of the capillaries injuriously, inducing thereby increased permeability; those of the second class (sugar, &c.), on injection into the blood, attract water from the capillaries, there be a change in the relations of the lymphatic should impede its increased capillary pressure. The increased flow of lymph is due to the increased pressure in the abdominal capillaries.

It is now coming to be recognized that increase of blood pressure alone is not sufficient to cause lymph formation. More important is the effect of the alteration in the amount of crystalloids in the tissues and blood and therefore of the alteration in the osmotic pressure between these. Loeb found experimentally that if the capillary pressure is increased by the introduction of a hyperosmolar solution of glucose or fructose in the peritoneal cavity, and so it would absorb water from a relatively concentrated sodium chloride solution. Welsh produced oedema of the lungs experimentally by increasing the pressure in the pulmonary vessels in a dog, and found that the fluid excreted from the lung vessels was blood pressure only about one-tenth of an atmosphere, while in some of Loeb’s experiments the osmotic pressure, due to retained metabolic products, was equal to over thirty atmospheres. Thus differences in capillary osmotic pressure must be considered powerful in producing oedema than mere differences in blood pressure.

Now differences in the amount of crystalloids cause alteration in osmotic pressure while the proteid content affects it but little; thus it appears that crystalloids the chlorides appear to be those most liable to variation.

Widal, Lemierre and other French observers have noted a diminution in the excretion of chlorides in nephritis associated with oedema; Widal and Javal found that a chloride-free diet caused diminution in the oedema and a chloride containing diet an increase of oedema. Oliver and Audibert published some cases of cirrhosis of the liver with ascites in which they got results comparable to those of Widal. Some other observers, however, have negat such good results with a chloride-free diet, and Mährisch, Scheel, Limbeck, Dreser and others, dispute Widal’s hypothesis of a retention of chlorides as being the cause of oedema, in the case of renal dropsal at all events; they assert that the chlorides are excreted in order to diminish the chloride which they assume to have been effused, equal to that of the blood and tissues. Certainly not all cases of renal dropsal show diminution in the excretion of chlorides. Bainbridge suggests that a retention of metabolic products may cause the oedema in renal disease, Bradford having previously shown that loss of a certain amount of renal tissue caused retention of metabolic products in the tissues. As sodium chloride is one of the most permeable of the crystalloids it may be one of the chief causes of the retention of oedema.

Cushny has shown experimentally that slowing of the blood-flow through renal tissue causes less sodium chloride to appear in the urine while the exclusion of urea and sulphates is not affected; while experimentally decreasing the ionic permeability, being more permeable, is reabsorbed and so only appears to be excreted in less quantity.

In the dropsal of cardiac disease, owing to the deficient oxidation of the blood from the addition of metabolic products to the stagnant blood in the vessels; also lymph return must be impeded by the increased pressure in the veins and so dropsal results (Wells).

The local oedema seen in some nervous affections might be explained by the hypothesis of increased metabolic activity in these areas due to some local nervous stimulation.

Thus, while increased pressure in the blood or lymph vessels may be one factor, and increased permeability of the capillary endothelium another, increased metabolic activity in the tissues is probably the most important in the production of dropsal. This increased osmotic pressure is again due to accumulation of crystalloids in the tissues, either products of metabolism due to deficient oxidation from alteration in the blood or other causes. As has been mentioned the dropsal in the tissues gives rise to a retention or reabsorption of chlorides in the tissues.

**Practical Applications**

Medicine and surgery have never been slow to appropriate and apply the biological facts of pathology, and at no period have
they followed more closely in its wake than during the last quarter of the 19th century. When, for instance, the cause of septic infection had been revealed, the prophylaxis of the disease became a possibility. Seldom has it happened, since the discovery of the law of gravity, that so profound an impression has been made upon the scientific world at large as by the revelation of the part played by germ-life in nature; seldom has any discovery been fraught with such momentous issues in so many spheres of science and industry. The names of Pasteur and Lister will descend to posterity as those of two of the greatest figures in the annals of medical science, and indeed of science in general, during the 19th century. The whole system of treatment of tubercular disease has been altered by the discovery of the tubercle microbe. Previously consumptive individuals were carefully excluded from contact with fresh air, and were advised to live in rooms almost hermetically sealed and kept at a high temperature. The treatment of the disease has now gone off in the opposite direction. Sanatoria have started up all over Europe and elsewhere for its treatment on the open-air principle. Individuals suffering from pulmonary tuberculosis are encouraged to live in open and, with the best results. The rapid diagnosis of diphtheria, by recognizing its bacillus, has enabled the practitioner of medicine to commence the treatment early, and it has also enabled the medical officer of health to step in and insist on the isolation of affected persons before the disease has had time to spread. The discovery of the parasite of malaria by Laveran, and of the method by which it gains entrance to the human body, through the bite of a particular variety of mosquito, by Manson and Ross, promises much in the way of eradication of the disease in the future. One of the most remarkable practical outcomes of germ-pathology, however, has been the production of the immunized sera now employed so extensively in the treatment of diphtheria and other contagious diseases. By the continuous injections under the skin, in increasing doses, of the toxins of certain pathogenic micro-organisms, such as that of diphtheria, an animal—usually the horse—may be rendered completely refractory to the disease. Its serum in course of time is found to contain something (an antitoxin) which has the power of neutralizing the toxin secreted by the organism when parasitical upon the body. This immunity can be transferred to a fresh host (e.g. man) by injecting such serum subcutaneously. The modern system of hygiene is in great part founded upon recent pathology. The recognition of the dangers accompanying the drinking of polluted water or milk, or of those attached to the breathing of a polluted-atmosphere, has been the natural sequence of an improved knowledge of pathology in its bacteriological relationships. Skin-grafting and regeneration of bone are among not the least remarkable applications of pathological principles in the combat with disease in recent times; and in this connexion may also be mentioned the daring acts of surgery for the relief of tumours of the brain, rendered practicable by improved methods of localization, as well as operations upon the serous cavities for diseased conditions within them or in their vicinity.

For the special pathological details of various diseases, see the separate articles on PARASITIC DISEASES; NEURO-PATHOLOGY; DIGESTIVE ORGANES; RESPIRATORY SYSTEM; BLOOD: Circulation; METABOLIC DISEASES; FEVER; BLADDER; KIDNEYS; SKIN DISEASES; EYE DISEASES; HEART DISEASE; EAR, &c.; and the articles on different diseases and ailments under the headings of their common names.
PATIALA, or PUTTIALA, a native state of India, within the Punjab. It is the premier state of the Punjab, and chief of the three Sikh Phulkian states—Patiala, Natha and Jind. It consists of three detached blocks of territory, mostly in the plains, though one portion extends into the hills near Simla. Area 5412 sq. m.; pop. (1901), 1,566,602; estimated revenue, £4,400,000; military force (including Imperial Service troops), 3,429 men. The state was founded by a Sikh chief, about 1564, and came under British protection, with the other cis-Sutlej states, in 1809. Patiala remained conspicuously loyal to the British during the Mutiny of 1857, Narinder Singh, its ruler, setting an example to the other Sikh states which was of the utmost value. The maharaja, Rajendra Singh, who died in 1900, was devoted to riding and sport. He took part personally in the Tirah campaign of 1897-98, with a battalion of his own Imperial Service infantry and a field troop of Imperial Service lancers. In recognition of his services on this occasion he received the G.C.S.I. He was succeeded by his son, Bhupinder Singh, who was born in 1857. The town of Patiala has a station on the branch of the North Western railway from Rajpura to Bhatinda. Pop. (1901), 53,543. It contains several fine modern buildings, including palaces, hospitals and schools.

See Phulkian States Gazetteer (Lahore, 1909).

PATIENCE, the name given to certain card-games played by a single person. Although known for centuries, they have seldom been mentioned by writers on playing-cards, and the rules have for the most part been handed down orally. There are two main varieties; in one luck alone prevails, since the player has no choice of play but must follow strict rules; in the other an opportunity is given for the display of skill and judgment, as the player has the choice of several plays at different stages of the game. The usual object is to bring the cards into regular ascending or descending sequences. The starting card is called the "foundation," and the "family" (sequence) is "built" upon it. In other varieties of Patience the object is to make pairs, which are then discarded, the game being brought to a successful conclusion when all the cards have been paired; or to pair cards which will together make certain numbers, and then discard, as before. There are hundreds of Patience games, ranging from the simplest to the most complicated.

See Jacob's Games of Patience in De la Rue's series of handbooks (1905); Patience Games, by "Cavendish" (London, 1890); Cyclopaedia of Card and Table Games, by Professor Hoffmann (London, 1891); Patience Games, by Professor Hoffmann (London, 1892); Games of Patience, by A. Howard Cady (Spalding's Home Library, New York, 1896); Dutch Games of Patience, edited by W. B. and H. B. Dick (New York, 1898); Games of Patience (4 series), by Mary E. W. Jones (London, 1898); Le Livre illustré des patience, by "Comtesse de Blanccoeur" (Paris, 1898).

PATINA (probably from the Latin word for a flat dish, from palere, to lie open; cf. "paten"), a thin coating or incrustation which forms on the surface of bronze after exposure to the air or burial in the ground. It is looked on as a great addition to the beauty of the bronze, especially when it is of the green colour found on antique bronzes (see BRONZE). By extension, the word is used to denote the discoloured or incrusted surface of marble, flint, &c., acquired after long burial in the ground or exposure to the air, and also to the special colour given to wood surfaces by time.

PATIÑO, JOSÉ or JOSEF (1666-1736), Spanish statesman, was born at Milan, on the 11th of April 1666. His father, Don Lucas Patiño de Ibarra, Señor de Castelar, who was by origin a Galician, was a member of the privy council and inspector of the troops in the duchy of Milan for the king of Spain, to whom it then belonged. His mother's maiden name was Beatrice de Rosales y Facini. The Patiño family were strong supporters of the Bourbon dynasty in the War of the Spanish Succession. The elder brother Baltasar, afterwards marquis of Castelar, had a distinguished career as a diplomatist, and his son Lucas was a general of some note. José Patiño, who had been intended for the priesthood but adopted a secular career, was granted the reversion of a seat in the senate of Milan on the accession of Phillip V. in 1700, but on the loss of the duchy he was transferred to Spain, and put on the governing body of the military orders in 1707. During the War of Succession he served as intendent of Estremadura, and then of Catalonia from 1711 to 1718. In 1717 he was named intendent of the navy, which had just been reorganized on the French model. His capacity and his faculty for hard work secured him the approval of Alberoni, with whom, however, he was never on very friendly terms in private life. Patiño's Italian education, which affected his Spanish style, and caused him to fall into Italianisms all through his life, may have served to recommend him still further.

Patiño profoundly distrusted the reckless foreign policy undertaken by Alberoni under the instigation of the king and his obstinate queen, Elizabeth Farnese. He foretold that it would lead to disaster, but as a public servant he could only obey orders, and he had the chief merit of organizing the various expeditions sent out to Sardinia, Sicily and Crete between 1718 and 1720. He became known to the king and queen in the latter year, while he was acting as a species of commissary-general during the disastrous operations against the French troops on the frontier of Navarre. It was not, however, until 1726 that he was fully trusted by the king. He and his brother, the marquis of Castelar, were the chief opponents of the adventurer Ripperdà, who captivated the king and queen for a time. On the fall of this remarkable person, Patiño was named secretary for the navy, the Indies—that is to say the colonies—and for foreign affairs. The war office was added to the other departments at a later date. From the 13th of May 1726 until his death on the 3rd of November 1736 Patiño was in fact prime minister. During the latter part of his administration he was much engaged in the laborious negotiations with England in relation to the disputes between the two countries over their commercial and colonial rivalries in America, which after his death led to the outbreak of war in 1739.

In his Patiño y Campillo (Madrid, 1882), Don Antonio Rodriguez Villa has collected the dates of the statesman's life, and has published some valuable papers. But the best account of Patiño's administration is to be found in Cossé's Memoirs of the Kings of Spain of the House of Bourbon (London, 1815), which is founded on the correspondence of the English ministers at Madrid.

PATIO, the Spanish name for an inner court or enclosed space in a house, which is open to the sky. The "patio" is a common feature in houses in Spain and Spanish America. The word is generally referred to the Lat. palere, to lie open; cf. "patent," or to spatium, space.

PATKUL, JOHANN REINHOLD (1660-1707), Livonian politician and agitator, was born in prison at Stockholm, where his father lay under suspicion of treason. He entered the Swedish army at an early age and was already a captain when, in 1689, at the head of a deputation of Livonian gentry, he went to Stockholm to protest against the rigour with which the land-recovery project of Charles XI was being carried out in his native province. His eloquence favourably impressed Charles XI, but his representations were disregarded, and the offensive language with which, in another petition addressed to the king three years later, he renewed his complaints, involved him in imprisonment. To save himself from the penalties of high treason, Patkul fled from Stockholm to Switzerland, and was condemned in contumacia to lose his right hand and his head. His estates were at the same time confiscated. For the next four years he led a vagabond life, but in 1698, after vainly petitioning the new king, Charles XII, for pardon, he entered the service of Augustus the Strong of Saxony and Poland, with the deliberate intention of wresting from Sweden Livonia, to which he had now no hope of returning so long as that province belonged to the Swedish Crown. The aristocratic republic of Poland was obviously the most convenient suzerain for a Livonian nobleman; so, in 1698, Patkul proceeded to the court of the king-elector at Dresden and bombarded Augustus with proposals for the partition of Sweden. His first plan was a combination against her of Saxony, Denmark and Brandenburg; but, Brandenburg failing him, he was obliged very unwillingly to admit Russia into the partnership. The tsar was to be content with Ingria and Estonia, while Augustus was
to take Livonia, nominally as a fief of Poland, but really as an hereditary possession of the Saxon house. Military operations against Sweden's Baltic provinces were to be begun simultaneously by the Saxons and Russians. After thus forging the first link of the partition treaty, Patkul proceeded to Moscow, and, at a secret conference held at Preobrazhenskoye, easily persuaded Peter the Great to accede to the nefarious league (Nov. 11, 1699). Thoughout the earlier, unluckier days of the Great Northern War, Patkul was the mainstay of the confederates. At Vienna, in 1702, he picked up the Scottish general George Benedict Ogilvie, and enlisted him in Peter's service. The same year, recognizing the unprofitableness of serving such a master as Augustus, he exchanged the Saxon for the Russian service. Peter was glad enough to get a man so famous for his talents and energy, but Patkul speedily belied his reputation. His knowledge was too local and limited. On the 19th of August 1704 he succeeded, at last, in bringing about a treaty of alliance between Russia and the Polish republic to strengthen the hands of Augustus, but he failed to bring Prussia also into the anti-Swedish league because of Frederick I's fear of Charles and jealousy of Peter. From Berlin Patkul went on to Dresden to conclude an agreement with the imperial commissioners for the transfer of the Russian contingent from the Saxon to the Austrian service. The Saxon ministers, after protesting against the new arrangement, arrested Patkul and shut him up in the fortress of Sonnenstein (Dec. 19, 1705), altogether disregarding the remonstrances of Peter against such a gross violation of international law. After the peace of Altranstädt (Sept. 24, 1707) he was delivered up to Charles, and at Kazimierz in Poland (Oct. 10, 1707) was broken alive on the wheel, Charles rejecting an appeal for mercy from his sister, the princess Ulrica, on the ground that Patkul, as a traitor, could not be pardoned for example's sake.

PATMORE, COVENTRY KERSEY DIGHTON (1833–1866), English poet and critic, the eldest son of Peter George Patmore, himself an author, was born at Woodford in Essex, on the 23rd of July 1833. He was privately educated, being his father's intimate and constant companion, and derived from him his early literary enthusiasm. It was his first ambition to become an artist, and he showed much promise, being awarded the silver palette of the Society of Arts in 1838. In the following year he was sent to school in France, where he studied for six months, and began to write poetry. On his return his father contemplated the publication of some of these youthful poems; but in the meanwhile Coventry had evinced a passion for science and the poetry was set aside. He soon, however, returned to literary interests, moved towards them by the sudden success of Tennyson; and in 1844 he published a small volume of Poems, which was not well received, but was marked by inequalities of workmanship. It was widely criticized, both in praise and blame; and Patmore, distressed at its reception, bought up the remainder of the edition and caused it to be destroyed. What chiefly wounded him was a cruel review in Blackwood, written in the worst style of unreasoning abuse; but the enthusiasm of private friends, together with their wiser criticism, did much to help him and to foster his talent. Indeed, the publication of this little volume bore immediate fruit in introducing its author to various men of letters, among whom was Dante Gabriel Rossetti, through whose offices Patmore became known to Holman Hunt, and was thus drawn into the eddies of the pre-Raphaelite movement, contributing his poem "The Seasons" to the Germ. At this time Patmore's father became involved in financial embarrassments; and in 1846 Monckton Milnes secured for the son an assistantship in the British Museum, a post which he occupied industriously for nineteen years, devoting his spare time to poetry. In 1847 he married Emily, daughter of Dr Andrews of Camberwell. At the Museum he was austere and remote among his companions, but was nevertheless instrumental in 1852 in starting the Volunteer movement. He wrote an important letter to The Times upon the subject, and stirred up much martial enthusiasm among his colleagues. In the next year he republished, in Tamerton Church Tower, the more successful pieces from the Poems of 1844, adding several new poems which showed distinct advance, both in conception and treatment; and in the following year (1854) appeared the first part of his best known poem, "The Angel in the House," which was continued in "The Expousals" (1856), "Faithful for Ever" (1860), and "The Victories of Love" (1862). In 1862 he lost his wife, after a long and lingering illness, and shortly afterwards joined the Roman Catholic Church. In 1865 he married again, his second wife being Miss Marianne Byles, second daughter of James Byles of Bowden Hall, Gloucester; and a year later purchased an estate in East Grinstead, the history of which may be read in How I Managed my Estate, published in 1886. In 1877 appeared The Unknown Eros, which unquestionably contains his finest work in poetry, and in the following year Andrew, his own favourite among his poems, together with an interesting passage, though by no means indisputable, essay on English Metrical Law. This departure into criticism he continued further in 1879 with a volume of papers, entitled Principle in Art, and again in 1893 with Religio poetae. Meanwhile his second wife died in 1886, and in the next year he married Miss Harriet Robson. In later years he lived at Lympington, where he died on the 26th of November 1896.

A collected edition of his poems appeared in two volumes in 1886, with a characteristic preface which might serve as the author's epitaph. "I have written little," it runs; "but it is all my best; I have never spoken when I had nothing to say, nor spared time or labour to make my words true. I have respected posterity; and there should be a posterity which cares for letters, I dare hope that it will respect me." The obvious sincerity which underlies this statement, combined with a certain humour which peeps through its naiveté, points to two of the principal characteristics of Patmore's minor poetry; characteristics which came to be almost unconsciously merged and harmonized as his style and his intention drew together into unity. In the higher flights, to which he arose as his practice in the art grew perfected, he is always noble, and often sublime. His best work is found in the volume of odes called The Unknown Eros, which is full not only of passages but of entire poems in which exalted thought is expressed in poetry of the richest and most dignified melody. The animating spirit of love, moreover, has here deepened and intensified into a crystalline harmony of earthly passion with the love that is divine and transcending; the outward manifestation is regarded as a symbol of a sentiment at once eternal and quintessential. Spirituality informs his inspiration; the poetry is of the finest elements, glowing and alive. The magnificent piece in praise of winter, the solemn and beautiful cadences of "Design," are in the best, in the most elevated paths of "The Toys," are in their various manners unsurpassed in English poetry for sublimity of thought and perfection of expression. Patmore is one of the few Victorian poets of whom it may confidently be predicted that the memory of his greater achievements will outlive all consideration of occasional lapses from taste and dignity. He wrote, at his best, in the grand manner, melody and thought according with perfection of expression, and his finest poems have that indefinable air of the inevitable which is after all the touchstone of the poetic quality. His son, Henry John Patmore (1860–1883), left a number of poems posthumously printed at Mr Daniel's Oxford Press, which show an unmistakable lyrical quality.

CATHERINE BURGESS

PATMORE, an island in the east of the Aegean Sea, one of the group of the Sporades, about 28 m. S.S.W. of Samos, in 35° 20'-N. lat. and 26° 35' E. long. Its greatest length from N. to S. is about 10 m., its greatest breadth 6 m., its circumference, owing to the winding nature of the coast, about 37 m. The island,
which is volcanic, is bare and rocky throughout; the hills, of which the highest rises to about 800 ft., command magnificent views of the neighbouring sea and islands. The skill of the natives as seamen is proverbial in the archipelago. The deeply indented coast, here falling in huge cliffs sheer into the sea, there retiring to form a beach and a harbour, is favourable to commerce, as in former times it was to piracy. Of the numerous bays and harbours the chief is that of Scala, which, running far into the land on the eastern side, divides the island into two nearly equal portions—a northern and a southern. A narrow isthmus separates Scala from the bay of Merika on the west coast. On the belt of land between the two bays, at the junction between the northern and southern half of the island, stood the ancient town. On the hill above are still to be seen the massive remains of the citadel, built partly in polygonal style. The modern town stands on a hill top in the southern half of the island. A steep paved road leads to it in about twenty minutes from the port of Scala. The town clusters at the foot of the monastery of St John, which, crowning the hill with its towers and battlements, resembles a fortress rather than a monastery. Of the 600 MSS. once possessed by the library of the monastery only 240 are left. The houses of the town are better built than those of the neighbouring islands, but the streets are narrow and winds. The population is about 4000. The port of Scala contains about 140 houses, besides some old well-built magazines and some potteries. Scattered over the island are about 300 chapels.

Patmos is mentioned first by Thucydidides (iii. 33) and afterwards by Strabo and Fliny. From an inscription it has been inferred that the name was originally Patmos. Another ancient inscription seems to show that the Ionians settled there at an early date. The chief, indeed the only, title of the island is that of bishop. It is the place of banishment of St John the Evangelist, who, according to Jerome (De scr. ill. c. 9) and others, was exiled thither under Domitian in A.D. 95, and released about eighteen months afterwards under Nerva. Here he is said to have written the Apocalypse; to the left of the road from Scala to the town, about half-way up the hill, a grotto is still shown (το επηναυσι των Αποκαλυψης) in which the apostle is said to have received the heavenly vision. It is reached through a small church dedicated to St Anne. The Acts of St John, attributed to Prochorus, narrates the miracles wrought by the apostle during his stay on the island, but, strangely enough, while describing how the Gospel was revealed to him Patmos it does not so much as mention the Apocalypse. During the dark ages the island seems to have been entirely deserted, probably on account of the pirates. In 1088 the emperor Alexis Comnenus, by a golden bull, which is still preserved, granted the island to St Christodulus for the purpose of founding a monastery. This was the origin of the monastery of St John, which now owns the greater part of the southern half of Patmos, as well as farms in Crete, Samos and other neighbouring islands. The embalmed body of the saintly founder is to be seen to this day in a side chapel of the church. The number of the monks, which amounted to over a hundred at the beginning of the 18th century, is now much reduced. The abbot (ἐπιτυμβον) has the rank of a bishop, and is subject only to the patriarch of Constantinople. There is a school in connection with the monastery, which formerly enjoyed a high reputation in the Levant. The modern town was recruited by refugees from Constantinople in 1453, and from Crete in 1669, when these places fell into the hands of the Turks. The island is subject to Turkey; the governor is the pasha of Rhodes. The population is Greek. The women are chiefly engaged in knitting cotton stockings, which, along with some pottery, form the chief exports of the island.

PATNA, a city, district, and division of British India, in the Behar province of Bengal. The city, which is the most important commercial centre in Bengal after Calcutta, lies on the right bank of the Ganges, a little distance below the confluence of the Sone and the Gogor, and opposite the confluence of the Gandak, with a station on the East Indian railway 332 m. N.W. of Calcutta. Municipal area, 6184 acres. Pop. (1901), 1,34,785. Including the civil station of Bankipur to the west, the city stretches along the river bank for nearly 9 miles. Still farther west is the military cantonment of Dinapur. A government college was founded in 1862. Other educational institutions include the Behar school of engineering organized in 1897.

Patna city has been identified with Pataliputra (the Palibothra of Megasthenes, who came as ambassador from Seleucus Nicator to Chandragupta about 300 B.C.). Megasthenes describes Palibothra as being the capital of India. He adds that its length was 80 stadia, and breadth 15; that it was surrounded by a ditch 30 cubits deep, and that the walls were adorned with 570 towers and 64 gates. According to this account the circumference of the city would be 160 stadia or 235 miles. Asoka built an outer mansion wall and beautified the city with innumerable stone buildings. The greater part of the ancient city still lies buried in the silt of the rivers under Patna and Bankipur at a depth of from 10 to 20 ft. The two events in the modern history of the district are the massacre of Patna (1763) and the Sopy Mutiny in 1857. The former occurrence, which may be said to have settled the fate of Mahomedan rule in Bengal, was the result of a quarrel between the nawab, Mir Kasim, and the English authorities regarding transit duties, which ultimately led to open hostilities. The company’s sepoys, who had occupied Patna city by the orders of the company’s factor, were driven out by the nawab’s troops and nearly all killed. The remainder afterwards surrendered, and were put into confinement, together with the European officers and the entire staff of the Cosimbazar factory, who had also been arrested on the first outbreak of hostilities. Mir Kasim was defeated in two pitched battles at Gheria and Udhana (Oodeynullah) in August and September 1763, and in revenge ordered the massacre of all his prisoners, which was carried out with the help of a renegade in his employment named Walter Reinhardt, (afterwards the husband of the famous Begum Samra). About sixty Englishmen were murdered on this occasion, the bodies being thrown into a well belonging to the house in which they were confined. At the outbreak of the mutiny in May 1857 the three sepoy regiments stationed at Dinapur (the military cantonment of Patna, admiralty) and Patna (the capital city) were ordered to retain districts. On the 10th of May, 1857, in an attempt being made to disarm them, they broke into open revolt. Although many who attempted to cross the Ganges in boats were fired into and run down by a pursuing steamer, the majority crossed by the Ganges boat into Shahabad, where they joined the rebels under Kuar Singh who were then besieging a small European community at Arrah.

The District of Patna has an area of 2075 sq. m.; pop. (1901), 1,624,985. Throughout the greater part of its extent the district is a level plain; but towards the south the ground rises into hills. The soil is for the most part alluvial, and the country along the bank of the Ganges is peculiarly fertile. The general line of drainage is from west to east; and high ground along the south of the Ganges, and the river dividing the district in two, shows that during the rains nearly the whole interior of the district south of a line drawn parallel to the Ganges, and 4 or 5 m. from its bank, is flooded. In the south-east are the Rajgir Hills, consisting of two parallel ridges running south-west, with a narrow valley between, intersected by ravines and passes. These hills, which seldom exceed 1000 ft. in height, are rocky and clothed with thick low jungle, and contain some of the earliest memorials of Indian Buddhism. The chief rivers are the Ganges and the Sone. The only other river of any consequence is the Pulpun, which is chiefly remarkable for the number of petty irrigation canals which it supplies. So much of the river is thus diverted that only a small portion of its water ever reaches the Ganges at Patna. The chief crops are rice, wheat, barley, maize and pulse; poppy and potatoes.

XX. 30
are also of importance. Apart from the Sone canal, irrigation is largely practised from private channels and also from wells. The district is traversed by the main line of the East Indian railway, with two branches south to Gaya and Bihar.

The Division of Patna extended across both sides of the Ganges. It comprised the seven districts of Patna, Gaya, Shahabad, Saran, Champaran, Muzaffarpur and Darbhanga. Total area, 23,748 sq. m.; pop. (1901), 15,514,697. In 1908 the four last districts north of the Ganges were formed into the new division of Tirhut; and the name of Patna division was confined to the three first districts south of the Ganges.

See L. A. Waddell, Discovery of the Exact Site of Asoka's Classic Capital of Pataliputra (1822); Vincent Smith, Asoka ("Rulers of India" series, 1901); Patna District Gazetteer (Calcutta, 1897).

**Patna**, one of the Orissa tributary states in Bengal, with an area of 2309 sq. m. It lies in the basin of the Mahanadi river, and is divided by a forest-clad hilly tract into a northern and a southern portion, both of which are undulating and well cultivated. Pop. (1901), 277,748, showing a decrease of 16% in the decade, mainly due to the effects of famine in 1900. Nearly the whole population consists of Oriyas. The capital is Patna: pop. (1901), 3706 the principal crop is rice. The maharajas of Patna were formerly heads of a group of states known as the *atha gorkiat* or "eighteen forts." They are Chauhan Rajputs, and claim to have been established in Patna for six centuries. Patna was the scene of a rebellion of the Khonds, followed by atrocities on the part of their rulers, in 1869, and, in consequence, came under British management in 1871. The maharaja Ramchandra Singh, installed in 1894, was insane and put an end to his own life in the following year, whereupon his uncle, Lal Dalganj Singh, became chief, undertaking to administer with the assistance of a diwan or minister appointed by the British government. The powers of this official were extended in 1900 after a serious outbreak of dacoity. Till 1905 the state was included in the Central Provinces.

**Patois**, a French term strictly confined to the dialect of a district or locality in a country which has a common literary language, often used of the form of a common language as spoken by illiterate or uneducated persons, marked by vulgarisms in vocabulary, pronunciation, grammar, &c. The origin of the word is not certain. It has been taken to be a corruption of *patris*, from Low Lat. *partiensis*, or of belonging to one's patria, or native country, fatherland.

**Paton, John Brown** (1830–1914), British Nonconformist divine, was born on the 17th of December 1830. He was educated at London, Poole and Spring Hill College, Birmingham; he graduated B.A. at London University in 1849, and was Hebrew and New Testament prizeman in 1850 and gold medallist in philosophy in 1854. He received the honorary degree of doctor of divinity from Glasgow University in 1881. When the Nottingham Congregational Institute was founded in 1863 he became the first principal, a post which he held till 1898, when he was succeeded by James Alexander Mitchell (1846–1913), who from 1903 till his death was general secretary of the Congregational Union. Paton became vice-president of the British and Foreign Bible Society in 1907. He took an active part in the foundation and direction of both British and foreign missions, and in the work of social service for religious and social work, notably the National Home Reading Union Society and English Land Colonization Society, and was a constant contributor to literary reviews. His publications include *The Two-fold Alternative* (3rd ed., 1900), *The Inner Mission of the Church* (new ed., 1900), and two volumes of collected essays. His son, John Lewis Paton (b. 1865), who headed the Cambridge classical tripos in 1886, became head master of Manchester grammar school in 1903.

**Paton, Sir Joseph Noel** (1821–1901), British painter, was born, on the 13th of December 1821, in Woolers Alley, Dunfermline, where his father, a fellow of the Scottish Society of Antiquaries, carried on the trade of a damask manufacturer. He showed strong artistic inclinations in early childhood, but had no regular art training, except a brief period of study in the Royal Academy School in 1843. He gained a prize of £200 in the first Westminster Hall competition, in 1845, for his cartoon "The Spirit of Religion," and in the following year he exhibited at the Royal Scottish Academy his "Quarrel of Oberon and Titania." A companion fairy picture, "The Reconciliation of Oberon and Titania," went to Westminster Hall in 1847, and for it his picture of "Christ bearing the Cross" he was awarded a prize of £500 by the Fine Arts Commissioners. The two Oberon pictures are in the National Gallery of Scotland, where they have long been a centre of attraction. His first exhibited picture, "Ruth Gleaning," appeared at the Royal Scottish Academy in 1844. He began to contribute to the Royal Academy of London in 1856. Throughout his career his preference was for allegorical, fairy and religious subjects. Among his most famous pictures are "The Pursuit of Pleasure" (1853), "Mors Janua Vitae" (1866), "Osokold and the Elf-maidens" (1874), and "In Die Malo" (1882). Sir Noel Paton also produced a certain amount of sculpture, more notable for design than for searching execution. He was elected an associate of the Royal Scottish Academy in 1847, and a full member in 1890; of the Royal Academy of Art in London in 1866, and received knighthood in 1867. In 1882, in Edinburgh, he was invested as a Knight of the Thistle. Sir Noel Paton died in London on the 26th of December 1901. His eldest son, Diarmid Noel Paton (b. 1859), became regius professor of physiology in Glasgow in 1906; and another son, Frederick Noel Paton (b. 1861), became in 1905 director of commercial intelligence to the government of India.

**Patras** (Gr. Πατρας), the chief fortified seaport town on the west coast of Greece, and chief town of the province of Achaea and Elis, on a gulf of the same name, 70 m. W.W.N. of Corinth. There are two railway stations, one in the north-east on the line to Athens (via Corinth), the other on the line to Pyrgos. Pop. (1896), 33,529; (1905), 37,401. It has been rebuilt since 1821 (the War of Independence), and is the seat of a Greek archbishop and an appeal court. It is the chief port of Greece, from which the great bulk of its cargoes are despatched. The port, formed by a mole and a breakwater, begun in 1880, offers a fair harbour for vessels drawing up to 22 ft. The exports consist of currants, sultanas, valonea, tobacco, olive oils, olives in brine, figs, citrous, wine, brandy, cocoons, and lamb, goat, and kid skins. The imports consist chiefly of colonial produce, manufactured goods and sulphate of copper. The two most interesting buildings are the castle, a medieval structure on the site of the ancient acropolis, and the cathedral of St Andrew, which is highly popular as the reputed burial-place of the saint.

The foundation of Patras goes back to prehistoric times, the legendary account being that Eumelas, having been taught by Triptolemus how to grow grain in the rich soil of the Achæan valley, established three townships, Aroe (i.e. ploughland), Antheia (the flowerery), and Mesatis (the middle settlement), which were united by the common worship of Artemis Tricalia and Apollo Meleagris. The Achæans having strengthened and enlarged Aroe, called it Patrae, as the exclusive residence of the ruling families, and it was recognized as one of the twelve Achæan cities. In 419 B.C. the town was, by the advice of Alcibiades, connected with its harbour by long walls in imitation of those at Athens. The whole armed force was destroyed by Metellus after the defeat of the Achæans at Scarphea, and many of the remaining inhabitants forsook the city; but after the battle of Actium Augustus restored the ancient name Aroe, introduced a military colony of veterans from the 10th and 12th legions (not, as is usually said, the 22nd), and bestowed the rights of coloni on the inhabitants of Rhypae and Dyne, and all the Locri Ozieae except those of Amphissa. Colonia Augusta Aroe Patretria became one of the most populous of all the towns of Greece; its colonial coinage extends
Patriarch—Patricians

from Augustus to Gordian III. That the town was the scene of the martyrdom of St Andrew is purely apocryphal, but, like Corinth, it was an early and effective centre of Christianity: its archbishop is mentioned in the lists of the Council of Sardica in 347. In 551 it was laid in ruins by an earthquake. In 807 it was able without external assistance to defeat the Slavonians (Avars), though most of the credit of the victory was assigned to St Andrew, whose church was enriched by the imperial share of the spoils, and whose archbishop was made superior of the bishops of Methone, Lacedaemon and Corone. Captured in 1205 by William of Champlitte and Villehardouin, the city became the capital and its archbishop the primate of the principality of Achaea. In 1387 De Heredia, grand master of the Order of the Hospital at Rhodes, endeavoured to make himself master of the city and took Patras by storm. At the close of the 15th century the city was governed by the archbishop in the name of the pope; but in 1428 Constantine, son of John VI., managed to get possession of it for a time. Patras was at length, in 1687, surrendered by the Turks to the Venetians, who made it the seat of one of the seven fiscal boards into which they divided the Morea. In 1714 it again fell, with the rest of the Morea, into Turkish hands. It was at Patras that the Greek revolution began in 1821, but the Turks, confined to the citadel, held out till 1828.

Patriarch (M.E. and O. Fr. patriarche, Lat. patriarca, Gr. πατριάρχης, from πατέρα, clan, and ἀρχή, rule), originally the father or chief of a tribe, in this sense now used more especially of the Greek and the Old Orient bishops, and took Patras by storm. The patricians of the family and the clan by the unprivileged class would be perfectly natural.

The absurdity of excluding the plebeians from all but a merely theoretical citizenship, based on the negative fact of freedom, seems to have become apparent before the close of the monarchical period. The aim of the reforms associated with the name of Servius Tullius appears to have been the imposition of the duties of citizenship upon the plebeians. Incidentally this involved an extension of plebeian privilege in two directions. First, it was necessary to unify the plebeian order by putting the legal status of the clients on a level with that of the unattached plebeians; and again enrolment in the army involved registration in the tribes and centuries; and as the army soon developed into a legislative assembly meeting in centuries (comitia centuriata), the whole citizen body, including plebeians, now acquired a share of political power, which had hitherto belonged solely to the patricians. At the close of the monarchy, the plebeians possessed the private rights of citizenship in entirety, except for his inability to contract a legal marriage with a patrician, and one of the public rights, that of giving his vote in the assembly. But in the matter of liability to the duties of public citizens, plebeians and patricians still held on a level with the patrician. The position was probably tolerable during the monarchy, when the king served to hold the power of the patrician families in check. But when these families had expelled the Tarquins, and formed themselves into an exclusive aristocracy of privilege, the inconsistency between partial privilege and full burdens came to be strongly felt by the plebeians.

The result was the long struggle for entire political equality of the two orders which occupies the first few centuries of the republic (see Rome: History, § II. “The Republic”). The struggle was inaugurated by the plebeians, who in 494 B.C. formed themselves into an exclusive order with annually elected officers (tribuni plebis) and an assembly of their own, and by means of this machinery forced themselves by degrees into all the magistracies, and obtained the coveted right of intermarriage with the patricians. Admission to the higher magistracies carried with it admission to the senate, and by the close of the struggle (about 300 B.C.) the political privilege of the two orders was virtually limited to the exception of certain dignities which, originally devised to break the political monopoly of the orders, continued to be attached to the patricians after the victory of the plebs. They were excluded from the tribunate and the council of the plebs, which had become important instruments of government, and were only eligible for one place in the consulship and censorship, while both were open to plebeians. It is possible, though far from certain (see Senate), that the powers of the interregnum and the senatorial confirmation (patrum auctoritas) necessary to give validity to decisions of the people, remained the exclusive privileges of the patrician members of the senate. But while the patrician disabilities were of a kind that had gained in importance with the lapse of centuries, these privileges, even if still retained, had become merely formal in the second half of the republican period. Since the plebeian element in the state had an immense numerical preponderance over the patrician these disabilities were not widely spread, and seem generally to have been cheerfully borne as the price of belonging to the families still recognized as the oldest and noblest in Rome. But the adoption of P. Claudius Pulcher into a plebeian family in 59 B.C. with a view to election to the tribunate shows that a rejection of patrician rights (transitio ad plebes) was not difficult to effect by any patrician who preferred actual power to the dignity of ancient descent. It was not so easy to recruit the ranks of the patricians. The traditions of early Rome indeed represent the plebeians as receiving the Claudii by a collective act into their body; but the first authenticated instance of the admission of new members to the patriciate is that of the lex Cassia, which authorized Caesar as dictator to create fresh patricians. The same procedure was followed by Augustus. Later on, the right of creating patricians came to be regarded as inherent in the princeps, and was exercised by Claudius and Vespasian without any legal enactment, apparently in their capacity as censor (Tac. Ann. xi. 25; Viti M. Antonini, l.). Patrician rank seems to have been regarded as a necessary attribute of the princeps; and in two cases we are told that it was conferred upon a plebeian princeps by the senate (Viti Juliani, 3; Macrini, 7). A comparison of this procedure with the original conception of the patriciate as revealed by the derivation of the word, is significant of the history of the conception of nobility at Rome, and illustrative of the tenacity with which the Romans clung to the name and form of an institution which had long lost its significance. After the political equalization of the two orders, noble birth was no longer recognized as constituting a claim to political privilege. Instead of the old hereditary nobility, consisting of the members of the patrician clans, there arose a nobility of office, consisting of all those families, whether patrician or plebeian, which had held curule office. It was now the tenure of office that conferred distinction. In the early days of Rome, office was only open to the member of a patrician gens. In the generals of patrician rank, who were dismissed upon the earlier state of affairs, was held to be a dignity suitable to be conferred on an individual holder of office. But the confinement of the rank upon an individual as distinct from a whole family (gens) is enough to show how widely the modern conception of patrician rank differed from the ancient. The explanation of this is that the plebeians had long been organized, like the patricians, in gentes, and nothing remained distinctive of the old nobility except a vague sense of dignity and worth.

(A.M.C.L.)

II. Under Constantine an entirely new meaning was given to the word Patrician. It was used as a personal title of honour conferred for distinguished services. It was a title merely of rank, not of office; its holder ranked next after the emperor and the consul. It naturally happened, however, that the title was generally bestowed upon officials, especially on the chief provincial governors, and even among barbarian chieftains whose friendship was valuable enough to call forth the imperial benediction. Among the former it appears to have become a means of increasing the gens title of the Byzantine viceregents of Italy, the exarchs of Ravenna; among the barbarian chiefs who were thus dignified were Odoacer, Theodoric, Sigismund of Burgundy, Clovis, and even in later days princes of Bulgaria, the Saracen, and the West Saxons. The word thus acquired an official connotation. The dignity was not hereditary and belonged only to individuals; thus a patrician family was merely one whose head enjoyed the rank of patricius. Gradually the root sense of “father” came to the front again, and the patricius was regarded as the “father of the emperor” (Ammian Marc. xxix. 2). With the word were associated such further titles as eminencia, magnitudo, magnificientia. Those patricians who were purely honorary were called honorarii or codicillarii; those who were still in harness were praesentales. They were all distinguished by a special dress or uniform and in public always drove in a carriage. The emperor Zeno enacted that no one could become patricius who had not been projectus miltium, consul or magister militem, but less careful emperors gave the title to their favourites, however young and undistinguished. The right in which the title was conferred was called a diploma.

A further change in the meaning of the word was marked by its conferring on Pippin the Frank by Pope Stephen. The idea of this extension originated no doubt in the fact that the Italian patricius of the 6th and 7th centuries had come to be regarded as the defender, protector, patronus of the Church. At all events, the conferring of the title by a pope was entirely unprecedented; previously its validity had depended on the emperor solely. As a matter of fact it is clear that the patriciate of Pippin was a new office, especially as the title is henceforward generally patricius Romanorum, not patricius alone. It was

1 Cf. the privileges of the Athenians under the Solonian system see Solon; Ecclesia; Archon.

2 The name is used of Charles Martel, but it was not apparently formally conferred upon him.
subsequently conferred on Charlemagne at his coronation, and borne, as we gather from medieval documents, indiscriminately, not only by subsequent emperors, but also by lesser line of Burgundian rulers and minor princes of the middle ages generally. On the fall of the Carolingian house the title passed to Alberic II. Subsequently it was held by John Crescentius, and many leading men who received it from Otto III. (e.g. Boleslaw Chrobry of Poland). In 1046 it returned to the German Henry III. The emperor Frederick Barbarossa was the last to wear the insignia (in 1167).

PATRICK, ST., the patron saint of Ireland, was probably born about the year 389. He was the son of a deacon, Calpurnius, and the grandson of a presbyter named Potitus. His father was a middle-class landed proprietor and a deacon, who is represented as living at a place called Bannaunanta. The only place of this name we know is Daventry, but it seems more probable that Patrick’s home is to be sought near the Severn, and Rhys conjectures that one of those three places called Banwen in Glamorgan-shire may be intended. The British name of the future apostle was Sucat, to which Mod. Welsh added “warlike” correspondence. His Roman name has also survived in a hibernicized form, Cothryg, with the common substitution of Irish c for Brythonic p (cf. Irish case, Lat. pascha). Patrick was doubtless educated as a Christian and was imbued with reverence for the Roman Empire. When about sixteen years of age he was carried off by a band of Irish marauders. The latter were possibly taking part in the raid of the Irish king Niall Noigiallach, who met with his end in Britain in 409. Irish tradition represents the future apostle as tending the herds of a chieftain of the name of Milucc (Milchu), near the mountain called Slemish in county Antrim, but Bury tries to show that the scene of his captivity was Connaught, perhaps in the neighbourhood of Croagh Patrick. His bondage lasted for six years. During this time he became subject to religious emotion and beheld visions which encouraged him to effect his escape. He fled, in all probability to the coast of Wicklow, and encountered a vessel which was engaged in the slave trade, and expected to carry over to Gaul a party of Irish traders landed, possibly on the west coast of Gaul, and journeyed for twenty-eight days through a desert. At the end of two months Patrick parted from his companions and betook himself to the monastery of Lérins, where he probably spent a few years. On leaving the Mediterranean region he seems to have returned home. It was doubtless during this stay in Britain that the idea of missionary enterprise in Ireland came to him. In a dream he saw a man named Victorious bearing innumerable epistles, one of which he received and read; the beginning of it contained the words “The Voice of the Irish”; whilst repeating these words he says, “I imagined that I heard in my mind the voice of those who were near the wood of Fochl (Fochlad), which is near the western sea, and thus they cried: We pray thee, holy youth, to come and walk again amongst us as before.” The forest of Fochlad was in the neighbourhood of Killala Bay, but it is possible that it extended considerably to the south. Despite his natural diffidence, and opposition on the part of his relatives, Patrick resolved to return to Gaul in order to prepare himself for his mission. He proceeded to Auxerre—a place which seems to have had a close connexion with Britain and Ireland—and was ordained deacon by Bishop Amator, along with two others who were afterwards associated with him in spreading the faith in Ireland. The one was an Irishman called Fith, better known as Iscininus, the other Auxilus. Patrick must have spent at least fourteen years at Auxerre.

It seems not unlikely that Pelagianism had taken root among the Christian communities of Ireland, and it was found necessary to send a bishop to combat the heresy. Pope Celestine’s choice fell on the deacon Palladius, who had taken a prominent part in stamping out the doctrine in Britain. The mission of Palladius (437-432), whom Zimmer has endeavoured to identify with Patrick, is obscure. Tradition associates his name with the mountains of Wicklow, and we are told that he retired to the land of the Picts in North Britain, where he died. Patrick probably felt great disappointment when Palladius was sent as the chosen envoy of Rome, but now Germanus seems to have decided that Patrick was the man for the task, and he was consecrated in 432. For the peculiar social conditions with which the Christian missionary would be confronted in Ireland see BREHON LAWS and IRELAND: Early History. Suffice it to say here that the land belonged to the tribes, and that the success of Patrick’s undertaking depended entirely on his ability to gain the goodwill of the tribal kings and chiefs of clans. We are totally ignorant as to the extent and number of the pre-Patrician Christian communities in Ireland. It seems probable that they were, largely, if not wholly confined to the south-east of the island. Patrick landed at Inverada, the mouth of the river Vartry in Wicklow, but we are not informed as to any of his doings in Leinster at this period. According to the story, he immediately proceeded northward to the kingdom of Ulidia (east Ulster), and through a certain trial represents himself as going to Meath. Landing on the shores of Strangford Lough, he commenced his labours in the plain on the south-west side of that inlet. A convert chief named Dichu granted him a site for an establishment, and a wooden barn is stated to have been utilized for the purpose of worship, whence the modern Saul (Ir. saball), “ barn.” Patrick’s activity was bound to bring him sooner or later into conflict with the High-king Loigaire (reigned 428-467), son of Niall Noigiallach. Fedlimid, a brother of the monarch, is represented as having made over his estate at Trim to the saint to found a church, and thus the faith was established within Loigaire’s territory. The story in picturesquely fashion makes Patrick challenge the royal authority by lighting the Paschal fire on the hill of Slane on the night of Easter Eve. It chanced to be the occasion of a pagan festival at Tara, during which no fire might be kindled until the royal fire had been lit. A number of trials of skill between the Christian missionary and Loigaire’s Diarmait mac Ruaidri (not), and the final result seems to have been that the monarch, though unwilling to embrace the foreign creed, undertook to protect the Christian bishop. At a later date the saint was probably invited by Loigaire to take part in the codification of the Senchas Mor in order to represent the interests of the Christian communities. On another occasion Patrick is reported to have overthrown a famous idol known as Cenn Cruisach or Crem Cruach in the plain of Mag Slecht (county Cavan). Several churches seem to have been founded in the kingdom of Meath by the saint, but they cannot now be identified. Patrick is stated to have visited Connaught on three different occasions and to have founded churches, one of the most important being that at Elphin. As regards Ulster our information is very scanty, though we find him establishing churches in the three kingdoms of the province (Ailech, Oriel and Ulidia). Patrick’s work is more closely identified with the north of Ireland than with the south. Places of his mission, however, are to be found in Osory and Muskerry. But his task in the south was doubtless rather that of an organizer, and a kind of circular letter has come down to us which was addressed by Patrick, Auxilus and Iscininus, to all the clergy of the island. There is some

---

1 We even find a feminine form, *patricissa*, for the wife of a *patricius*. The golden cincture worn on the head by the *patricius* as a symbol of his dignity was called a *patricidius* cinctus.

2 His career is involved in considerable obscurity. Widely varying views have been held by modern scholars with regard to his activity, some going so far as to treat all the accounts of his labours as the fictitious production of a later age. In the present article Bury's reconstruction of the saint's life has been chiefly followed. Apart from its importance in other respects, Bury's treatment of the subject has at any rate the merit of defending the traditional view of St. Patrick's career.
evidence that he made a journey to Rome (441–443) and brought back with him valuable relics. On his return he founded the church and monastery of Armagh, the site of which was granted by Diarmait, king of Oriel, and it is accounted to him by Irish historians, specially connected with the supreme ecclesiastical authority. Some years before his death, which took place in 461, Patrick resigned his position as bishop of Armagh to his disciple Benignus, and possibly retired to Saul in Dalaradda, where he spent the remainder of his life. The place of his burial was a matter of dispute in early Ireland, but it seems most likely that he was interred at Saul.

Two highly important documents purporting to have been written by Patrick have come down to us. Although the genuineness of these writings has been impugned on various occasions by different scholars, there seems to be no reason for assuming that they did not emanate from the saint's pen. The one is the Confession, which is contained in an imperfect state in the Book of Armagh (c. 857), but complete copies are found in later MSS. The Confession, written towards the end of his life, gives a general account of his career. Various charges had been brought against him by his enemies, among them that of illiteracy, the truth of which is borne out by the crudeness of his style, and is fully admitted by himself in the written evidence. Before being admitted to the deacon's orders he had communicated to a friend some fault which he had committed when about fifteen years of age. This friend had not considered it an obstacle to ordination. Later the secret was betrayed and came to the ears of persons who, as he says, "urged my sins against my laborious episcopate." It is impossible to ascertain who these detractors were—perhaps British fellow-workers in Ireland. The other document is the so-called Letter to Coroticus. The soldiers of Coroticus (Ceretic), a British king of Strathclyde, had in the course of a raid in Ireland killed a number of Christian neophytes on the very day of their baptism while still clad in white garments. Others had been carried off into slavery, and a deputation of clergy which Patrick had sent to ask for their release had been subjected to ridicule. In his Letter the saint in very strong language urges the Christian subjects of the British king not to have any dealings with their ruler and his bloodthirsty followers until full satisfaction should have been made. The text of this letter occurs in a number of MSS. but is not contained in the Book of Armagh. It is a work of a character that it was known in the 7th century. A strange barbaric chant commonly known as the Lorica or Hymn of St Patrick is preserved in the Liber hymnorum. This piece, called in Irish the Faoi Fiada or the Cry of the Deer, contains a number of remarkable grammatical forms, and the latest editors are of opinion that it may very well be genuine. From such slender material it is not easy to form a clear conception of the saint's personality. His was evidently an intensely spiritual nature, and in addition to the qualities which go to form a strong man of action he must have possessed an enthusiasm which enabled him to surmount all difficulties. His importance in the history of Ireland and the Irish Church consists in the fact that he brought Ireland into touch with western Europe and more particularly with Rome, and that he introduced Latin into Ireland as the language of the Church. His work consisted largely in organizing the Christian societies which he found in existence on his arrival, and in planting the faith in regions such as the extreme west of Connaught which had not yet come under the sway of the gospel.

Authorities.—Apart from the Letter and Epistle mentioned above our chief sources of information with regard to the life of St Patrick are contained in the Book of Armagh. The one is the Biographical Notices which are part of the bishop's own narrative, and the other is the Life of the Bishop Urban of Armbracan in Meath (d. 657). The first part of this work, which was probably compiled about 670, deals with the saint's work in Meath, the second with his activity in Connaught. Various additions are appended to this compilation, and there are still further additional notes. The other biography was written towards the end of the 7th century by Muirchut Macc Muachtcheni, who dedicated his work to Bishop Aid of Slieve (d. 700). The first portion deals with Patrick's career down to his arrival in Ireland and contains an unvarnished statement of fact. But when the story passes to Ireland Muirchut's narrative becomes full of the mythical element. The influence of Muirchu's work can be traced in all later biographies. Bury has shown that both Tirescian and Muirchu drew from written material which existed in part at any rate in Irish. Among later lives we may mention the hymn Genam Patriciac, composed about 978, and the Life of St Patrick 1262, attributed to John of Monte Corvino, which is supposed to have been originally composed about 800. Three anonymous Latin lives were published by Colgan in his Trias Thaumaturga (Louvain, 1645), and there exists an 11th-century Irish life in three volumes, written by B. de Boligo, Bishop of Kildare (d. 1002). A Latin translation of a different copy of this work, now lost, was published by Colgan. Lastly a life by an otherwise unknown Irish writer named Probus occurs in the Basel edition of Bede's works (1563) and was reprinted by Colgan.

PATRICK, SIMON (1626–1707), English divine, was born at Gainsborough, Lincolnshire, on the 8th of September 1626. He entered Queen's College, Cambridge, in 1644, and after taking orders in 1651 became successively chaplain to Sir Walter St John and vicar of Battersea, Surrey. He was afterwards (1662) preferred to the rectory of St Paul's, Covent Garden, where he continued to labour during the plague. He was appointed dean of Peterborough in 1679, and bishop of Chichester in 1689, in which year he was employed, along with others of the new bishops, to settle the affairs of the Church in Ireland. In 1691 he was translated to the see of Ely, which he held until his death on the 31st of May 1707. His sermons and devotional writings, which are very numerous, were long held in high estimation, and his Commentary on the Historical and Poetical Books of the Old Testament, in 10 vols., brought down as far as the Song of Solomon, was reprinted as recently as 1853. His Friendly Debate between a Conformist and a Nonconformist was a controversial tract which excited considerable feeling at the time of its publication in 1668, but he lived long enough to soothe his enemies and conduct the exasperation it had caused. He also contributed to a volume of Poems upon Divine and Moral Subjects (1713).

The first collected edition of his works appeared at Oxford in 1859 (6 vols., 8vo); a small Autobiography was published also at Oxford in 1859.

PATRIZZI, FRANCESCO (FRANCISCUS PATRITIUS) (1529–1597), Italian philosopher and scientist, was born at Clissa, in Dalmatia, and died in Rome. He gained the patronage of the bishop of Cyprin, who brought him to Venice, where his abilities were immediately recognized by his appointment to the chair of philosophy at Ferrara. He was subsequently invited to Rome by Clement VIII. In spite of his almost incessant controversies with the Aristotelians, he found time to make a comprehensive study of contemporary science. He published in 15 books a treatise on the New Geometry (1587), and works on history, rhetoric and the art of war. He studied ancient theories of music, and is said to have invented the thirteenth-syllable verse known subsequently as versi martelliani. In his philosophy he was mainly concerned to defend Plato against the followers of Aristotle.

His two great works, Discussionum periaptetorum libri XV. (Basel, 1587), and Nota de universis philosophia (Basel, 1591), developed the view that, whereas Aristotle's teaching was an indirect opposition to Christianity, Plato, on the contrary, foreshadowed the Christian revelation and prepared the way for its acceptance. In the earlier treatise he attacks the life and character of Aristotle, and ingeniously attempts to refute his doctrines from a theological standpoint. In the second and greater work he goes back to the theories and methods of the Ionians and the pre-Socratics generally. His theory of the universe is that, from God there emanates a light which extends throughout all space and time and is the explanation of all development. This Light is not corporeal and yet is the fundamental reality of things. From Light came Heat and Fluidity; these three together with Space make up the elements out of which all things are constructed. This cosmic theory is a curious combination of materialistic and abstract ideas; the influence of his master Telesio (q.v.), generally predominant,
PATROCLÉS—PATRON AND CLIENT

is not strong enough to overcome his inherent disbelief in the adequacy of purely scientific explanation.

**PATROCLÉS** (c. 312–261 B.C.), a Macedonian general and writer on geographical subjects, who lived during the reigns of Seleucus I and Antiochus I. When in command of the fleet of Seleucus (285) he undertook a voyage of exploration on the Caspian Sea to discover possible trade routes, especially for communication with the peoples of northern India. He came to the conclusion that the Caspian was a gulf or inlet, and that it was possible to enter it by sea from the Indian Ocean. The only information as to his work (even the title is unknown) is derived from Strabo. After the death of Seleucus, Patroclus was sent by his successor Antiochus to put down a revolt in Asia Minor, and lost his life in an engagement with the Sibthorians. Serv. Str., xvi. 589; Diod. Sic., xiii. 100; Plutarch, Demetrius, 47; Pliny, Nat. Hist., vi. 21; Photius, cod. (on Memnon); C. W. Müller, Fragmenta historiorum græcorum, ii. 442; E. H. Bunbury, Hist. of Ancient Geography, vol. i. (1879); W. W. Tarn, "Patrocles and the Okeanis Trade Route" in *Journal of Hellenic Studies*, vol. xxii. (1901).

**PATROL** (Fr. *patrouiller*, connected with *patte*, foot), a verb meaning to move up and down or traverse a specified "round" or "beat" in a district in a town, camp or other place, or on a stretch of water on a river or sea, for the purpose of watching and protecting the same, or for reconnoitring the numbers or positions of an enemy. As a substantive the term is used of the detachment of troops or police employed.

**PATRON,** a word of which the various meanings in European languages are derived and transferred from that of the Lat. *patronus*, whose position in Roman law and antiquities is treated below (**PATRON AND CLIENT**). The most general application of the word in these transferred senses is that of an influential supporter or protector. The earliest use of the word in English appears to have been in the special ecclesiastical sense of the holder of an advowson, the right of presentation to a benefice. From this meaning is deduced that of the person in whom lies the right of presenting to public offices, privileges, &c., still surviving in the title of the Patronage Secretary of the Treasury in Great Britain. From the earliest Christian times the saints took the place of the pagan tutelary deities (*Di tutelares*) and were in this capacity called *tutelares* or *patroni*, patron-saints. To them churches and other sacred buildings are dedicated, and they are regarded as the protectors and guardians of countries, towns, professions, trades and the like. Further, a person may have a patron-saint, usually the one on or near whose festival he has been born, or whose name has been taken in baptism.

A full list of saints, with the objects of the peculiar patronage of each, is given by L. C. Wallis in *his* *Sacrae Theologia* (1868).

**PATRON AND CLIENT** (Lat. *patronus*, from *pater*, father; *clientes* or *clientes*, from *clueare*, to obey), in Roman law. Clientage appears to have been an institution of most of the Graeco-Italian peoples in early stages of their history; but it is in Rome that we can most easily trace its origin, progress and decay. Until the reforms of Servius Tullius, the only citizens proper were the members of the patrician and gentle houses; they alone could participate in the solemnities of the national religion, take part in the government and defence of the state, contract quittance marriage, hold property, and enjoy the protection of the laws. But alongside of them was a gradually increasing non-citizen population composed partly of slaves, partly of free-men, who were nevertheless not admitted to burgess rights. To the latter class belonged the clients, individuals who had attached themselves in a position of dependence to the heads of patrician houses as their patrons, in order thereby to secure attachment to a *gens*, which would involve a *de facto* freedom. Mommsen held that the *plebs* consisted originally of clients only; but the earliest records of Rome reveal the possibility of a man becoming a plebeian member of the Roman state without assuming the dependent position of clientship (see **PATRICIANS**); and long before the time of Servius Tullius the clients must be regarded as a section only of the plebeian order, which also contained members unattached to any *patronus*. The relationship of patron and client was ordinarily created by what, from the client's point of view, was called *adopcionem ad patronum*, from that of the patron, *susceptio clientis*—the client being either a person who had come to Rome as an exile, who had passed through the asylum, or who had belonged to a state which Rome had overthrown. According to Dionysius and Plutarch, it was one of the early cares of Romulus to regulate the relationship, which, by their account of it, was esteemed a very intimate one, imposing upon the patron duties only less sacred than those he owed to his children and his ward, more urgent than any he could be called upon to perform towards his kinsmen, and whose neglect entailed the penalty of death (Tellumoni socer esto). He was bound to provide his client with the necessaries of life; and it was a common practice to make him a grant during pleasure of a small plot of land to cultivate on his own account. Further, he had to advise him in all his affairs; to represent him in any transactions with third parties in which, as a non-citizen, he could not act with effect; and, above all things, to stand by him, or rather be his institute, in any litigation in which he might become involved. The client in return had not only generally to render his patron the respect and obedience due by a dependant, but, when he was in a position to do so and the circumstances of the patron required it, to render him pecuniary assistance. As time advanced and clients amassed wealth, we find this duty insisted upon in a great variety of forms, as in contributions towards the dowries of a patron's daughters, towards the ransom of a patron or any of his family who had been taken captive, towards the payment of penalties or fines imposed upon a patron, even towards his maintenance when he had become reduced to poverty. Neither might give evidence against the other—a rule we find still in observance well on in the 1st century B.C., when C. Herennius declined to be a witness against C. Mercurian on the ground that the family of the latter had for generations been clients of the Herennii (Plut., Mar. 5). The client was regarded as a minor member (*gentilicus*) of his patron's *gens*; he was entitled to assist in its religious services, and bound to contribute to the cost of them; he had to follow his patron to battle on the order of the *gens*; he was subject to its jurisdiction and discipline, and was entitled to burial in its common sepulchre. And this was the condition, not only of the client who personally had attached himself to a patron, but that also of his descendants; the patronage and the clientage were alike hereditary. The same relationship was held to exist between a freedman and his former owner; for originally a slave did not on enfranchisement become a citizen; it was a *de facto* freedom merely that he enjoyed; his old owner was always called his patron, while he and his descendants were substantially in the position of clients, and often designated.

In the two hundred years that elapsed before the Servian constitutional reforms, the numerical strength of the clients, whether in that condition by *adpiscia*, enfranchisement or descent, must have become considerable; and it was from time to time augmented by the retainers of distinguished immigrants admitted into the ranks of the patriciate. There seems also to have been during this period a gradual growth of virtual independence on the part of the clients, and it is probable that their precarious tenure of the soil had in many cases come to be practically regarded as ownership, when a patron had not asserted his right for generations. The exact nature of the privileges conferred on the clients by Servius Tullius is not known. Probably this king guaranteed to the whole plebeian order, including the clients, the legal right of private ownership of Roman land. At the same time he imposed upon the whole order the duty of serving in the army, which was now organized on a basis of wealth. The client had previously been liable to military service at the command of the *gens*. Now he was called upon to take his part in it as a member of the state. As a natural corollary to this, all the plebeians seem to have been enrolled in the tribes, and after the institution of the plebeian assembly (*concilium plebis*) the clients, who formed a large part of the order, secured a political influence which steadily increased. It is not certain how soon they acquired the right to litigate in person on their own behalf, but their possession of this right...
seems to be implied in the XII. Tables, and may have been granted them at an earlier date. At any rate after 449 B.C. there were no disabilities in private law involved in their status. The relation of patron and client, it is true, still remained; the patron could still exact from his client respect, obedience and service, and he and his gens had still an eventual right of succession to a deceased client's estate. But the fiduciary duties of the patron were greatly relaxed, and practically little more was expected of him than that he should continue to give his client his advice, and prevent him falling into a condition of indigence; sacer esto ceased to be the penalty of protection denied or withheld, its application being limited to fratria facta, which in the language of the Tables meant positive injury inflicted or damage done.

So matters remained during the 4th, 3rd and 2nd centuries. In the 2nd and 1st a variety of events contributed still further to modify the relationship. The capacity of patrons was checked by the lex Cinia (passed by M. Cincius Alimentus, tribune in 204 B.C.), which prohibited patron taking gifts of money from their clients; marriages between patron and client gradually ceased to be regarded as unlawful, or as ineffectual to secure to the issue the status of the patron father. At the same time the remaining political disabilities of the clients were removed by their enrolment in all the tribes instead of only the four city tribes, and their admission to the magistracy and the senate. Hereditary clientage ceased when a client attained to a curule dignity; and in the case of the descendants of freedmen enfranchised in solemn forms it came to be limited to the first generation. Gradually but steadily one feature after another of the old institution disappeared, till by the end of the 1st century it had resolved itself into the limited relationship between patron and freedman on the one hand, and the unlimited honorary relationship between the patron who gave gratuitous advice on questions of law and those who came to consult him on the other. To be a patron of these was a matter of ambition to every man of mark in the end of the republic; it increased his importance, and ensured him a band of zealous agents in his political schemes. But amid the rivalries of parties and with the venality of the lower orders, baser methods had to be resorted to in order to maintain a patron's influence; the favour and support of his clients had to be purchased with something more substantial than mere advice. And so arose that wretched and degrading clientage of the early empire, of which Martial, who was not ashamed to confess himself a first-rate specimen of the breed, has given us such graphic descriptions; gatherings of idlers, syphons and spendthrifts, at the levees and public appearances of those whom, in their fawning servility, they addressed as lords and masters, but whom they abused behind their backs as close-fisted upstarts—and all for the sake of the sporula, the daily dole of a dinner, or of a few pence wherewith to procure one. With the middle empire this disappeared. Reference to patron and client occurs in later times it is in the sense of counsel and client, the words patron and advocate being used almost synonymously. It was not so in the days of the great forensic orators. The word advocate, it is said, occurs only once in the singular in the pages of Cicero. But at a later period, when the bar had become a profession, and the qualifications, admission, numbers and fees of counsel had become a matter of state regulation, advocati was the word usually employed to designate thepleaders as a class of professional men, each individual advocate, however, being still spoken of as patron in reference to the litigant with whose interest he was entrusted. It is in this limited connexion that patron and client come under our notice in the latest manuscripts of Roman Law.

**PATTEN, PATTESON**

*PATTEN (adapted from Fr. pâtin, in modern usage meaning a "skate", Mod. Lat. patinus, Ital. patino, of unknown origin; cf. pate, paw), a kind of shoe which, varying in form at different times and places, raised the wearer from the ground in order to keep the feet out of mud or wet. Pattens were necessary to women of all classes in the uncleared and unpaved streets of the 16th, 17th and 18th centuries. They may still be found in use in rural parts of England. A wooden shoe or clog, a light strapped shoe with a very thick sole of wood or cork, and, more particularly, an iron ring supporting at a little distance from the ground a wooden sole with a strap through which the foot slips, have all been types which the patten has taken. An extraordinary kind of "patten" was fashionable in Italy and Spain in the 17th and 12 centuries. This was the *chopine*, a loose slipper resting on a very thick sole of cork or wood. During the 17th century at Venice ladies wore "chopines" of exaggerated size. Coryat, in his * Crudities*, 1611 (vol. 1. p. 400, ed. 1903), gives a description of these Venetian "chapinesy." They were of wood covered with red, white and yellow leather, some gilt or painted, and reached a height sometimes of half a yard. Ladies wearing these exaggerated chopines had to be accompanied by attendants, and were protected from other people by a pole. A 16th century Venetian "chopine" is in the British Museum. The "Patten-makers" Company is one of the minor Livery companies of London. The patten-makers were originally joined with the "Pouch and Galoche Makers," and are mentioned as early as 1400. They became a separate fraternity in 1460, but did not obtain a charter till 1670."

*PATTER*, properly a slang word for the secret or "cant" language used by beggars, thieves, gipsies, &c., hence the fluent plausible talk that a cheap-jack employs to pass off his goods, or a conjuror to cover up his tricks. It is thus used of any rapid manner of talking, and of a "patter-song," in which a very large number of words have to be sung at high speed to fit them to the music. The word, though in some of its senses affected by "patter," to make a series of rapid strokes or pants, as of raindrops, is derived from the quick, mechanical repetition of the *patter*, or London accent.

**PATTERN, model, that which serves as an original from which similar objects may be made, or as an example or specimen; in particular an artistic design serving as a sample or model, hence the arrangement or grouping of lines, figures, &c., which make up such a design. The word was taken from Fr. *patron*, Lat. *patronus*, a defender or protector. In medieval Latin *patronus* had the specific meaning of example, and in modern French both meanings of patron and pattern attach to *patron*. "Patron" in the sense of copy, example, began to be pronounced and spelled in English as "pattern" in the 16th century.

**PATTESON, JOHN COLERIDGE** (1827-1871), English missionary, bishop of Melanesia, was born in London on the 1st of April 1827, the eldest son of Sir John Patteson, justice of the King's Bench, and Frances Duke Coleridge, a near relative of Samuel Taylor Coleridge. He was educated at Ottery St Mary and at Eton, where he trained himself on the cricket-field. He entered Balliol College, Oxford, in 1845, graduated B.A. in 1848, and in 1852 became a fellow of Merton College. In 1853 he became curate of Alflington, Devon, and in the following year he was ordained priest. He then joined George Augustus Selwyn, bishop of New Zealand, in a mission to the Melanesian islands. There he laboured with great success, visiting the different islands of the group in the mission ship the "Southern Cross," and by his good sense and devotion winning the esteem and affection of the natives. His linguistic powers were

1 The word is taken from an obsolete French *chopine* or Spanish *chapín*, and is of doubtful origin. The Spanish *chapín*, flat plate, has been suggested. The word does not occur in Italian, though it is often italicized in English in such forms as *cioppino*. 

exceptional, and he spoke 23 languages with ease. In 1861 he was consecrated bishop of Melanesia, and fixed his headquarters at Mata. He was killed by natives at Nukapu, in the Santa Cruz group, on the 20th of September 1871, the victim of a tragic error. The traders engaged in the nefarious traffic in Kanaka labour for Fiji and Queensland had taken to personating missionaries in order to facilitate their kidnapping; Patteson was mistaken for one of these and killed. His murderers evidently found out their mistake and repented of it, for the bishop's body was found at sea floating in a canoe, covered with a palm fibre matting, and a palm-branch in his hand. He is thus represented in the base-relief erected in Merton College to his memory.

See Life by Charlotte M. Yonge (1873).

PATTI, ADELINA (1821-1898), soprano singer, was born on 7th February 1821 in Milan, the daughter of Giovanni Patti, a music teacher. Her talent was discovered at an early age, and she made her debut at the age of 12. Her voice was described as "peculiarly rich and beautiful," and she quickly became known throughout Europe.

In 1839, she married the tenor Charles Santley, and they had two children. However, their marriage was short-lived, and they separated in 1841.

Patti's career flourished in Italy, where she performed at La Scala in Milan. She then moved to Paris, where she achieved further success and became known as "La Diva." Her performances were celebrated for her elegance and grace.

In 1852, Patti married the English conductor and composer Sir Charles Hallé. However, their marriage was not a happy one, and they separated in 1855.

Patti's career continued to be successful, and she performed in many of the most famous opera houses around the world. She was known for her ability to bring tears to the eyes of her audiences with her moving performances.

Patti's voice was described as "exceptional," and she was known for her ability to sing a wide range of emotions. She was particularly known for her ability to sing tragic roles, and she was often referred to as "The Queen of Tragedy."

After the death of her first husband, Patti married the American conductor and composer Charles H. Eastman in 1878. She continued to perform until her retirement in 1890, and she died in London on 11th September 1898.
PAU—PAUL, THE APOSTLE

of Faith. He was editor, with Dr Briggs, of the Presbyterian Review, in 1880–1888. He wrote The Inspiration of the Scriptures (1860), and Summary of Christian Doctrine (1874). PAU, a city of south-western France, chief town of the department of Basses-Pyrénées, 66 m. E.S.E. of Bayonne on the southern railway to Toulouse. Pop. (1906), 30,315. It is situated on the horizon of a plateau a 130 ft. above the right bank of the Gave de Pau (a left-hand affluent of the Adour), at a height of about 620 ft. above the sea. A small stream, the Hédas, flowing in a deep ravine and crossed by several bridges, divides the city into two parts. The modern importance of Pau is due to its climate, which makes it a great winter health-resort. The most striking characteristic is the stillness of the air, resulting from the peculiarly sheltered situation. The average rainfall is about 33 in., and the mean winter temperature is 43°, the mean for the year being 56°.

The town is built on a sandy soil, with the streets running east and west. The Place Royale (in the centre of which stands Nicolas Bernard Raggi's statue of Henry IV., with bas-reliefs by Antoine Étex) is admired for the view over the valley of the Gave and the Pyrenees; it is commanded by the magnificent Boulevard des Pyrénées with the castle gardens. Beyond the castle a park of thirty acres planted with beech trees stretches along the bank of the Gave. Access to the castle is obtained by a stone bridge built under Louis XV.; this leads to the entrance, which gives into a courtyard. On the left of the entrance is the donjon or tour de Gaston Phébus. On the right are the tour neuve, a modern erection, and the Tour de Montaumet (Monte-Oiseau), the higher storeys of which were reached by ladders; the Tour de Bihères faces north-west, the Tours de Mazarès south-west. Another tower between the castle and the Gave, the Tour de la Monnaie, is in ruins.

In the gardens to the west of the castle stand a statue of Gaston Phébus, count of Foix, and two porphyry vases presented by Bernadotte king of Sweden, who was born at Pau. On the ground-floor is the old hall of the estates of Béarn, 85 ft. long and 36 ft. wide, adorned with a white marble statue of Henry IV., and magnificent Flemish tapisseries ordered by Francis I. Sevres of the upper chambers are adorned with Flemish, Brussels or Gobelins tapestry, but the most interesting is that in which Henry IV. is said to have been born, containing his cradle made of a tortoise-shell, and a magnificent carved bed of the time of Louis XII. The churches of St Jacques and St Martin in the Gothic style are both modern. The lyceé occupies a portion of the buildings of a Jesuit college founded in 1622. The prefecture, the law-court and the hôtel de ville present no remarkable features. Pau is the seat of a court of appeal and a court of assizes and has a tribunal of first instance, a tribunal of commerce and a chamber of arts and manufactures. There are training colleges for both sexes, a library, an art museum and several learned societies. Pau owes most of its prosperity to its visitors. The golf club, established 1856, has a course of 18 holes, on the Plaine de Bihère, about a mile from the town. Among the industrial establishments are flour-mills, cloth factories and tanneries, and there is trade in wine, hams, horses, and tobacco.

Pau derives its name from the word pal, in allusion to the stakes which were set up on the site chosen for the town. It was founded probably at the beginning of the 11th century by the viscounts of Béarn. By the erection of the present castle in the latter half of the 14th century, Gaston Phébus made the town a place of importance and after his death the viscounts of Béarn visited it frequently. Gaston IV. granted a charter to the town in 1464. François Phébus, grandson and successor of Gaston, became king of Navarre in 1479, and it was not until 1512 that the loss of Spanish Navarre caused the rulers of Béarn to transfer their residence from Pamplona to Pau, which till 1589 was their seat of government. Margaret of Valois, who married Henri d'Albert, made her court one of the most brilliant of the time. In 1533 her daughter Jeanne d'Albert gave birth to Henry IV., at Pau. It was the residence of Catherine, sister of Henry IV., who governed Béarn in the name of her brother. In 1620 when French Navarre and Béarn were reduced to the rank of province, the intendants took up their quarters there. In the 19th century Abé-el-Kader, during part of his captivity, resided in Pau.

PAUL, "the Apostle of the Gentiles," the first great Christian missionary and theologian. He holds a place in the history of Christianity second only to that of the Founder himself. It was no accident that one who has been styled "the second founder of Christianity" was born and bred a Pharisee. Rather it was through personal proof of the limitations of legal Judaism that he came to distinguish so clearly between it and the Gospel of Christ, and thereby to present Christianity as the universal religion for man as man, not merely a sect of Judaism with proselytes of its own. For this, and nothing less, was the issue involved in the problem of the relation of Christianity to the Jewish Law; and it was Paul who settled it once and for all.

A modern Jew has said, "Jesus seems to expand and spiritualize Judaism; Paul in some senses turns it upside down." The reason of this contrast is their respective attitudes to the Law as the heart of Judaism. Jesus seems never to have perceived the atmosphere of Rabbinic religion.1 Hence his was a purely positive reinterpretation of his religion as a whole. His attitude to the Law was one of habitual dutifulness to its ordinances, combined with sovereign freedom towards its letter when the interests of its spirit so required (cf. F. J. A. Hort, Judaistic Christianity, chap. ii.). To this the primitive apostles and their converts in the main adhered, without seeing far into their Master's principle in the matter; nor did they feel any great straitening of the spirit by the letter of the Mosaic, rather than the Rabbinic Law. But with Paul it was otherwise. As Saul the Pharisee he had taken the Mosaic Torah as divine Law in the strictest sense, demanding perfect inner and outer obedience; and he had relied on it utterly for the righteousness it was held able to confer. Hence when it gave way beneath him as means of salvation—nay, plunged him ever more deeply into the Slough of Despond by bringing home his inability to be righteous by doing righteousness—he was driven to a revolutionary attitude to the Law as method of justification. "Through the Law he "died unto (the) Law," that he "might live unto God" (Gal. ii. 19). By this experience not only Pharisaic Judaism, but the legal principle in religion altogether, was turned "upside down" within his own soul; and of this fact his teaching and career as an apostle were the outcome.

But Paul had in him other elements besides the Jewish, though these lay latent till after his conversion. As a native and citizen of Tarsus, he had points of contact with Greek culture and sentiment which help to explain the sympathy and tact with which he adapted his message to the Greek. As a Roman citizen likewise, conscious of membership in a world-wide system of law and order which overrode local and racial differences, he could realize the idea of a universal religious franchise, with a law and order of its own. Both these factors in his training contributed to the moulding of Paul the missionary statesman. In his mind the conception of the Church as something catholic as the Roman Empire first took shape; and through his wonderful labours and combinations of his message the Church of the New Testament was now finally laid. In giving some account of this man and of his teaching, we shall expound the latter mainly as it emerges in the course of his personal career.

Method.—Paul's outer letters are our critical basis, as F. C. Baur and the Tübingen school made clear once for all. The book of Acts and other sources of information are to be used only so far as they are necessary to elucidate and confirm the documents of Paul himself. This is the principle of the method of redaction criticism. Hence our object is to follow the individual development and expansion of the Pauline ideal in the letters by the method of what is called interpretation of the letter. This, however, means the following of the letter of Paul himself, and this is not to be done by the method of the critical edition of a document. Hence, in following the letter of Paul, we have no right to use any of the later redactions; we must return to the earlier and less developed points of view in the letters themselves. The following of the letter of Paul in the spirit of the letter of Paul is, however, the only method by which the letter of Paul can be used as the basis of a critical interpretation of the Christian message. Hence the following of the letter of Paul is the only method by which the letter of Paul can be used as the basis of a critical interpretation of the Christian message.
are compatible with the letters, as our only strictly contemporary documents. If our results to-day are far more positive than those of the Tübingen critics, this is due partly to the larger number of letters now generally acknowledged as Paul's (some eight or ten), and partly to a fuller knowledge of Jewish and the Graeco-Roman world. These are seen to have embraced more varied religions of thought and feeling than used to be assumed. The "particularistic" tendency in Judaism was more limited than Baur supposed, while the Gentile Christians generally were far from Pauline in their modes of conceiving either Law or Gospel.

Chronology.—This has been discussed by Sir W. M. Ramsay in Pauline Chronology (1907), and again by Ramsay's Egypt and the Dict. of the Bible (article "Chronology of New Test."). Their results agree in the main for the period when precision first becomes possible, viz. between Paul's first missionary journey and his arrival in Rome. Hence, the dating of the years early and later extremes (Clemen argues for 61). On the chronology from Paul's conversion down to the Relief visit (Acts xi. 30), c. 45-47, hardly two scholars agree; but on the whole the tendency is to put his conversion rather earlier than was formerly usual.

I. Paul's Life.—"Saul, who is also Paul," was "a Hebrew, of Hebrews born, i.e. of strict Jewish origin, and of the tribe of Benjamin (Phil. iii. 5; cf. 2 Cor. xi. 22). Yet, as his double name suggests, he was not reared on Jewish soil but amid the Dispersion, at Tarsus in Cilicia, the son of a Roman citizen (Acts xxii. 28; cf. xvi. 37, xxvii. 27). "Saul," his Jewish name, was a natural one for a Benjamite to bear, in memory of Israel's first king. "Paul" was his name for the non-Jewish world, according to a usage seen also in John Mark, Simeon Niger, &c. Paulus was not an uncommon name in Syria and eastern Asia Minor (see the Targum in Boeckler, Corp. inscr. Tars.). It is a natural one for the son of a Roman citizen. Ramsey develops this point suggestively (Pauline and Other Studies, p. 65).

"It is as certain that he had a Roman name and spoke the Latin language as it is that he was a Roman citizen. If, for example's sake, we could think of him sometimes as Gaius Julius Paulus—to give him a possible and even not improbable name—how completely would our view of him be transformed. Much of what has been written about him [as a narrow, one-sided Jew] would never have been written if Luke had mentioned his full name." Nor would much of the same sort have been written, if the influences due to his Tarsian citizenship (xxi. 39), viewed in the light of the habits of Jewish life in Asian cities, had been kept in mind. He was a trained Pharisee, producing an amalgamated society in which the Oriental and Occidental spirit in unison attained in some degree to a higher plane of thought and action" (id., The Cities of St. Paul, 80).

Accordingly it is natural that Paul's letters should bear traces of Hellenic culture up to the level of a man of liberal education. Whether he went beyond this to a first-hand study of philosophy, particularly of the Stoic type for which Tarsus as a university was famous, is open to question. In any case Paul had learnt, when he wrote his epistles, to value Greek "wisdom" at its true worth—the suggestiveness and sanity of its best thoughts, yet at the same time its inadequacy to meet the deeper longings of the human spirit. Above all he felt the mental and moral shallowness of the verbal "show of wisdom" which marked current philosophical rhetoric.

Thanks to his letters, we can form some idea of the character and strength of the element in Paul's early life due to Judaism. Looking back, he says (Phil. iii. 4-7), "If any other man thinketh to have confidence in the flesh, I yet more. Circumsized the eighth day, . . . a Hebrew of Hebrews; as touching the Law, a Pharisee; as touching the righteousness which is in the Law, found blameless." Howbeit what things were gain to me, these have I counted loss for Christ. "He came indeed to regard such inherited advantages in themselves things of "the flesh," natural rather than spiritual (Rom. vi. 9). Yet as advantages, tending to awaken the spirit's thirst for God, he did esteem them, seeing in them part of the preparation vouchsafed by divine providence to himself (Gal. i. 15). Upon the "advantage of the Jew," as "entrusted with the oracles of God" (Rom. iii. 1 seq.), he dwells in Rom. ii. 17 in a way suggestive of his own youthful attitude to "the name of a Jew." Thus we may imagine the eager boy in Tarsus, as developing, under the instructions of a father strictly loyal to the Law, and under the teaching of the synagogue, a typical Jewish consciousness of the more serious and sensitive order.

A good deal depends on the age at which the young Saul passed from Tarsus to Jerusalem and the school of Gamaliel. If he felt his vocation as teacher of the Law at that earliest possible age, it would be convenient for the argument to come soon after his fifteenth year, when Rabbinic studies might begin. This would well accord with the likelihood that he never married. But in any case we must not exaggerate the contrast involved, since he came from a Phariaseic home and passed to sit at the feet of the leader of the more liberal Palestinian Rabbinism. The transition would simply accentuate the legal element in his religious life and outlook. Nor was it mere personal acceptance with God that floated before his soul as the prize of such earnestness. The end of ends was a righteous nation, worthy the fulfillment of the divine promises. But this too could come only by obedience to the Law. Thus all that the young Pharisee cared for most hung upon the Law of his fathers.

Outwardly he obtained the goal of legal blamelessness as few attained it; and for a time he may have felt a measure of self-satisfaction. But if so, a day came when the inner meaning of the Law, as extending to the sphere of desire and motive, came home to him in stern power, and his peace fled (Rom. vii. 9). For sin in his inner, real life was unsubdued; nay, it seemed to grow ever stronger, standing out more clearly and defiantly as insight into the moral life grew by means of the Law. To the Law he had been taught to look for righteousness. In his experience it proved but the means to "knowledge of sin," without a corresponding impulse towards obedience. Not only did it make him realize the latent possibilities of evil despite the law (Rom. vii. 19) and even its "fruits," (Gal. v. 19), but, as the powerless, he felt it, the reaction of self-will against the demands of the Law. While one element was in abiding harmony with the will of God, the other was in equal sympathy with "the law of sin." Could the Law achieve the separation, making the moral person "die" to "the flesh" and so escape its sway? No, answered Saul's experience: the Law rather adds power to sin as self-will (1 Cor. xv. 56; Rom. vii. 13). Whence then is deliverance to come? It can only come with the Messianic age and through Messiah. The Law would reign inwardly as outwardly, being "written on the heart" as promised in the prophecy.

So may we conceive the position reached by Saul, though not with full consciousness, before he came into contact with Christianity. But he realized that "through the Law he had died to the Law" (Gal. iii. 19), much less the logical bearing of this fact upon the nature and function of the Law. How then would the message, "Jesus is the Messiah," strike such a
man? It would be a blasphemous caricature of things most sacred. It is doubtful whether he had heard Jesus Himself (2 Cor. v. 16 has perhaps another meaning). He may even have been absent from Jerusalem in the first days of apostolic preaching, possibly as a rabbi in Tarsus. But if so, his ardent nature soon brought him on the scene, in time at least to hear Stephen and take part against him (Acts vii. 58, 60).

If the simple message of the first witnesses, that one whose life and preaching were largely out of harmony with the Law as Saul understood it, had in fact been raised from the dead by Israel's God and so vindicated—to the condemnation of that generation of God's people—if this seemed to Saul mere madness, what was he to say to Stephen's views as to the Law and the people of the Law, both past and present? (see Stephen.) Saul was not right in the views which still divided them. Perish the thought! Perish too all those who upheld the crucified Nazarene, the assured of the Law! For His deeper consciousness by one and another of these. Either were accused of God also, or—awful alternative—yet inevitable—on Saul's logical mind—the Law relative to which He was accused was itself set aside. Saul turned from the suggestion as too shocking to his pride alike in his people and in its divine Law, for him seriously to consider its alleged credentials—the Resurrection, and the supernatural power and goodness of Him whose claims it was held to confirm. Why to stay the evidence of Galilean common folk (Am-ko-aets), themselves lax in their observance of Thorah, when over against it stood the whole weight of immemorial prescription, and the deliberate judgment of the custodians of the Law as to this man as a 'deceiver'? No doubt they were self-deceived fanatics. But the logic of the movement had at length declared itself through the mouth of Stephen, and weak toleration must be abandoned.

Saul the Persecutor. Law. Yet the goading of unsatisfied intuitions did not cease. We may even suspect that Stephen's philosophy of Israel's history had made an impression on him, and was undermining his confidence in the infallibility of his nation's religious authorities. If mistaken before, why not again? This granted possible, all turned on the evidence as to the Resurrection of the crucified Prophet of Nazareth. Yet though the joyous men of His followers, even when confronted with death, seemed to betoken a good conscience before God, which could hardly fail to impress him, Saul felt the status of the Law to be too grave an issue to depend on the probabilities of human testimony. So he plunged on, in devotion to what still seemed the cause of God against impugners of His Thorah, but not without his own doubts. He was, in fact, finding it hard to kick against the goad. (Acts xxvi. 14) piled in his deeper consciousness, as he so firmly followed his inherited less personal beliefs. He was, in language which he later applied to his compatriots, loth to "submit himself to the righteousness of God." (Rom. x. 3) when it came in a manner humbling to his feelings. Still he was in the main honest (1 Tim. i. 13), and the hindrances to his belief were exceptional. Direct personal experience on the point on which all hinged, the alleged divine vindication of Jesus as Messiah following on the legal condemnation by the national authorities, was needful to open up a clear exit from his religious impasse.

It was at this critical point in his inner history that, as he neared Damascus on a mission of persecution, there was granted him—as he believed ever after in the face of all challenge—a vision of Jesus, in risen and glorified humanity, as objective as those to the original witnesses with which in 1 Cor. xv. he classifies it.

As to the sense in which this vision, so momentous in its issues, may be regarded as "objective," the following points deserve notice. On the one hand it is generally agreed (1) that Paul distinguished this appearance of the risen Jesus from his other "visions and revelations of the Lord," as he refers to it in 2 Cor. xii. 1 sqq., and classified it with those to the Twelve and others; (2) that this belief included for Paul a transformed or spiritualized body (cf. the note of time, "on the third day," and the argument in 1 Cor. xv. 12 sqq., 35 sqq.), his own vision of which seems to colour his conception of the Resurrection body generally (Phil. iii. 21, though he had nothing to do with an "adulterous and evil generation") to start with; cf. 2 Cor. v. 1 sqq. with Apoc. Baruch, xlii.-lii., representing Jewish belief about A.D. 70–100, and see Dr R. H. Charles's ed.). On the other hand, analogies furnished by religious psychology, including a sudden uplifted and radiant light and a corresponding inundation of religious crisis in certain cases, affect our ability to take Saul's consciousness in the matter as a simple transcript of objective facts. There is indeed reason to believe that the dazzling light was an effect of Saul's blindfold, if it is, and that he so identified his companions (xxii. 9, xxvi. 14). But beyond this physical prelude to his vision we cannot go critically. Thus the nature of the connexion between the light as an objective antecedent, and Saul's own result, remains doubtful on the plane of history. It is possible to penetrate further only by the aid of faith, with or without speculations based on certain psychical facts more and more establishing themselves to scientific minds. Religious faith, dwelling on the unique issues of the vision in the history of Christianity and arguing from effects to a cause as real as themselves, tends to postulate the objectivity which Saul himself asserts. Some do so in an absolute sense, in spite of the differences between Saul's experience and that of his companions (Acts ix. 7, xxix. 9). Others maintain that by a divine act, a voice, or a movement on Saul's brain a vision not due simply to the antecedents in himself. Thus it was not merely subjective, a mere vision in the sense of hallucination, but an objective vision or genuine revelation of the Lord. Saul's claim to have been so treated by Paul himself, in this but a special form of what is involved in any real divine revelation, accords in general with modern research as to telepathy and phantasms of distant or deceased persons. But, after all, the essential, that Saul's vision of God through Paul's agencies, to his own self, remains doubtful on the plane of history. Is the question as to the degree of discontinuity between his thought before and after the event. On this Paul is clear and emphatic; nor can we here go behind the evidence of one event, which others prove him a master in introspective reflection, "There was no possibility that he should by any process of mere thinking come to realize the truth." as to Jesus, so rooted were the prejudices touching things divine which barred the way (see Ramsay, Pauline and Other Studies, p. 18).

Important as is the question as to the nature of the vision which changed Saul's career, it is its spiritual content which bears most upon the story of his life. Jesus was, in spite of all, God's Messiah, His Righteousness Content. One, His Son, the type and ideal of righteousness in man, through spiritual union with whom like righteousness was to be attained, if at all. In a flash Saul's personal problem as to acceptance with God and victory over sin was changed. It became simply a question how spiritual union with the Messiah was to be come about. He had vanquished and "condemned sin in the flesh." by His perfect obedience (Rom. viii. 3, v. 19), of which the Cross was now seen to be the crowning act. As for the Law as means of justification, it was superseded by the very fact that Messiah had realized His righteousness on another principle altogether that of "works of the Law," and had in consequence been crucified by its action, as one already dead to it as a dispensational principle. This meant that those united to Him by faith were themselves sharers in His death to the Law as dispensational master and judge, and so were quits of its claims in that new moral world into which they were raised as sharers also in His Resurrection (Rom. vi. 1–vii. 6). Henceforth they "lived unto God" in and through Messiah, by the selfsame Spirit by which He had lived the sinless life (viii. 9).

Here we have at once Paul's mysticism and his distinctive gospel in germ, though the full working out in various directions came only gradually under the stimulus of circumstances. But already the old régime had dissolved. His first act was to make explicit, through confession and baptism, his submission and adhesion to Jesus as Messiah implicit in his cry from the ground, "What shall I do, Lord?" Thereby he formally "washed away his sins." (Acts xxii. 16; cf. Rom. x. 9). Then with new-born enthusiasm he began boldly to proclaim in the synagogues of Damascus that Jesus, whose followers he had come to root out, was verily the Messiahian Son of God (ix. 20; Matt. xvi. 16). Yet ere long he himself felt the need for quiet in which to think
out the theory of his new position. He withdrew to some secluded spot in the region south of Damascus, then vaguely called Aretas, and, in 

Paul, the Apostle

down of his self-confidence, conditions essential to a mature filial relation between man and God. Nor did Paul deny the positive or directly beneficent, though limited, function of the Law, so far as it was viewed in the light of the grace of God, as by prophets, etc.

The Law, like other human institutions, is not as meriting His approval as of right by "works of law," but, objects the modern Jew, the notion of Rabbinic Judaism as generally tained by "legalism" in any such sense, is a mere figment of Paul’s. However, it is unanswerable and improbable that Paul unfairly represents the prevailing tendency in the Pharisaic Judaism of his own day as "legalistic" in the bad sense. He is really the one extant witness upon the point, as just defined, if we except certain apocryphal, viz. "Seth," who commands the "legalism" of his time to be held in contempt, a work, indeed, which is unlikely to be the spirit of the Law, cites with approval his words, "There is no distinction between Jew and Greek," and adds, "Not till St Paul had written did the prophetic universalism attain its goal." Surely there is a vital connexion between these two, things. "Universalism" was the true issue of the higher tendency in Hebraism, as seen in certain of Israel’s prophets. But it was attained only through Jesus of Nazareth; and historically the main link between His supra-legal universalism and its actual outcome in the Christian Church was the ex-Pharisee Saul, with his anti-legal gospel.

Saul’s conversion left Jesus the Christ as central to his new world as the Law had been to his old. All was summed up in Christ, and Him crucified. This was to him the essence of Christianity as distinct from Judaism. As to the Jew, life was lived under the Law or in it as native element, so the Christian life was “in Christ” as element and law of being. Christ simply replaced the Law as form and medium of relations between God and man. In this Paul went far beyond the older apostles, whose simpler attitude to the Law had never suggested the problem of its dispensational relation to Messiah, though in fact they relied on Messiah alone for justification before God. The logic of this, as Paul later urged it on Peter of Antioch (Gal. ii. 15 sqq.), they did not yet perceive. To Him it was clear from the first. But the contrast goes farther, and very far in which Jesus was known to Saul by direct experience, namely, as a spiritual being, in a body already glorified in virtue of a regnant “spirit of holiness”—revealed by the Resurrection as the essence of His personality (Rom. i. 4)—determined all his thought about Him. To this even Jesus’ earthly life, real as it was, was subordinate. Paul was not indifferent to Jesus’ words and deeds, as helping to bring home in detail the spirit of Him who by resurrection was revealed as the Son of God; but apart from insight into His redemptive work, knowledge of these things was of little religious moment. The extent of Paul’s knowledge of the historical Jesus has been much debated. Few think that he had seen Jesus in the flesh; some even deny that he knew or cared for more than the bare facts to which he alludes in his epistles—the Davidic birth, the institution of the Supper, the death and resurrection. But beyond his express appeals to precepts of the Lord in I Cor. vii. 10, ix, 14 (cf. Rom. xii. 14), he “shows a singularly intimate and character of Jesus as it is described in the Gospels” (see 2 Cor. xiii. 3). Sources of such knowledge were no doubt oral, e.g. Peter (Gal. i. 18), Barnabas, Mark, as well as collections of Jesus’ words, along with connected incidents in his life, used in catechism. Thus Saul’s attitude to Jesus was fixed by his own experience. The varied theorectic expressions found in his writings as to Christ’s relations to God, to mankind, and even to the universe, were to him but corollaries of this. The most persistent element in his conception of Christ’s person, viz. as a heavenly being, who, though God’s Son, voluntarily humbled Himself and suffered in fulfillment of God’s will, and had in consequence been exalted to fresh glory, took its start from his own personal experience, although it included the speculative postulate of pre-existence in terms of some current Messianic form of thought. Paul’s theory expressed the deeper sense of the all-inclusive significance of Christ, in keeping with his own experience. Hence, too, all his distinctive thoughts on religion, sometimes called
Paul, the Apostle

Paulinus (see below), were both experimental in origin and capable of statement in terms of his Christ. To him the Death and Resurrection of Christ was a fact, nor abstractions of the more subtle kind, nor faith, the crucial fact of Christ’s Resurrection, in full spiritual humanity, had been brought within his own experience; so that here, and not in any second-hand facts touching Christ’s earthly career, lay the real and verified basis of the whole Christian life. This makes his gospel so individual, and at the same time so universal—for those at least who at all share his religious experience.

It is unlikely that Saul began straightforward to preach all his ideas or even those most prominent in his epistles, which belong only to some ten years at the end of a ministry of some thirty. In particular his special mission to the Gentiles dawned on him only gradually. No doubt as he looked back in writing Gal. i. 15 seq., he felt that the final purpose of God in “revealing His Son in him” had been that he “might preach Him among the Gentiles.” But this does not prove that he saw it all at once as involved in the “heavenly vision.” For one thing the contract horizon afforded by the hope of a speedy second Advent (Parousia) would limit his outlook materially. The probability is that he was intensely Jewish to begin to declare salvation through Christ alone, apart from “works of the Law,” to his compatriots. Only bitter experience convinced him (Rom. ix. 1 sqq., x. 1 sqq.) that the Jews as a people did not share his experience as to the Law, and spurned their proffered birthright in Messiah.

Saul began his preaching in the synagogues of Damascus, and made a deep impression, especially, we may suppose, after his return from Arabia (Acts ii. 22; Gal. i. 17). But finally his Jewish opponents planned to do away with him, by the consciousness of the etharch of King Aretas (cf. 2 Cor. xi. 32 seq.). Then came his first visit to Jerusalem since his conversion, in the third year from that event, for the purpose of making the personal acquaintance of Peter (Gal. i. 18), presumably to hear first-hand about Jesus’ earthly ministry and teaching, as well as to make the leading apostle directly acquainted with his own remarkable conversion and mission. It was natural that Barnabas should help to break through the suspicion with which the arch-persecutor was still regarded; and that such preaching as Saul did in Jerusalem should be directed to the heart of his Cilician compatriots (ix. 29; cf. vi. 9). This led to his having to leave suddenly, apparently after a vision in the Temple which brought him fresh light as to the scope of his future ministry. During the ten or eleven years at least “in the regions of Syria and Cilicia” which ensued, it was still primarily to the Jews that he preached; for the news of him which reached “the churches of Judaea” from time to time (ἀποστράφθησαι) was such that they “kept glorifying God” in him (Gal. i. 21–23), as they certainly would not have done had he all along addressed himself largely to Gentiles. His preaching, that is, was for the most part confined to the synagoge and its adherents of non-Jewish origin, whether circumcised or not. Of Saul’s actual history, however, during these obscure years we gain only rare glimpses, the first and most important being in connexion with the foundation at Antioch of a mixed Church of Jews and Gentiles. Whatever may have been the first beginnings of this new departure (a question which depends on the alternative readings of “Hellenists” and “Greeks” in Acts xi. 20), a situation soon arose which Barnabas, who had been sent from Jerusalem to supervise the work begun by certain to Bithynia, refused to turn back. This brought into operation. He sought him out in Tarsus; and “for a whole year” the two enjoyed the hospitality of the Antiochene Church and instructed numerous converts—including not a few uncircumcised Gentiles. It is not clear how far Saul continued to reside in Antioch after his first “whole year” of continuous work as colleague of Barnabas. It no doubt remained his headquarters. But we may imagine him evangelizing also in the region between Antioch and Tarsus (Gal. i. 21; cf. Acts xv. 23, 41). Whilst so engaged, whether at Antioch or elsewhere, he seems to have attained quite a fresh sense of the degree to which Gentiles were destined to form an integral part of that “Israel of God” which was being gathered through faith in Jesus as the Christ (cf. the name “Christians,” Acts xi. 26). Writing about summer A.D. 56, he speaks of having had an overpowering revelation some thirteen years previously (2 Cor. xii. 1–4), that is, about 42–43, the very period now in question. He says nothing, it is true, as to its theme; but it can hardly have been connected with his central preoccupation, the scope of the Church, as set forth later in Ep. i. 12–15.

Saul’s relations with the Jerusalem community between his coming to Antioch and his final relinquishing of it as his headquarters about A.D. 50 (a period of some ten years), form a crucial point in his missionary life. The extreme Tubingen theory that Saul was “not, and ever since, in sharp conflict with the leaders in Judaea, is a thing of the past.” But many problems remain about Saul’s mission. It is only on its own merits, as seeming to best unify the relevant data in the light of all we know of Paul as a man and a missionary. Points of divergence from current views will be indicated as far as possible.

Such a new revelation would naturally lead to more definite efforts to win Gentiles as such, and this again to his second visit to Jerusalem, some eleven years after his former visit (or rather more than thirteen, if the interval in Gal. ii. 1 be reckoned from that visit and not from his conversion). He would come to feel the need of a clear understanding with Jerusalem touching his gospel, lest perchance he should run in vain or have already so run” (ii. 2). Saul was not the man to wait for a foreseen evil to develop. “In accordance with a revelation” he induced Barnabas to accompany him to a private conference with the leaders in Jerusalem, to lay before them his gospel (ii. 2). The date of this was c. 43–45. His aim was to confer solely with leaders (contrast Acts xv. 4, 12) like James and Cephas and John, the “pillars” of the Jerusalem community. But certain persons who showed such a spirit as to make him describe them as “pseudo-brethren,” managed to be present and demanded the circumcision of Titus, a Greek whom Saul had taken with him. In this demand he saw a blow at the heart of his gospel for Gentiles, and would not give way. The “pillars” themselves, too, felt that his distinctive mission was bound up with Gentile freedom from obligation to the Mosaic Law as such. They recognized Saul and Barnabas as entrusted with a specific Gentile mission, parallel with their own to Jews. Only, as pledge that the two should not divide but remain sister branches of Messiah’s Ecclesia, until he should return and remove all anomalies, they asked that the “Gentiles” should prove the genuineness of its piety by making it a habit to “remember the poor.” Here was a proviso which Saul was as eager as they could be to get carried out; and this he was able to prove ere long in the special form of "How essential a mark of true piety such conduct was in the eyes of Jews at this period is well known. A synonym for almsgiving was "righteousness" (cf. Matt. v. 1 seq.); it is specially praised, in the Ps. (48), along with Torah and divine worship, as the "three things on which the world rests"; while in Bab. Bataa 22b, a "Gentile" is described as a "Gentile for the Gentiles." In the light of this, confirmed by Acts x. 2, 4, in the case of Cornelius, it seems that the reference in Gal. ii. 10 is to deeds of charity generally, as a token of genuine piety in Messianic proselytes, just as in ordinary Jewish ones; for the primitive Judaic-Christian community was most earnest on the point: cf. Acts ii. 44 seq., iv. 32–37.

1 Here Galatians i. 18 sqq. emphasizes its own special points of interest, in that Saul stayed only a fortnight and saw of the apostolic leaders none save Peter and James the Lord’s brother; whereas Acts ii. 14 says quite a different account of the more probable influence which Peter conveyed a rather different effect, yet one not incompatible with what he himself relates.

2 It is likely that some at least of the five scourgings in synagogues referred to in Cor. xi. 24, befell him during this period. Many Jews would resent not only the preaching of a crucified Messiah, but also the flitching from them of their proselytes.

3 The present writer now believes that “Hellenists,” the better supported reading (see Acts), is yet secondary, being due to assimilation to preceding usage in vi. 1, ix. 29, and possibly also to misinterpretation of the turning to the Gentiles in xiii. 46.
relief to the poor in Judaea, which he and Barnabas fitly administered in person (Acts xi. 30, xii. 25). This relief visit took place about 45–46. Having now reached an understanding with the leaders in Jerusalem as to his mission to the Gentiles Saul felt anxious to break fresh ground, and probably broached the subject to the local leaders. As they waited on God for guidance, the Spirit through one of the “prophets” directed that Barnabas and Saul be set apart for such an enterprise; and this was done in solemn form (xii. 1–3). Naturally Barnabas thought of his native Cyprus; and thither they sailed, about spring A.D. 47, with Mark (q.v.) as their assistant.

That they had at least one other companion is probable not only from the phrase “Paul and his company” (xiii. 13), but also from the traces of eyewitness in the narrative of Acts (see Luke). Their work lay at first in synagogues.

But at Paphos an unparalleled event occurred, to which due prominence is given. The Roman proconsul, Sergius Paulus, a man whose wide religious interest showed itself in having about his person a Jewish prophet with magical pretensions, sent for the new preachers. Barjesus, the magus or wizard (as his surname, Elymas, probably denotes), opposed the rivals to his patron’s attention; and this brought Saul decisively to the front. His fitness for his part, as no mere Jew but in a sense Roman facing Roman, is indicated by the pointed description, “Saul, who is also Paul.” His intervention procured the confusion of the magus and the conversion of the proconsul. This incident—so significant of the future in many ways—marked the beginning of a new prominence of Paul in the conduct of the mission (cf. “Paul and his company”). Further, on leaving Cyprus the mission entered the region where Paul, not Barnabas, was most at home. At Perga in Pamphylia a fresh decision was reached as to the route now to be taken, and this led to Mark’s withdrawing altogether (see Mark).

It does not seem that the personal factor weighed most with Mark; rather it was the nature of “the work” itself (xv. 38). Perhaps he had been tacitly aware that the mission would cross the Taurus range to the different world beyond, and keep to the coast-lands south of that great natural barrier, which were in close relation with Antioch and Syria generally. Accordingly, when Paul at last outlined the larger scheme, which had perhaps lain in principle in his own mind all along, Mark recoiled from its boldness. The natural thing indeed was to evangelize in Pamphylia, a country in close relations with Cilicia and Syria. Why then did Paul go to Antioch in inland Syria, did the step cut the high table-land some 3000 ft. above sea-level? Not to evangelize in Pisidian Antioch, and the other cities in the south of Roman Galatia lying to the east of it; for Paul himself says that his preaching there was “the first fruits of his advent” (xv. 13), this being the point of entry to other fields. These would be in the first instance certain cities in the south-east of the Roman province of “Asia,” where Jews abounded and had a large Gentile following. Had the great cities of western Asia, and further south, and to the eastward, presented a high standard of life, he would have taken the easier and more direct route running west-north-west through Laodicea. Sir W. M. Ramsay thinks that Paul sought the Galatian highlands on purpose to get rid of malarial fever, contracted in the lowlands of Pamphylia. But Mark would hardly have left under these conditions. It seems better to suppose that it was only on the arduous journey to Antioch, amid “perils of rivers, perils of robbers,” or even after his arrival there, that the party of Paul would have to reduce its standard, and thus come to a pitiable state, as of one smitten by the wrath of some deity, in which he preached to the Galatians in the first instance (Gal. iv. 13 seq.).

It was in the late summer or autumn of A.D. 46 or 47 that Paul arrived in the Pisidian Antioch, a considerable Roman colony. Its population was typical of the Graeco-Oriental part of the empire. It included the native Galatians.

Anatolian, the Greek, and the Jewish elements, so frequently found together in Asia Minor since the days of the Seleucid kings of the Hellenistic period, which used Jews as colonists attached to their cause. The Anatolian ground-stock had marked affinity with the Semitic peoples, though it was Hellenized in speech and education. It is in this light that we must view the enthusiasm with which Paul’s gospel was received (xii. 44 seq.; Gal. i. 26 seq.), which marked an epoch in his ministry to the Gentiles. It was here and now that he uttered the memorable exclamation: “It was necessary that the word of God should first be spoken to you: seeing ye thrust it from you, and judge yourselves unworthy of eternal life, lo, we turn to the Gentiles” (xiii. 46). Yet even so he did not here and now give up all hope that the Jews of the Dispersion with their more liberal conception of Judaism, might be won over to a spiritual rather than a national fulfilment of “the promise made to the fathers” by “the voices of the prophets” (xiii. 26–28, 32 seq., 38 seq.). Primarily this “turning to the Gentiles” had for Paul only a local meaning, as he continued to begin in each city with the synagogue. But the emphasis laid on the incident in Acts shows that to one looking back it had a more far-reaching meaning, since henceforth Paul’s work was in fact to lie mainly among Gentiles.

Paul’s experiences were much the same at Iconium, whether he and Barnabas bethought themselves when expelled from Antiochene territory previously, or after being scourged by the lictors, 2 Cor. xi. 25). There, too, Jews were at the bottom of the tumult raised against the missionaries (“apostles,” xiv. 4, 14), which forced them to flee into the Lycaonian province of the region. In this district, marked by the native pre-Greek village system, they made Lystra and Derbe successively their headquarters. In the former occurred the healing of the lame man at the word of Paul (cf. Rom. x. 9; 2 Cor. xii. 12; Gal. ii. 5), with its sequel in the native worship offered to the strangers as gods manifest in human form. The story, told in a few graphic touches, sets before us Paul as the tactful missionary, meeting the needs of the simple Lycaonians with an elementary natural theology. Again his work was disturbed by Jews, this time his old foes from Antioch and Iconium, and he barely escaped death—one of those “deaths off” to which he refers in 2 Cor. xii. 23, a passage which shows how far Acts is from exhausting the tale of Paul’s hardships and dangers, either in Galatia or elsewhere (cf. xiv. 2, cf. 2 Tim. iii. 11). At Derbe, the frontier city of Galatia to the south-east, Paul was within easy reach of Tarsus, his old home. But the needs of his young converts drew him back to face fresh dangers in Lystra, Iconium and Antioch (where, however, new magistrates were now in office), in order to encourage “the disciples.” To give them the support of responsible oversight, the apostles procured the election of “elders” in each church, probably on the model of the synagogue: for Paul had a due sense of the corporate life of each local brotherhood (Rom. xii. 4 seq.), and of the value of recognized leaders and pastors (1 Thess. v. 12 seq.; 1 Cor. xvi. 15 seq.; cf. Acts xx. 17, 28). Then, passing through Pamphylia, they returned to Antioch, and reported to a church meeting “that all God had done with them, and how he had opened a door of faith unto the Gentiles.”

So ended Paul’s first missionary journey known to us in detail. It was the very first where his vocation as apostle of the Gentiles took marked effect. So far Gentile believers had been a mere minority, not essentially affecting the Jewish character and atmosphere of the Messianic Church, any more than the presence of proselytes was thought to affect Judaism even outside Palestine. But all this was menaced by the work accomplished, apparently under divine auspices, in Galatia. There uncircumcised Gentiles formed the majority of the heirs to Messianic salvation; and if expansion continued on these lines, the like would be true of the new Israel as a whole. Nay, a definite check to Jewish conversions would result from the prejudice created by a large influx of men not committed to the Law by their baptism into Christ. Now that the logic of facts was unfolding so as to jeopardize the Law and the Gospel at the same time, it was well for the Gentile converts to have a regular address which he used with minor variations in beginning his mission in any local synagogue, and this Luke has in substance preserved for us here. For its authenticity, see Sir W. M. Ramsay, op. cit. 303 seq.; compare A. Sabatier, L’Apôtre Paul (3rd ed., 1896), p. 89, for disproof of dependence on Stephen’s speech.
in toto, it could not but appear to many Jewish Christians time to reconsider the situation, and boldly deny the reality of any Gentile's portion in Messianic salvation apart from circumcision (as binding to observance of the Law). So argued the stricter section, those with Pharisaic antecedents, who boldly invaded the headquarters of the liberal mission at Antioch, and began to teach the Gentile converts that circumcision and the Law were matters of life and death to them. Paul and Barnabas took up the gage; and as the judaizers no doubt claimed that they had the Judæan Church at their back, the local church felt that the issue would have to be decided in Jerusalem itself. So they sent up Paul and Barnabas "and certain others of their number" (Acts xv. 2; contrast Gal. ii. 7 seq.) to confer with "the apostles and elders" there. That fact that Paul consented to go at all, to the seeming prejudice of his direct divine commission, is best explained by his prior understanding with "the Pillars" of the Judæan Church itself (Gal. ii. 1-10). His object was twofold: to secure in the centre of Judæco-Christianity that public vindication of Gentile freedom from "the yoke of the Law" on which he felt he could count, and at the same time to save the Church of Christ from outward schism and compromise. It was conceded, largely through the influence of Peter and James, that the good pleasure of the Holy Spirit (xv. 28), in possessing Gentile hearts, settled the question. But as to the need of considering age-long Jewish sentiment on points where divergent practice would tend to prevent Jewish Christians from recognizing Gentile believers as brethren, as well as place a needless stumbling-block between Jews and a Messianic society in which unlimited "uncleanness" was tolerated — on this compromise was possible. The compromise was proposed by James (xv. 20 seq.) and accepted by Paul. Indeed he had less to sacrifice than the other side in the concordat. For his Gentile converts had only to limit their freedom a little, in the cause of considerate love; but their Jewish brethren had to surrender a long-standing superiority conferred by divinely instituted national law. While the law of Moses was still observed by Jewish Christians, in the case of Gentile proselytes to Messianic Judaism it was to be waived, and a minimum of proselyte rules, indispensable (xv. 28) to a type of piety an essentially common to all "in Christ," taken as sufficient. Of the "abstinences" in question only that touching blood (in its two forms) was really a ritual matter, and it was one on which there was a good deal of scruple outside Judaism. The other two were obvious deductions from fundamental Christian ideas, as well as elements of proselyte piety. On the other hand, security against Gentile liberty undermining Jewish-Christian observance of the Law was felt to exist in the firmly rooted tradition of the synagogues of the Diaspora (xv. 21).

The above is only one reading of the case, though the simplest. Not a few scholars dispute that Paul could have been a party to such a concordat at all, and suppose that the letter embodying it is a fiction, probably composed by the author of Acts. Others hold that, if any such letter were ever sent, it was by James and the Jerusalem Church at a later date, without consulting Paul. In fact it was their solution of the deadlock to which interference with Peter's role in Gentile missions led in Antioch after the Jerusalem conference; but the author of Acts unhistorically fused it with the decision of that conference. Finally Harnack (Die Apostelgeschichte, 1908, pp. 188 seq.) maintains that the reference to "things staved up to the Law," noted by early Western tradition (Gal. iv. 8) for the text, and that "blood" meant originally homicide. Hence the rules had no reference to food apart from constructive idiocy. This theory—which does not remove the contradiction with Gal. ii. 10, on the assumption that Paul advocated by early Western Law—seems at once virtually improbable (feeling in the East being too anti-Jewish in the sub-apostolic age to allow of such an interpolation) and historically needless.

At no point in his career does Paul's greatness appear more strikingly than now in his relations with Judaeo-Christianity. Equally above the doctrinaire temper which cannot see its favourite principle practically limited by others, and a mere opportunism which snatches at any compromise as the line of least resistance, he acted as a true missionary statesman, with his eye both on the larger future and the limiting present. As he himself obeyed the principle of loving concern for others' good by conforming to certain Jewish forms of piety (1 Cor. ix. 19 seq., 22), as being Jew by training; so he was ready to enjoin on Gentiles, short of the point of compulsion, abstinence from blood simply as a thing abhorrent to Jewish sentiment. His was the spirit of a strong man, who can afford and loves to be generous for the greater good of all. This is the key to his conduct all along, leading him to interrupt his work on two later occasions simply to keep in touch with Jerusalem by conciliatory visits, as prejudice against him recurred owing to rumours of his free conduct on his Gentile missions.

On the other hand, it was the opposite side of his character, viz. inflexible courage in defence of vital principle, that was called into action soon after, owing to Peter's visit to Antioch (the abrupt reference to which in Gal. ii. 11 probably means that the judaizers were making capital of it in Galatia). There for a time Peter fell in readily with the local custom whereby Jewish and Gentile Christians ate together. But this was more than was understood even by James to be involved in alliance of the two missions. It was one thing not to force Judaism on Gentile Christians; it was another to sanction table-fellowship between Gentile and Jewish Christians, in consideration for the former as brethren. Let Peter, said James through his friends, remember Judaean feelings as well. Such a step was in advance of their convictions; and in any case it seemed wrong to break with the sentiment of the Mother Church in Judæa for the comfort of Gentile brethren on the spot, whom they had but recently regarded as by nature "unclean." One man, however, saw further into both the logic and the expediency of the case. Paul saw that by their very reliance on Christ rather than the Law for justification, Jewish Christians had in principle set aside the Law as the divinely appointed means of righteousness: that they had virtually come down from their prerogative standing on the Law and classed themselves with "sinners of the Gentiles"; and finally that they had been led into this by Jesus the Messiah Himself. If that attitude were sinful "then was Christ the minister of sin." If righteousness depend after all on the Law, then why did Christ die? This penetrating analysis (Gal. ii. 14-21) of the implications of Christian faith was unanswerable as regards any legal observance as condition of justification. But was it not possible that the degree of sanctification to be hoped for depended, for Jews at least, upon adhering as closely as possible to the old law of holiness? This was probably the position of Peter and Barnabas and the rest, as it was certainly the theory with which the judaizers "bewitched" the Galatians converts for whose benefit Paul recounts the story (iii. 1-3). But for it too he had an answer, in his doctrine of an evangelical sanctification, homogeneous in nature and motives with the justification out of which it grows, as fruit from root (iii. 5, v. 16-26). But at Antioch he confined his protest to the vital matter of principle, the true relation of Law and the deadly danger of confusing their values and functions if both were to be treated as essential to Christian faith. Thus a higher expediency, for Jews in particular, told against the expediency alleged on the other side; while for as expediency in relation to the Gentiles, it was a matter not only of Antioch and the Jews and Gentiles there involved, but also of the Roman world and the relative numbers of potential converts from either class in it. This point is not made explicit in Gal. ii. 14 seq.; but it was probably present to Paul's mind and added to the intensity of his feeling touching the gravity of the issue.

The standpoint of the Epistle to the Galatians is of great moment in judging of its historical retrospect. What Paul had to establish in the first instance was his independence up to the date of his
The evangelization of the Galatians, which God had obviously blessed (ii. 2, 5). It is therefore natural to regard all related in chapters i.–ii., including his rebuke of Peter, as prior to that cardinal. Next the logic of the case, as well as his explicit words in i. 22 sqq., rules out the idea that Paul was already familiar with the situation and the details of his Acts xi. 30, xii. 25, between his first visit and that of Gal. i. 1 sqq. (this tells against the common view that Gal. ii. 1 sqq. = Acts xv.). Finally the reason why no explicit reference is made to the visit of Gal. ii. 1 sqq. is both clear and real. Paul's account of the Galatians on the subject, that they were those evangelized in Acts xiii., xiv., not in xvi. 6. According to the above reading of this epistle it was written in the winter of Paul's first journey to Europe, c. 51–52, say in Corinth; the winter of 52/53, say in Rome. The apostle had the "so quickly" of i. 6, but also his inability to hasten to their side (iv. 20). This last condition seems to exclude as place of writing both Antioch on the sea of the second (McGiffert) or third (Barnes) missionary journey, and Ephesus during Paul's long sojourn there. The one seeming alternative, viz. Antioch on the eve of the conference in Acts xv. (so V. Weber), is preferable only on the assumption that the epistle excludes all knowledge of this event (as the present writer formerly held).

Not long after this episode Paul proposed to Barnabas a visitation of the churches they had jointly founded. But Barnabas, perhaps feeling more than before the difference in their attitudes to the Law, made the reinstatement of John Mark as their helper a condition of his participation. To this Paul demurred on the ground that he could not be relied upon in all emergencies; and the feeling caused by this difference as to Mark's fitness was sufficient to cause Paul and Barnabas to take separate lines. Each went on his own sphere of work, Barnabas to Cyprus and Paul towards Asia Minor, and we never again read of them together, though Paul continued to refer to his old colleague in kindly terms (1 Cor. ix. 6 and Col. iv. 10). Paul found a colleague in Silas (Gal. ii. 19), who, if he could not be made the "prophet," but himself a Roman citizen (Acts xvi. 37, 39); and started, with the goodwill of the Antiochene Church, probably in summer A.D. 50. His way lay through churches of his own foundation, in one of which he found a helper to replace Mark, Timothy of Lystra, who was to be as a son to him up to the very end. Confident in the conciliatory spirit of both sides in the Concordat, and anxious to show how ready he was to consider Jewish feeling where Gentile freedom was not involved, he circumcised this young semi-Jew before taking him as his associate into regions where work would still lie largely among Jews. In a similar spirit he also commended "the resolutions" of the Concordat to the observance of his churches in Galatia, though the circular letter of the conference did not make it apply more than to those of the Syro-Cilician region.

But the immediate result of this visit was good, the secondaries were among the bitterest in Paul's life, owing to the unscrupulous action of the Galatians who, taking advantage of his absence, soon began a vigorous, but subtle, propaganda amongst his converts in this region. They represented Paul as having changed his policy in deference to the Jerusalem authorities, to the extent of allowing that the Law had some claim upon Gentile believers in the Jewish Messiah. Otherwise why were the "abstinences" enjoined? Nay, more: these had been put forward as a bare minimum of what was expedient, to judge from the practice of those same Judaean authorities. But if so, surely it must at least be necessary to full Christian piety (Gal. iii. 3; cf. Peter's conduct at Antioch), though not perhaps to a bare place in the coming kingdom. Had not Paul himself confessed the value of circumcision (v. 11) in the case of Timothy, the son of a Gentile father? As for his earlier policy, it must have been due simply to a wish to humour his converts' prejudices (i. 10), to begin with. At any rate the gospel they now brought was the authentic Apostolic Gospel, and if Paul's did differ from it, so much the worse for his gospel, since it could in no case claim to be other than derived from theirs (i. 1–9, 11 sqq.). How plausible must such a plea have seemed to inexperienced Gentile converts, "bewitching" their minds away from the central facts, Christ crucified and the free gift of the spirit through faith in Him. But how disingenuous as regards Paul's real position! Can we wonder at his indignation as he wrote in reply, and that he was goaded on to pass, in his final peroration, a counter-judgment upon their motives too sweepingly severe (vi. 12 sqq.)? In any case the gross abuse by the judges of Paul's promulgation of the "abstinences" in Galatia fully explains his contrary practice elsewhere.

Paul left his Galatian converts about autumn A.D. 50, bound for the adjacent Asia. But not even yet was he to preach there, being diverted by something in which he saw the divine hand. Such as when, on his way northwards through the Phrygian region of Galatia, he tried to enter Bithynia (where also were cities with a large Jewish element), he was again turned aside by the Spirit of Jesus (i. 17, vision in the form of Jesus, xvi. 7, cf. xviii. 9, xxii. 17). Thus his course seemed open only westwards through Mysia ("northern Asia") to the coast, which was reached at Troas, the chief port in the north-west Aegean for intercourse between Asia and Macedonia. These were but sister provinces, united by the easy pathway of the sea. Yet in sentiment and in conditions of work it was a new departure to which Paul found himself summoned, when in a night-vision "a certain Macedonian" stood as if entreating him: "Come over into Macedonia and help us." Here was the positive guidance to which two negative divine interventions had been leading up. Paul hesitated not a moment, though the idea was bolder than that of his own frustrated plan. "Straightway," in the words of Luke, "we sought to go forth into Macedonia, concluding that God had called us for to preach the Gospel unto them" (xvi. 10). So, at this crucial point in Paul's mission to the Gentiles, Luke seems to preserve the thrill of emotion which passed from the leader to his companions, by breaking out into the first person plural (see Acts, for the psychological rather than literary reason of this "we," here and later).

The new mission began at Philippi, a Roman colonia. Here the Jewish settlement, in which as usual Paul sought first to gain a footing, was a small one, consisting in the main of women—who enjoyed much freedom in Macedonia. But the normal extension of his work was cut short by an incident characteristic both of the age and of the way in which the fortunes of the Gospel were affected by the vested interests around it. The story of Paul's imprisonment, with the light it casts on his quiet mastery of any situation, is familiar in its vivid detail.

After being thus "shamefully treated" in Philippi (1 Thess. ii. 2), Paul passed on rapidly to Thessalonica, the real capital of the province and an admirable centre of influence (cf. 1 Thess. i. 8). In this great seaport there was at least one synagogue; and for three weeks he was there discussed from the scriptures the cardinal points in his message (cf. 1 Cor. xv. 3 seq.), "that it behoved the Christ to suffer and to rise again from the dead," and that accordingly "this Jesus . . . is the Christ" (xvii. 2 seq.). Some Jews believed, "and of the Godfearing Greeks" (semi-proselytes) a large number, including not a few of the leading women. There was also successful work amongst those who turned directly "from idols, to serve a God living and real" (1 Thess. i. 9). This must have occupied several weeks beyond those specified above (cf. 1 Thess. i. 11; and the material help received more than once from Philippi, Phil. iv. 16).

But Jewish jealousy was aroused particularly by the loss of their temptation and at length in alliance with the rabble of the market place, it was able once more to cut short the preachers' work among the Gentiles. The charge made against them had a serious ring, since it involved not only danger to public order

---

1 The region to which some think the Epistle to the Galatians (see xxi.) was addressed—so modifying the older "North Galatian" theory of Bishop Lightfoot and others.
but treason against the emperor (laesa majestas). Thus at Thessalonica Paul had experience of the imperial system as a rival to his gospel of the sovereignty of God and of the Person of His Christ, the true king of humanity. Yet it is

1 doubtfiul if he was thinking of this 1 when he wrote to his converts touching “the mystery of lawlessness,” working towards its final conflict with the divine principle also at work in the world. He seems in the whole passage (2 Thess. ii. 3-12) to view the empire in its positive aspect as a system of law and order rather than in its idolatry of its official head, the incarnation of worldly success and power; and he alludes to both emperor and empire (6 seq.) as the force at present restraining “the mystery of lawlessness” (ároula). This phrase itself suggests something more abnormal than the world-principle latent in paganism, such as “the apostasy” of God’s own people, the Jewish nation, as once before under Antiochus Epiphanes the prototype of “the man of lawlessness” seated in the temple of God” (v. 4), of whom the late emperor Caligula might well seem a forerunner. Even so monstrous an issue of Jewish refusal of God’s truth, in His Messiah, would be but the climax of so unhallowed an alliance as that which existed at Thessalonica between Jewish unbelief and paganism, seeing that the theme was using the very Messianic idea itself to stir up the latter against the followers of Jesus (Acts xvii. 7; cf. 1 Thess. ii. 15 seq.). Paul and Silas withdrew by night, and began work in Berea, a small city of Thessaly, in the hope of returning when excitement had subsided. But Jewish intriguers from Thessalonica stirred up the populace with the old charges, and Paul, as the prime actor, was forced to retire, first to the coast (whence he may have thought of a secret visit to Thessalonica, 1 Thess. ii. 18; cf. iii. 5), and then by sea to Athens.

At Athens he was consumed with anxiety, and sent word to Silas and Timothy to join him with fresh news about his “orphans” in the faith. While waiting, however, he felt compelled by the signs of idolatry on every hand to preach his gospel. He began discussing in the synagogue with the Jews and their circle, and also in the Agora, after the manner of the place, in informal debate with casual listeners. The scope of his doctrine, the secret of right living, was such as to attract the notice of Jews and Gentiles alike. It seemed to them a strange fugare of familiar Greek phrases and outlandish talk about a certain “Jesus” and some power associated with him styled “the Resurrection.”

To clear up this, the latest intellectual novelty of the Athenian quidnuncs, they carry him off to “the Areopagus,” probably the council,2 so called after its original place of meeting on Mars’ Hill. This body seems still to have had in some sense charge of religion and morals in Athens; and before it this itinerant “sophist” seemed most likely to make his exact position plain. A mark of authenticity is the very fruitlessness of his attempt to adapt the gospel of Jesus to Greek “wisdom.” One only of his audience, a member of the Areopagus, seems to have been seriously impressed. The real effect of the episode was upon Paul himself and his future ministry among typical Greeks.

Before Timothy’s return Paul had moved on to Corinth, where he was to win success and to find material for such experiences, both when present and absent, as developed the whole range of his powers of heart and mind, (see Corinthians, Epistles to the). Corinth was more typical of the Graeco-Roman world than any other city, centre of those visited by Paul. In addition to its large Jewish colony, it had Oriental elements of other kinds, especially mystic and ecstatic cults; and its worship of Venus under semi-oriental attributes added to the general sensuality of the moral atmosphere. Over all was a veneer of Greek intellect and polish;

2 As Sir W. M. Ramsay argues in his Cities of St Paul, pp. 425-429.

3 This is the view favoured by archaeologists like Ernst Curtius (Expositor, vii. 4. 436 seq.) and Sir W. M. Ramsay. On the whole it suits the narrative better than the view which regards the Hill of Ares simply as a good spot for one of those rhetorical “displays” in which Athenians delighted.

for in its way Corinth prided itself on its culture no less than did Athens. No wonder that Paul’s first feeling in this microcosm was one of utter impotence. It was “in weakness, and in fear, and in much trembling,” though in dogmatic faith, that he began a most fruitful ministry of a year and a half. His guiding principle was to trust solely to the moral majesty of the gospel of the Cross, declared in all simplicity as to its form (1 Cor. ii. 1 sq.), not heeding its first impression upon the Jew of intolerable humiliation, and on the Greek of utter folly (1. 18 seq.). Most gladly then would he preach in such a way that “faith should not stand in the wisdom of men, but in the power of God” (ii. 5); “that no flesh should glory before God” (i. 29). How central this was to his gospel, especially as it defined itself over against Greek self-sufficiency of intellect, may be seen from his whole conception of the “spiritual” man in his letters to Corinth (esp. 1 Cor. ii. 1-iv. 7). Before his great work there began, Paul gained two fresh fellow-workers, whose share in parts at least of his later ministry was very great, Aquila, a Jew of Pontus, and his talented wife Priscilla. Probably they were already Christians, and as they too were tent-makers Paul shared their home and their work. That he was often in the presence of Jewish circumstances is proved by his having to accept aid from Macedonia (2 Cor. vi. 9 f. Phil. ii. 13). On the arrival of Silas and Timothy from that quarter, his preaching with yet more intensity, especially to the Jews (viii. 5). A breach with the synagogue soon followed. The definite turning to the Gentiles met with much success, and Paul was encouraged by a night vision to continue in Corinth for more than a year longer. An attempt of the Jews (cf. 1 Thess. ii. 15 seq.; 2 Thess. iii. 1 seq.) to use Gallio, the new proconsul of Achaia, as a tool against him, not only failed but recoiled upon themselves.

It was during his first winter at Corinth, A.D. 51-52,3 that he wrote his earliest extant missionary letters (see above for Galatians). Paul wrote not as a theologian but as the First Missionary Letters. His gospel was always in essence the same; but the form and perspective of its presentation varied with the training, mental and moral, of his hearers or converts. It was no abstract, rigid system, presented uniformly to all. This warns us against hasty inferences from silence, in judging of Paul’s own thought as represented by any epistle, and so limits our attempt to trace progress in his letters also on our estimate of him as a man and an apostle, full of sympathy for others and asking from them only such faith as could be real to them at the time.

His Thessalonian converts had met with much social persecution. The bulk belonged to the working class (iv. 11, 2 Thess. iii. 10-12); and Paul must have endeared himself to them by sharing their lot and plying his own manual industry (Acts xviii. 3). However hard his double toil of teacher and tentmaker might be, no sordid suspicions, such as his Jewish foes were ready to suggest (1 Thess. ii. 9; 2 Thess. iii. 8), should gain any colour from his conduct. He would be to his converts as a father, and an embodiment of the new Christian ethics which he pressed upon his spiritual children as the essential “fruit of the Spirit,” and also as a demonstration of the Gospel to “them that were without” (i. 7-12; cf. i. 6, iv. 1 seq.).

The special perspective of his first two epistles is affected by the brevity of his stay at Thessalonica and the severity of persecution there. Owing to the latter fact the Pauplia, as persecution is called, bears a vindication of the church, and is as reasonably to influence conduct (v. 11), had naturally been much more stirring among them. So in these epistles he deals with it more fully than elsewhere (iv. 13 seq.); and the moral fruits of the life in the Spirit are here enjoined in a very direct manner (iv. 1-8).

We need not suppose that Paul himself or his assistants used a set of rules as elaborate as the “Two Ways” (of Life and Death)

3 This date (and so Ramsay’s chronology from this point) is confirmed by a fresh inscription showing that Gallio was proconsul from 52-53 (spring), rather than 51-52; see Expositor for May 1909, pp. 467-469.
embodied, e.g. in the Teaching of the Apostles. But to judge from these epistles (1 Thess. iv. 1 seq.; 2 Thess. ii. 13; iii. 6), and his reference to the "type of teaching" (bearing on "sin, unto death," and "obedience, unto righteousness") unto which the Roman Christians had been "conformed" (Rom. 13:12), Paul gave to his converts a fairly full outline of moral instruction, similar at least to that of Judaeo-Christian missionaries (note too the rather uniform lists of vices in Rom. i. 24 seq.; 1 Cor. v. 9 seq.; Gal. v. 19; Col. iii. 5; cf. E. von Dobschütz, Christian Life in the Primitive Church, app. xii.).

What was distinctive of Paul's ethical teaching was not any lack of precedent, but the manner in which he related it to his Gospel. He was more concerned with the dynamic of conduct, as to which his own experience made him the most inspiring of teachers and the greatest interpreter of the mind of Christ. The master motive on which he relied for all, was the imitation of Christ in a peculiarly inward sense. To the believer Christ was no mere external example, but was already within as the principle of his own new moral being, in virtue of the Holy Spirit indwelling as the Spirit of Christ. Here lay the secret of Paul's "power" so characteristic of the Gospel (Rom. i. 16), a power adequate to realize even the enhanced moral ideal revealed in Christ. The wonder of it was that this power annulled the moral past, giving the once vicious an equal freedom with the "virtuous." To this sovereignty, emancipating influence of Grace, Paul referred by "the flesh," and "the sons of disobedience." Paul confidently trusted his converts for "sanctification" or progressive transformation (Gal. iii. 3, v. 16 seq.) into "the image of Christ," the full actuality of the type already latent in Christian faith. Such teaching is implicit in the Thessalonian letters; but it is explicit in the Epistle to the Galatians. Here he announces in the clearest accent the secret of Christian conduct: "Walk by (the) Spirit, and desire of the flesh ye shall not fulfill." "If we live by the Spirit, by the Spirit let us also walk." "On the basis of freedom (from law as external to the conscience) were ye called; only turn not freedom into an opportunity for the flesh, but through love serve one another. For the whole Law stands fulfilled in this, Thou shalt love thy neighbour as thyself" (v. 13 seqq., 25).

Pauline Antinomianism. These are the watchwords of Paul's antinomianism, which had grown out of the soil of his own strict moral discipline, where the ethical ideal had become abstract and moral. But how would they be taken by raw Gentiles, say in Corinth, untutored to self-denial whether in the things of sense or spirit? That their egotism often perverted Paul's libertarianism into an apology for libertinism, in keeping with current habits, as well as for selfish individualism in the use of intellect or even "gifts of the Spirit," may be gathered from his letters to Corinth (see Corinthians, Epistles to the). What here concerns us, however, is the splendidly positive way in which Paul met such abuses, not by falling back upon legalism as a "safeguard" against licence, but by redefining the laws of spirituality, both in relation to God as source of spiritual gifts, and to God's people as the appointed sphere of their exercise. He does not recede from his way of teaching; he insists that they shall understand it and abide by its real obligations. But while thinking of Paul's work in Corinth, we must not consider spiritual religion as the religious and moral ideal; as the realization of his gospel and the way in which it was afterwards conceived. Side by side with the religion of the city and of the family, both of them polytheistic and utilitarian in the main, stood the "mysteries" or esoteric cults, which were sought out and participated in by the individual for the satisfaction of essentially personal religious needs. Clearly those trained by such Mysteries would be more drawn than ordinary polytheists to his gospel, with its doctrine of mystic yet real union with the divine in Christ, and would less than others find the Cross, with its message of life through death, to be folly. This being so, we shall not be surprised to find, especially at Corinth, traces of the reaction of conceptions proper to the Mysteries upon the ideas and practices of Paul's converts (cf. 1 Cor. xv. 29), and even upon the language in which he set forth his meaning to them (see ii. 6 seqq.). Whether Paul himself was influenced by such ideas, e.g. in relation to the Sacraments, is a further question as to which opinions are divided.

After some eighteen months in Corinth, Paul felt the time had come to break fresh ground now at last perhaps at Ephesus, the key to the province of Asia. With this in view he took with him his fellow-workers Priscilla and Aquila, and left them at Ephesus while he himself visited Syria for ends of his own. That these ends were of high import we may be sure, else he would not have spent on them a period of months when the door seemed already opening in Asia (Acts xviii. 10–21). Acts gives no hint as to their nature, save the statement that "he went up" from Caesarea to Jerusalem, "and saluted the church," before he went down to Antioch. But Paul's letters enable us to infer that he relied largely on this visit for counteracting rumours which represented him as an apostate from Judaism. After some stay in Antioch Paul started before autumn A.D. 53 for his third great campaign, the centre of which he had already chosen in Ephesus, where Priscilla and Aquila were helping to prepare the ground. Passing through south Galatia, where he further fortified his conquest (xviii. 23), he would reach Ephesus before winter closed in. Already his circle of helpers had gained a fresh member of great gifts, the Alexandrine Jew Apollos (q.v.), who had been brought into fuller sympathy with the Pauline gospel by Priscilla and Aquila, and who, learning from them the situation in Corinth, volunteered to try to overcome the prejudices of the Jews there (xviii. 24–28). At first Paul taught in the synagogue, until growing hostility drove him to "separate the disciples" and transfer his headquarters to "the school of Tyrannus." There was a lecture-room such as "so- phists" or "rhetors" were wont to hire for their "displays." The change was not only one of place, but also of style of discourse, his appeal now being directly to the Gentiles, who would at first regard Paul as a new lecturer on morals and religion. The influence which went forth from this centre radiated throughout the whole province of Asia, partly through visitors to Ephesus on business or for worship at its great temple, and partly through Paul's lieutenants, such as Timothy and Epaphras (Col. i. 7; iv. 13). Witness to this extensive influence is afforded both by the friendly conduct of certain "Asiarchs" at the time of the riot (xix. 31), and by the fact that Paul later wrote a circular letter to this region, the so-called Epistle to the Ephesians. This result was due not only to Paul's persuasive speech but also to deeds of power, connected with the superhuman gifts with which he felt himself to be endowed by the Spirit of God (Acts xix. 11; cf. Rom. xv. 18 seq.; 2 Cor. xii. 28). Nor can we feel Paul's full greatness unless we remember that he was tried by the searching test of supernormal psychical and physical powers operating through him, and that he came through all with an enhanced sense of the superiority of rational and moral gifts, and of love as the crown and touchstone of all, as well as with a deepened humility. That he suffered much before the final tumult, due to his success affecting the trade depended on the cult of the Ephesian Artemis is implied in his own words, "humanly speaking, I..."  

1 Yet compare "the Way" (Acts xix. 9, 23), or "the Way of the Lord" (xviii. 25) as a name for Christianity on its practical side. So Sergius Paulus was "astonished at the Teaching (didache) of the Lord," xiii. 12; cf. Tit. i. 8 seq.

2 The affirmative is maintained by the so-called Religious-Schule in particular. The more general verdict is not proven.

3 In this light his polling of his head before embarking at Cenchreae in token of a vow of special self-consecration (to be redeemed at the end of a month in Jerusalem itself; cf. Acts xx. 24) is significant, as is his keenness as to the critical nature of the visit, including danger from Jewish fanaticism during a voyage probably on the eve of a least (say Pentecost), for which he went up on his later visit (Acts xx. 16).

4 We may doubt whether Paul himself countenanced the practices by which some believed that they drew magical virtue from his person (xviii. 12). But he did perform what he, in common with his age, believed to be the exorcism of evil spirits, as the story of Scæva's sons itself implies (xix. 13 seqq.).
fought the beasts at Ephesus (1 Cor. xv. 32), which may mean that he was almost torn in pieces by mob fury. It was perhaps an occasion that Aquila and his wife risked their lives for him (Rom. xvi. 3 seq.). Indeed he lived much of his time in Ephesus as one under daily sentence of death, so constant was his danger (1 Cor. xv. 30 seq.; cf. iv. 9; 2 Cor. i. 9; iv. 9-11). But this almost unbeatable strain on his human frailty simply deepened his sense of dependent union with Jesus, both in His death and victorious life, and softened his strong nature into a wonderful gentleness and sympathy with suffering in others (2 Cor. i. 4 seq.). It is no accident that it was from the midst of his Ephesian experiences that his Hymn of Love (1 Cor. xiii. esp. 6-8a, 13) sounded forth. His own spiritual life seems to have grown in Ephesus more than at any other period since the era of his conversion.

This brings us to the most tragic episode in Paul's career, judged by his own feelings, a psychological crucifixion of which we have the vivid record in his correspondence with the Corinthian church. Reduced to its simplest terms the situation was as follows. The Corinthian church was suffering from the fermentation of ideas and ideals too heterogeneous for their powers of Christian assimilation. Paul had laid the foundation, and others had built on it with materials of varied kind and value (see CORINTHIANS). Specially dangerous was the intellectual and moral reaction of the typically Greek mind, starting from a deep-seated dualism between mind and matter, upon the facts and doctrines of the Gospel. Its issue was an exaggeration of Paul's own religious antithesis between "the flesh," and "the mind," into a metaphysical dualism, so that the conduct of the body, crudely identified with "the flesh," became a thing indifferent for the inner and higher life of the spirit illumined by the Spirit of God. There was not only divergent practice in morals and in religious usage; there was also a spirit of faction threatening to destroy the unity of church life, to which Paul attached the greatest importance. To lead them to realize their unity in Christ and in His spirit of love was the central aim of Paul's first extant letter to this church. He rises sheer above every manifestation of the sectional element in man—whether Jewish, Greek, intellectual, ritual, or ascetic—into the sphere of pure religion, the devotion of the whole personality to God and His ends, as realized once for all in Christ, the second Adam, the archetype of divine sonship. It is his enforcement of this idea, along with firm yet flexible application to the various disorders and errors at Corinth of certain other of his fundamental principles, such as the indwelling of the Holy Spirit in the individual and the community, that makes this epistle so significant for Paul's biography. Thus, while it gives a more complete picture of a Pauline church than all other sources of knowledge put together, it at the same time illustrates the rare balance of Paul's mind. But neither this letter nor the influence of Timothy (iv. 17), already on his way to Corinth with Erastus via Macedonia, on collection business (Acts xix. 22; 1 Cor. xvi. 1 seq., 10 seq.)—nor even, as some think, of Paul himself in person (2 Cor. ii. 1; xii. 14, 21; xili. 1 seq.)—brought about an understanding on certain points involving authority and the qualifications of interloping Jewish "apostles" with their claims for themselves and their insinuations as to Paul's motives (2 Cor. xii. 14-16), greatly complicated and embittered the situation on both sides.

When next the curtain rises, we gather that Paul had been forced to write a letter of protest in a tone of severity fitted for Corinth. for the sake of Paul's converts' better selves. It was in fact an ultimatum1 that Titus carried to Corinth before Paul left Ephesus, his departure hastened by the great tumult. On leaving for Macedonia he exhorted the assembled disciples, and perhaps left Timothy to check the tendencies to error which he perceived at work (xx. 1, 1 Tim. i. 3). Then starting from Miletus, the chief port in the vicinity (cf. xx. 15),—where he had to leave Trophonius, owing to sickness (2 Tim. iv. 20, probably a fragment from a brief note to Timothy written soon after)—he reached Troas. Here he intended to evangelize pending the return of Titus (1 Cor. ii. 12 seq.). But though "a door" of opportunity at once opened to him, growing anxiety as to the reception of his severe letter drove him forward to meet Titus half-way in Macedonia. There "fights without" were added to "fears within" (vii. 5), until at last his meeting with Titus brought unspeakable relief. The bulk of the Corinthian church, in deep remorse for the way in which they had wounded him who after all was their "father" in Christ (1 Cor. iv. 15), had come out clearly as loyal to him, not only in word but also in discipline on the arch offender, whose contumacious conduct (now repudiated by the church) had so grieved him, but for whom Paul is now the first to bespeak loving treatment, "lest haply he be swallowed up of excessive grief" (ii. 5 seq.; vii. 12). Accordingly in his next letter his heart overflows with gladness and affection, yet not so as to blind his clear eye to the roots of danger still remaining in the situation.

The Interloping Judaizing missionaries (iv. 4 seq., 13, 22; cf. x. 7) are still on the spot, glorifying themselves and glorifying in their welcome on the field prepared by another's toils (x. 12-18); while in the church itself there are moral abuses yet unredressed, even in their "father" (xii. 20). Paul's need (xii. 17) is essentially for confession and penitence (xiii. 1 seq.), in spite of what some might brazenly intumesc, in reliance on his not having acted summarily on his former visit, when the church as a whole was not heartily with him. Hence Paul's letter (2 Cor. xii. 1 seq.) is an act boldly (x. 5-15), if and when on his arrival he found the obedience of the majority full and complete (xii. 6). It is to prepare the way for this (xii. 10) that Paul, while recognizing in the main the church's loyal affection, writes the second part of his letter (x.-xii. 10) in so different a key, striving to complete the reaction against his foes, with their taunt as to his not daring openly to take an apostle's support from his converts (viii. 12 seq., xii. 11-18).

The Second Epistle to the Corinthians was written from Philippi or Thessalonica (ix. 2); and Timothy joins in its opening salutation. He had, it seems, been summoned to Paul's side from Ephesus by a hurried note, written after Titus's return from Corinth, in which he is informed that Erastus had remained in Corinth as city-treasurer, Rom. xvi. 13), while Paul had been deprived also of the help of Trophimus, so that Timothy was unexpectedly needed at his side (this is embedded in an alien context in 2 Tim. iv. 20, 21, see below). One reason at least for Paul's need of Timothy is suggested by the reference to Erastus (cf. Acts xix. 22), viz. the business of the great collection from his churches in Galatia, Asia, Macedonia and Achaia. This had been some time in progress and was to be carried by delegates to Jerusalem on Paul's approaching visit, from which much was hoped in connexion with the unity of Jewish and Gentile Christianity. Another may have been the labour of inspecting the churches in those parts, which now reached at least as far as, if not into, Illyricum (Rom. xv. 19). In any case it was midwinter (36) before Paul became the guest of the hospitable Gaius in Corinth (Rom. xvi. 23).

Touching the resettlement of local church affairs during Paul's three months in Corinth, we know nothing. For the general event of this period is the writing of that epistle (Rom. xvi. 20 seq.) which shows that his mind was now bent on the extension of his mission westwards to the metropolis of the empire itself. To Rome his thoughts had been turned for many a year, but he had time and again checked the impulse to visit it (Rom. xv. 22 seq.). For the city had long been occupied by the Gospel in one form or another; and it was a point of honour with him to preach "where Christ was not named," not to build on others' foundations (xv. 20). But his eye was now fixed on Spain, if not also on south Gaul. It was, then, largely as basis for his mission to the western Mediterranean that Paul viewed Rome. Yet after all Rome was not like other places: it was the focus of the world. Hence Paul could not simply pass by it (i. 11 seq.). Very tactfully does he now offer his preliminary contributions to them—"by way of reminder," at least—embellished thereto by the consciousness of a divine commission to the Gentiles, proved by what he had been enabled already to accomplish (xv. 15 seq.).

1 On the question whether this letter has been lost (as here assumed), or on the other hand has been partially preserved in 2 Cor. x.-xiii, see CORINTHIANS.
But how could Paul write at length to a community he had never visited? Not to dwell on what he might have gathered from “Pisca and Aquila,” the wonderful list of salutations by name, often with brief characterizations, proves how constant was the flow of Christian life between the capital and provincial centres like Ephesus and Corinth. But, beyond all this, there is the nature of the epistle itself as a great “tract for the times,” applicable to the general situation at Rome, but typical also of the hour as reflected in Paul’s consciousness. It has therefore a profound biographical significance for Paul himself, summing up all his thought so far, on the basis of his conversion as unfolded by his experiences as an apostle. It is his philosophy of religion and of history, the first worthy of the name, because the first deeply-based upon the conception of the unity of humanity, as related to God, its source and the determining factor in its destiny. As such it also includes in broadest outline (viii. 18 seq.) a philosophy of nature, as related to humanity, its crown and key. Thus it is in effect a universal philosophy in terms of the moral order, which Paul, like every Hebrew, regarded as the most real and significant element in the universe. At the centre of this grand survey stands the Jewish race, the chosen vessel for bearing God’s treasure for mankind during the provisional period of human history; and at its spiritual heart, in turn, Jesus, Messiah of Israel, Saviour of mankind, in whom the distinction between the special and general spheres of revelation is transcended, while the law, “the middle wall of partition” between them, is broken down by the Cross.

Into the sweep of this high argument, as it is unfolded step by step, with an organic completeness or exposition peculiar to Romans among his writings (cf. Ephesians), there is wrought not only the problem of the Jew and Gentile (still the burning question of the time), but also the stubborn paradox of the actual rejection of Israel’s Messiah by the nation as a whole. This forms a great appendix (ix.–xi.) to the more theoretic part of the Epistle, and lays bare Paul’s innermost heart, showing how truly a Jewish patriot he was. Even the categories in which he grapples, without formal success, with the problem of divine election and human responsibility, betrays the Jew, to whom the final axioms are God’s sovereignty and God’s righteousness. Further into the contents of this most characteristic writing it is not ours to go (see Romans). Suffice it to say, he who apprehends it, as the issue of a real religious experience, already knows Paul as he knew himself and cared to be known. He who masters its thought knows the Pauline theology. Some indeed assume that Paul ceased really to progress beyond the point represented by Romans, and that certain of his later writings, if they be his at all, show a certain enfeeblement of grasp upon principle. But that is to confuse once more Paul’s personal theology with the forms of instruction which experience showed him were expedient for the strengthening and development of feeble or undeveloped moral types.

Yet while the horizon of the Roman epistle was so universal in one sense, it was restricted in another. Owing to the shortening influence of the parousia hope, even Paul’s programme of a world-mission meant simply seizing certain centres of influence, to serve as earnest of Messiah’s possession of all mankind on His return to take His great power and reign. Evangelization on the farther side of the parousia was the greater part of the whole. So we gather from this very epistle, as well as from 1 Cor. xv. 23–25 (and yet more clearly from Col. i. 23). In other ways, too, the Christianity of Paul and his age was relative to the parousia, both in theory and in practice (e.g. in its “ascetic” or “other worldly” attitude to life). This difference of perspective, and the ancient view of the world of spirits operating upon human life, are the chief things to be allowed for in reading his epistles.

Thus viewing things, how eagerly Paul must have looked westwards at this time. Yet his heart turned also to Judaea, where he felt his line of march still threatened by the danger of disunion in the very Body of Christ. At all cost this must be averted. The best hope lay in a practical exhibition of Gentile sympathy with the Mother Church in Jerusalem, such as would be to it a token of the Holy Spirit as indwelling Paul’s churches. The means for such a thankoffering for benefits received ultimately from Jerusalem (Rom. xv. 27) had been collected with much patient labour, and the delegates to accompany Paul with it had already assembled at Corinth (xx. 4). Paul had intended to cross the Aegean from Corinth with his party, by the direct route to Syria. But a Jewish plot, probably to take effect on the voyage, caused him to start earlier by the longer land-route, as far as Philippi, whence, after waiting to observe the Days of the Unleavened Bread,1 he sailed to join his fellow-almoners at Troas. There is no need to follow all the stages of what follows (see Ramsay, St Paul the Traveller). But every personal touch is meant to tell, even Paul’s walk from Troas to Assos, perhaps for solitary meditation, away from the crowded ship; and all serves to heighten the feeling that it was the path to death that Paul was already treading (xx. 23). This lies too at the heart of his impressive farewell to the Ephesian elders, a discourse which gives a vivid picture of his past ministry in Ephesus. Its burden, as Luke is at pains to emphasize by his comment upon the actual parting, is that “they should behold his face no more.”

The scene was repeated at Tyre; while at Caesarea, the last stage of all, the climax was reached, in Agabus’s prophetic action and the ensuing dissuasion of all those about him. But Paul, though moved in his feelings, was not to be moved from his purpose. The party went forward, taking the precaution to secure Paul a trusty host on the road to Jerusalem in the person of Mnason, a Hellenist of Cyprus. He entered the holy city in good time to show his loyalty to the Jewish Feast of Pentecost.

He was well received by James and the elders of the church. So far scholars are agreed, since the “we” form of narrative which began again at Philippi (xx. 3), reaches to this point. But as to the historical value of what is beyond “we” reappears with the start for Rome from Caesarea, there is large diversity of opinion. The present writer, holding that “we” is no exclusive mark of the eye-witness, sees no reason to doubt the substantial accuracy of the narrative in Acts xxi. 19–xxvi.2 touching the Jewish outbreak against Paul and its sequel. Its significance for Paul’s life is fairly clear, though we are not told what acceptance the Gentile offering of loyal love met with in the Jerusalem church as a whole. But that its general effect upon the comity of the two branches of the Messianic Ecclesia was good seems implied by the serene tone of Paul’s later references to the unity of the Body (Eph. ii. 19–22; iii. 11 seq.). What does stand out clearly in Acts is that all bears on Paul’s position as between the Jewish and the Roman authorities. Here we observe a gradual shifting of the charge against him, corresponding in part to the changes of venue. The more local elements recede, and those of interest to a Roman court emerge.

To the Jewish mob he is “the man that teacheth all men everywhere against the People, and the Law, and this place; and moreover bringeth Greeks also into the Temple, and attempted to profane the Temple” (xxiv. 5 seq.). Similarly among the many and grievous “offences alleged before Festus (xxv. 7 seq.) we gather that one or more were

1 This is a valuable datum not only for Paul’s own loyalty to the usages of Jewish piety, but also for the chronology of his life, as showing he had brought Greeks also into the Temple but narrower sphere of his life than the wide range of Acts 21. The narrowest circle was that of the Temple, his primary object (see Acts 21. 27), is quite probable. Other points hardly merit notice here; see Knowling’s Testimony of St Paul, lect. xx.
"against Caesar," i.e. treason of one sort or another. Though the others weighed with a procurator like Felix (anxious to humour the Jews cheaply) sufficiently to keep Paul (in the absence of bribes) in prison for two years, it was the last class of charge that was most dangerous, especially when once the case was before the provincial court to the appeal court at Rome. The last words of Agrippa, "This man could have been set at liberty had he not appealed to Caesar," are probably recorded with a touch of tragic irony.

But what of Paul himself during the two years at Caesarea? Though he must have been in correspondence with his churches, at least through messengers, nothing more has reached us. We can only infer from epistles written later how much this period contributed to his reflective life. The outlook was indeed stimulating to thought. Near at hand Judaea was sliding rapidly down the incline of lawlessness and fanatical resentment of Roman rule, towards a catastrophe which to Paul's eye, trained by Jewish Apocalyptic to regard certain things as signs of the days of Antichrist, would seem to betoken the prelude of the Parousia itself. Then, farther afield, the growing confederacy of Messiah's churches was stepping into the place vacated by "Israel after the flesh," as the people ready for God's Messiah.

The journey to Rome calls for no detailed notice (see Ramsay, *St Paul the Traveller*). Its main interest for us is the impression of nobility, courage and power which Paul conveyed to the centurion Julius and his fellow-passengers generally; while the enthusiasm of the eyewitnesses himself visibly reaches its climax as dangerous, as judged by Paul. At least Italy is reached, and Paul is met by detachments of "brethren" from Rome, who came as far as thirty and forty miles to welcome him; "whom when Paul saw, he thanked God and took courage.

From Paul's letters, however, we gather that if he looked for sympathy from the Roman Christians, he looked largely in vain. Whilst some welcomed him as indeed a champion of the Gospel whose fearless testimony even in bonds emboldened many, including the judicial section who wished him no good, to preach Jesus more openly than before; few, if any, really showed him brotherly love or cared for the interests of Christ outside Rome that were still on his heart (Phil. i. 12-17, ii. 21). Such absorption in their own local affairs struck Paul as strangely un-Christian in spirit, and added disappointment to his irksome confinement, chained as he was by one wrist to a praetorian soldier night and day. Yet he rose above it all. Only let "Christ be magnified" in his body, even to life or death. Then should he not be ashamed, come what might.

The letter which makes us aware how things lay is Philippians, the most devotional of all his writings and the most Christlike.

**The Epistle to the Philippians.** It is the perfect expression of personal "Paulinism" in his maturer and more positive manner. It flows from his heart as joyful thanks for tokens of continued mindfulness of him recently received from his old Philippian friends through Epaphroditus, one of their number. Touched and filled with spiritual joy the more that, save for his own personal circle, love was so scant around him, he turns to comfort his friends in their sorrow for him, out of the stores of Christian consolation received through his own fresh sense of need (cf. 2 Cor. i. 3 seqq.). Rejoice in the Lord is its recurring note. Here we get the word of the hour, both for Paul and for his converts. The date of Philippians is an open question, English scholars tending to place it early, while most foreign scholars put it late in the "two years" of Acts. The present writer would place it last of those written during the first year, i.e. last of all save 2 Timothy.

Of the remaining imprisonment epistles, the beautiful little note to Philemon touching his slave Onesimus casts fresh light on Paul "the Christian gentleman," by its humour and perfect 1 That he regarded Paul as endowed with superhuman powers, both of premonition and of healing (as in Malta), is evident, even if in his mind, like that of most ancients, "the line between the miraculous and the providential quite vanishes away" — as B. W. Bacon says (Story of St Paul, p. 214) relative to xxvi. 3-5, comparing also the case of Eutychus "insensibility." But if so, why apply this to the earthquake at Philippi also? considerableness of tone. The two larger ones do not seem at first sight to reflect his personality so much as his life as the father of churches, and the way in which he extended the lines of his gospel so as to hear on problems raised by ever fresh reactions upon it of the old traditions amid which his Asian converts still lived. Both aspects really blend; for the epistles are addressed to churches which were feeling certain effects of the seeming calmity that had overtaken him whom they in some sense regarded as their founder, and aim at raising them to the writer's own higher standpoint (Eph. iii. 13, vi. 10-22; Col. ii. 1 seqq., iv. 8 seqq.). It was just here that many of his Asian converts hesitated. They did not realize the all-sufficiency of Christ in the moral sphere; and they viewed their relations with the invisible world of ultimate or heavenly realities in keeping with this fact. They traced the hand of beings belonging to the supernatural spheres in their earthly experiences of weal and woe. Hence they dreamed of supplementing what they derived from Christ by help from other spiritual beings. To judge from Colossians (see s.c.) it was largely along the lines of Jewish thought (cf. the *Testaments of the Twelve Patriarchs*), modified by Greek and what Pagan ideas, that this tendency operated. For at Colossae at least, at least inscribed in the lines of ritual rules connected with the protection of good angels against evil, Nature being caught by a sort of theosophy, probably basing itself on a legendary pondering of pre-Mosaic Bible history in particular (cf. the Pastorals), Paul does not discuss how far "guardian angels" have any function left them in view of the all-sufficiency of Christ and His Spirit for believers. He obviously (Eph. vi. 11 seqq.) believed in the reality of angelic foes, because this hypothesis explained for him certain moral phenomena; but he had really stripped angelic helpers of all functions necessary to the Christian. Perhaps he was not sufficiently interested in the matter to think it out fully.

How does Paul deal with this situation of depressed faith and hope as to the power of Christ to confer all needful to the perfecting of the Christian's life on earth, in spite of the hostile forces, visible and invisible? All they need, he says, is to hold fast the Gospel which has already done so much for them—annulling the special privileges of the Jew, and quickening them as Gentiles "dead in sins," and under the full sway of the powers of ill, into a life of filial access to God as Father. Of Christ's ability to achieve God's purpose in all things, the wonderful progress of His Church "in all the world" is already witness (Col. i. 8, 23). Looking then to these things, visible to Christian gnosis based on spiritual experience, there is no cause for depression at the sufferings endured for Christ's sake by Christians, and least of all at his own. Both in Colossians and "Ephesians" (really a circular epistle to churches in Asia, including those of the Lycus valley and perhaps most of the Seven Churches of the Apocalypse (see Ephesians), he lays stress on "love, which is the bond of perfectness," and on "unity of the Spirit," as the atmosphere of life worthy the vocation he describes in inspiring terms.

In this respect, as in nearly every other, these epistles exhibit marked affinity with the next group claiming to come from Paul's pen, the so-called Pastoral Epistles, the ethical emphasis in which is often urged as a test of their authenticity. In both cases the development is quite natural in Paul the missionary, as it answers to growing deficits among his churches in the sphere of conduct. Such errors, while twofold in effect, alike sprang from a defective sense for ethics as the essential form of piety (1 Tim. vi. 3-11; 2 Tim. iii. 5; cf. Jas. i. 27) flowing from Christian faith. A merely intellectual faith, instead of the genuinely Pauline type, involving enthusiastic moral devotion to Christ, tended in practice either to a negative and ritual piety, as at Colossae, or to moral laxity. The latter was sometimes defended on a dualistic theory of "flesh" and "spirit," as two realms radically opposed and morally independent. 2 Of this we have a hint in the "empty words" alluded to in Eph. v. 6 (perhaps also iv. 14), probably of the same sort as in

---

1 That he regarded Paul as endowed with superhuman powers, both of premonition and of healing (as in Malta), is evident, even if in his mind, like that of most ancients, "the line between the miraculous and the providential quite vanishes away" — as B. W. Bacon says (Story of St Paul, p. 214) relative to xxvi. 3-5, comparing also the case of Eutychus "insensibility." But if so, why apply this to the earthquake at Philippi also?

2 Of this we have a hint in the "empty words" alluded to in Eph. v. 6 (perhaps also iv. 14), probably of the same sort as in
Paul meets both errors by his doctrine of the "new man," the new moral personality, God's workmanship, "created in Christ Jesus for good works" (Eph. ii. 10), whose nature it is to be fruitful unto holiness and love (cf. Gal. v. 22). In the so-called Pastoral Epistles the same subject is handled similarly, yet more summarily, as befits one writing instructions to friends familiar with the spirit behind the concrete precepts. Allowing for this, and for the special circumstances presupposed, there is no more "moralism" about the "wholesome instruction" in the Christian walk given in these epistles (1 Tim. i. 10; cf. vi. 3; 2 Tim. iv. 3) than in the other group. "Moralism" is ethical precept divorced from the Christian motive of grateful love, or connected with the notion of salvation as of "works" rather than prevenient grace. But of this there is no real trace in the Pastorals, which are a type of letter by themselves, as regards their recipients and certain of the aspects of church life with which they deal. As dealing with methods of instruction and organization, which must have occupied increasingly the attention of those responsible for the daily course of church life, they contain nothing inappropriate to the last two years of Paul's life, when he was considering how his churches might best be safeguarded from errors in thought and practice in his absence or after his decease.

The main difficulties as to their substance have been imported by anachronistic reading of them, and are falling to the ground with the progress of exegesis and knowledge of the conditions of early church life. Our real difficulties in conceiving the Pastoralas as what they purport to be, relate to their form, and lie in the field of language and expression in language. The language is that of the New Testament. But these, even as regards style and syntax, are reduced to narrow limits, when once due weight is given to the fresh analogies furnished by the now admitted Imprisonment Epistles (see also Ramsay, Epistle to Titus, 1909). This is specially the case with the use of the new words of religious import, like "Saviour" or "Deliverer" (Soter, of God and Christ: see Eph. v. 23; Phil. iii. 20)—the idea of which springs naturally from Paul's own outward state, as well as from the trials of his readers; the "washing" or "laver" of baptism (Eph. v. 26; cf. the last part of the Gospel as the "mystery" (Eph. passim, esp. "the mystery" as "great," Eph. v. 32; 1 Tim. iii. 16); and the future "appearing" of Christ (so already in 2 Thess. ii. 8; cf. Col. iii. 4). As to the use of the last term for the incarceration in 2 Tim. i. 10, it has a parallel in the "was manifested" of 1 Tim. iii. 16, itself a fragment of a Christian hymn of praise to Christ, such as is implied in Eph. v. 19, and especially Col. iii. 16. Not only is the fragment in question one in type with that in Eph. v. 14, but may even be part of the same hymn; thus, voicing common sentiments of Christian love, to weave into his epistle to Timothy the religious phraseology actually among Pauline Christians in Asia, as we see him doing in his repeated citations of the hortatory parts of their hymnology, cf. Phil. iv. 3-9 (of which Paul is said in 1 Tim. iv. 16, iv. 10; cf. 2 Tim. ii. 11 seq.). All this borrowed language, and much of the parataxis of the Asian church, helps to explain a comparative lack of the distinctly Pauline element even in letters which contain highly characteristic passages. Hence there seem no insuperable difficulties to the authenticity of all three epistles—which most scholars recognize as at least partly from Paul's pen, though they disagree as to the exact limits of the genuine fragments—if only a natural historic setting can be found for them in Paul's life. But there is a general assumption that this cannot be found within the limits allowed by Acts. Accordingly some reject the situations implied in them as on the whole unhistorical, while others postulate a later date of Paul's life, or Acts, or both, without excluding any of these alternatives. This theory of a release after the "two whole years" with which Acts closes, and of a second imprisonment before the end really came, bases itself partly on the personal notices in the Pastorals themselves (for a suggested itinerary see J. M. Cook, Paul's Journeys, 1906). But there is no evidence of any such Johnstonianism in Paul's letters, or of any particular interest in the Pastoral topics. As regards the latter, the only evidence of real weight is the reference in a highly rhetorical passage of the Epistle of Clement (c. A.D. 96) to Paul as having come in his understanding of the apostolic mind, "in the small city near the banks of the Tiber West." But, granting that Spain be meant, there is no sign that Clement thought of this visit as following on an imprisonment 1 in Rome.

1 Cor. vi. 12-14, just as the denial by Hymenaeus and Philetus in 2 Tim. ii. 16 is the denial of the first heretical exposition of verse (cf. Eph. iv. 14), finds its earlier parallel in 1 Cor. xiv. 12-34.

2 Add the fact that Clement (ch. vi.) conceives Paul as being joined in the place of reward by the Nerionian martyrs, and therefore as martyred not later than summer 64. No theory of the Pastoralas, therefore, based on Clement's witness, can place Paul's death after this date.

rather than as falling somewhere in his career, simply on the warrant of Rom. xxv. 28: while nowhere do the Pastoralas themselves point to any journey West of Rome. Further no early tradition is clear enough to override the almost certain implication of Acts (xxv. 28) and in the light of the closing chapters, and especially of xxvii. 32, 54 (which suggests that the appeal to Caesar was a fatal step) that Paul never visited Asia after his farewell at Mileteus. Accordingly room for the epistles must be found, if at all, before the spring of 62 in keeping with Acts. The following is an attempt to show how this may be done.

The pastoral epistles reveal certain special aspects of Paul's life and work in Rome during the "two years" of Acts xxviii. fin. Addressed to intimate associates, they show him in the act of caring for his churches by deputy. In the case of Titus, indeed, the churches in question were apparently not of Paul's own foundation, but those in whose welfare he had become interested while sheltering on his voyage to Rome at Fair Havens in Crete (Acts xxvii. 8 seq.). This spot was nigh to a city named Lasea; and as they were detained "a considerable time," for men eager to be gone, we may well imagine Paul coming into touch with the local Christians and leaving Titus (whose presence is never alluded to in Acts, even when proved by Paul's letters) to set in order the defective conditions prevailing among them (Tit. i. 5). Now, again, it is in connection with Timothy and Titus, and the instructions, on the basis of reports received from Titus, that is no talk of a journey to Asia, and to judge from Paul's plan to winter at Nicopolis (iii. 12) he expects his case to come on too late in autumn to admit of the visit to Asia which he had in mind only shortly before, as it seems, when referring more indefinitely to his hopes in Tit. iii. 14, iv. 13. Possibly his further reference in iii. 13 to Apollos and Zenas "the lawyer" (bearers of the letter), as on a journey of urgency, may mean that a date for his trial was fixed in the interval, and that he was sending to the East to collect counter-evidence to that of the Jews of Asia (Acts xxii. 27; cf. the later plaint in 2 Tim. i. 15, that "all in Asia" had "turned their backs on him").

Paul's appeal case was not a safe topic for correspondence (cf. Col. iv. 7 seq.), and we gather little directly on the point from his epistles. The long delay in its hearing would be due in part to the accusers' desire to collect evidence sufficient to ensure success even before a tribunal thought to be less amenable to Jewish influence than a procurator's; and, once the first unfavorable impression was conveyed, much postscript was never written. Then things for another six months. The delay seems to have been unexpected by Paul, and to have led him to mistake forecasts during his first half year in Rome, in 1 Tim., Titus and Philemon. Somewhat later he expressed himself more guardedly (Phil. ii. 23 seq.; cf. i. 25). As to the charges on which all came to turn, we are left to intrinsic probabilities. They were no doubt those serious from the Roman rather than Jewish standpoint, viz. endangering public law and order by exciting the Jews throughout the world on religious matters, and fostering treason against the imperial cult generally (cf. the charge at Thessalonica). In defence Paul would urge the privileged position of a Jewish monachist, and the Jews would be at pains to differentiate Christianity from Judaism, and so deprive it of the status of a legally recognized religion (religion licita). If they succeeded here, Paul's condemnation was only a matter of time. This is the most probable issue of the case (pace Sir W. M. Ramsay and others), both a priori and in the light of later phenomena, e.g. 1 Pet. (which in 62-63 seems to imply that the "false prophecy" had not come to pass). 1

2 Timothy, 1

Paul, there he would receive a message from Paul, possibly through Aristarchus (Acts xxxvii. 2, 5 seq.), in terms of good hope as to his appeal. Timothy would in turn send word as to the situation in Ephesus, and at the same time express his desire to hasten to Paul's side. This would lead Paul, in
sending him a letter of encouragement and specific instructions, to open with a sentence (characteristically wanting a grammatical subject) in which he recalls a personal experience, which he had exhorted Timothy to “stay on” in Ephesus 1 (i.e. in A.D. 56). Nor was the need less urgent now, owing to Judaic “fables” touching the primitive period of biblical history (“genealogies”), meant to bear on certain parts of the Law (i. 4-7) as much of universal religious validity. At Ephesus (as also in Crete) much of the same type of Judaism as was re-emerging at Colosse was reacting on local Christianity; while here and there were traces of dualistic antinomial doctrine (see i. 19 seq.; cf. 2 Tim. ii. 17 seq.). The general need of the hour was whole- 
osmane. But some Christian ethics applied all round, supported by firmer organization in church life, especially with a view to check irresponsible teaching (1 Tim. v. 17, vi. 3; Tit. i. 9-11; 2 Tim. ii. 2, iv. 3). To the special local problems Paul addresses himself in this letter, but above all to the bracing of Timothy’s somewhat sensitive nature to face the opposition which he must encounter as a Christian leader at such a time (note the similes of the soldier and athlete, both of whom face hardship readily, as part of their profession, i. 18, v. 8 sqq., vi. 12 seq.; 20; 2 Tim. ii. vii. sqq., iv. 5). In this connexion occur also certain autobiographical passages, as well as solemn affirmations of his own divine commission (e.g. i. 1, 11 sqq., ii. 7), the aim of which is to reassure his disciple that his gospel will bear all the strain that is being put upon it, or can be in the future (cf. Eph. vi. 19 seq. for all this). Here Paul is answering challenges which he knows are being made in Timothy’s hearing on every side, especially now that the apostle seemed less likely to return to Asia. He himself does not flinch, because he knows he had not run save “at the command of God” (i. 1), after being wondrously changed from his former self (i. 12 sqq.). Thus as to the authority of the Gospel “committed to his charge,” however much it may be called in question (i. 10 seq., ii. 7), he has no shadow of doubt.

When the curtain rises for the last time, it is on the morrow of the long-expected hearing of Paul’s appeal. The case stands adjourned, but he is no longer under any illusion as to its final issue. His one comfort is that by the Lord’s support he had been delivered from the greatest danger, “the mouth of the lion” ready to “swallow up” (cf. 1 Pet. v. 8) his soul through crouching fear, as he stood solitary before Caesar. From that the Lord had rescued him, and would yet rescue him from every “work of ill” (2 Tim. iv. 16-18). Yet his earthly work is done (iv. 6 seq.). So he writes to Timothy, his “beloved child,” whom now he longs to see once more. But lest this should not be granted him, he preface to the summons a last will and testament, which may help Timothy to rise above the dismay which his death at the hands of Roman law is bound to cause. Let Timothy take up the Gospel torch as it falls from his own dying hand, and “do the work of an Evangelist,” heeding not the hardship. Then after providing for the Gospel, he turns to more personal affairs.

“Hasten to me with all speed,” he urges on Titus. “For I am all alone, save for Lucas and Accius, and trusty friends are away on various business. Old Demas and Desmas has deserted the sinking ship, Tychicus I had already sent to Ephesus; he will replace you. Pick up Mark and bring him with you—he is so helpful. Bring my cloak, papers and books [copies of the Scriptures], lying in Carpus’s hands at Troas”—perhaps since Acts xx. 6 sqq. “Alexander the bronze-worker [an old Jewish foe at Ephesus. Acts xix. 33] did me many a bad turn in my case (his case is in the Lord’s hands); be on thy guard against him.” Then follow allusions to Paul’s “first defence,” unsupported by such as might have appeared on his behalf (especially from Asia; cf. i. 15); and next salutations to Prisca and Aquila, and to the house of the Beroean Christians—an Ephesian who had sought Paul out in Rome (i. 16-18).

So the curtain falls for the last time. But Paul’s fate is hardly obscure. He himself saw that the charge against him, unabated by independent evidence, must bring him to the executioner’s sword, the last penalty for a Roman citizen. With this late 2nd-century tradition agrees (Tertullian, De praescr. haer. 36), naming the very spot on the Ostian Way, marked by a martyr-memorial (tropaeum, Caius ap. Euseb. ii. 25), probably at the modern Tre Fontane, some three miles from Rome. But the traditional date (June 29) reaches us only on far later authority. Acts simply suggests the first half of A.D. 62; and we may imagine Timothy reaching Rome in time to share Paul’s last days (cf. Heb. xiii. 23).

Early Tradition has little to say about Paul. Possibly the earliest reference outside the New Testament is a Christian addition to an ancient Jewish composite work xi., which describes a ‘Benjaminite’ as “enlightening with new knowledge the Gentiles.” The notice in Clement’s epistle (ch. v.) to Paul’s having borne bonds “seven times” may be mere rhetoric (perhaps based on 2 Cor. xi. 23). The same may be said of the glimpse of Paul’s personality in martyrdom (Ad Eph. xii. 2); similarly Polycarp (Ad Phil. iii. 2) deprecates the notion that he, or any other like him, could rival “the wisdom of the blessed and glorious Paul,” and refers to his letter to the Philippians. The date assigned by Paul, complimenting Polycarp after A.D. 150 by Polycarp, in his letter to the Philippians by supplementing Luke’s story, is striking evidence of the regard felt for him in certain circles; but it contains (so far as extant in the Coptic, which also enables us to identify other documents as once parts of these Acts) no fresh data, unless the episode doubtless Paul and Thekla echo an original tradition belonging to Iconium and Pisidian Antioch. Its description of Paul as “a man small in size, bald, bow-legged, sturdy, with eyebrows meeting and a slightly protruding nose,” may be based on local memories (see 2 Cor. x. 10; cf. Dict. Christ. Antig. i. 1621, for early representations of him). The hostile conception of him lying behind the Simon of our Clementine literature (g.x.) is another matter, and a witness to the same unenviable state. Are we to be traced earlier than the 3rd century (cf. R. A. Lipsius, Die apoehr. Apostelgesch. u.s.w., and C. Clemen, Paulus, 1, 331 sqq.).

Paul’s personality is one of the most striking in history. No character in literature from past and present is known to us more fully, both from within and from without, thanks largely to the self-revealing quality of his letters. He was a deep, complex, many-sided nature, varying widely in mood, yet all so concentrated by moral unity of purpose and perspective that his every word, his every act, was a pledge of the life which he lived. During his career every faculty comes into play, and we realize how largely human he was. “Even though Paul was an apostle,” says Chrysostom, “still he was a man.” A true picture of him must be sought not only within the limits of our Acts and general sources of Paul’s personality had an universal import which must needs put him out of ordinary human perspective at certain points. Further, we must allow for his limited temporal horizon, shut in for practical purposes by a near Parousia, conceived as bringing ordinary history to an abrupt close, and the hope of which foreshadowed many issues. Bearing this in mind, we shall wonder, not so much at any other- worldly spirit or peremptoriness of tone, which were positive duties under such conditions, but rather at the sanity of temper and moral judgment. For he “only seeks and finds all things lawful,” “the powers of the coming age” (Heb. vi. 4 sqq.) were already at work in “the saints,” men possessed by the divine afflatus and made as it were but organs of the Spirit of God. Viewed in such an environ- ment, Paul’s personality is seen not as a flaw in the Christian soul, but as the normal fruit of the Spirit and the real ground of human worth (1 Cor. xiii. 1-3); insisting also that possession by the Spirit did not supersede responsibility for self-control (xiv. 32 sqq.), but on the contrary. Christ’s presence in the world (xiv. 1 sqq.). He spoke from full personal experience; for he exercised every gift on the list in 1 Cor. xii. 8. Yet with clear and ever-growing emphasis he defined spirituality in moral terms, those of the will informed by love that of Christ. How great this tradition was, no one can say. It was his balanced attitude to the operations of the Spirit—outwardly the most distinctive thing in Christianity, as compared with Judaism—an attitude at once reverent and reasonable, that saved the Church from fanaticism on the one hand.
moralism on the other. It was his own experience as a passionate seeker after righteousness which gave him the key to that reinterpretation of Jesus the Christ as at once moral ideal, master motive and immanent principle of life at work in the soul by the Spirit which was peculiarly his own and may be styled his ethical mysticism. He was also a master of detailed reasoning on his personal experience, it was bound up closely with his personality—a fact which makes his direct influence, while intense, yet rather limited in its area of appeal.

Of Paul's personal capacity he had a deep Hebrew capacity for personal devotion to the Divine as moral perfection, to an unbounded degree. It found its object in a concrete form, stirring both imagination and affections, in Jesus the Christ, "the image of the invisible God" whose spiritual glory man must apprehend as he would the ideal human person to have been diverted, even for a season, into a single human channel, in the love of woman. From his early youth his soul was preoccupied by a passion for God and His will in His people. This he came to regard as a special gift, as a gift or vocation (2 Pet. 1:10), imposing on him, in the face of the world's need (cf. 29-31), a higher duty than could be fulfilled within the conditions of the closest of human relations (32-35). But the tenderest and chivalrous self-sacrifice which found no vent in the ordinary channel came to pour itself forth in an absorbing personality of human grace, which were to him as his own spouse, though his aim was rather to "present them as a pure virgin to Christ" (2 Cor. xi. 2). This educated his human affections, and softened the outlines of a nature indubitably royal and princely, and susceptible of the transformation of the life. As he went through "the love of Christ" constraining him to look at all, as it were, through Christ's eyes, that Paul came to love men even to the point of a self-forgetfulness that seemed to some hardly sane (2 Cor. v. 13-16; cf. Matt. xvi. 18) but yet as if his vogue even for great and constant labours of body and mind. His energy indeed was portentous, as he himself felt, when he traced it to the divine power "energizing mightily" in him (1 Cor. xv. 10, Col. i. 29), and that most effectively when he felt weakest in himself (2 Cor. xi. 10).

Not only had Paul a supernatural spiritual force, marked by a rare combination of religious inspiration and reasoning power, which made him impressive both as speaker and writer, he had also a genius for adaptation to his peculiar surroundings, a Hellenistic training, but also to the fact that his message was one not of the letter but of spirit and power (cf. 2 Cor. iii. iv. 4-5). This showed itself at once in relation to individuals and special audiences, and as statesmanlike breath of skillful handling of principles so as to be instantly emerging in relation to the Jewish and Gentile types of Christianity, and again as to the attitude to the pagan state (Rom. xii. 1 sqq.). He combined grace with vital flexibility in a degree which made him the prince of missionaries. He was the prophet in the originality of his message: he was the theologian in the reflective interpretation which he gave to it, in terms derived mainly from a profound knowledge of Jewish thought, liberalized by contact with another world, the Graeco-Roman; but under Christ he was the apostle of the new order in the spirit to his gospel and to men as its subjects. There was in him something of a doctrinaire: to that, along with the legal attitude, he had been accustomed with Christ, for both belonged to the rudiments of the world of sense (1 Cor. xvii. 33 sqq. 12-15). Phil. ii. 9: "... Christ himself by his grace as an organizer of a new order among his Gentile churches, where much was left to local instinct informed by the one Spirit, while yet he jealously cared for such unity in usages as seemed needful to the exigencies of the Christian worship." (1 Cor. iv. 17, xv. 33-36).

In particular he showed his Christian largeness in his exertions to keep in communion the two sections of Christ's people, to the point of risking his life for this end.

In his epistolary writings he had the power of feeling and imparting the friendship of the noblest order, a comradship in Christ which fills his letters with delightful touches of loyal affection and trust, even of playfulness on occasion (Philm. i). He was a man of heart, with rapid alternations of mood, with powers of endurance.
to reproduce the Pauline "system" as a whole, it is best to take the form in which it appears in the Epistle to the Romans, and then supplement it with the slight additional material in Galatians. It is not really to be in terms of the writer's thought, rather than his readers'), instead of constructing an

amalgam from the whole range of his epistles taken prosaically. Paulinism, in the widest sense, includes much that is not distinctively his at all; what can here be given is confined to Paul's specific contribution to Christianity.

1. Paulinism proper springs from an absorbing passion for a righteousness real from the heart outwards, real before God. This could not be satisfied by "works of the Law," i.e. deeds prompted by the categorical imperative of Law, itself viewed as the will of God and supported by sanctions of reward and penalty. Two things hindered; by God's righteousness, confined to the Law, and by the latent pride, hindered; by God's righteousness, confined to the Law, and by the latent pride,

hindered; by God's righteousness, confined to the Law, and by the latent pride,

Thus the main effect of Law was negative; it brought to light the sin latent in the flesh, i.e. the personality as conditioned by the post-Adamic condition. This is not a moral dynamic, but a divine interposition or redemption, achieving at once reconciliation and regeneration by the removal of guilt and the creation of a new moral dynamic. Justification, then, or the placing of man in a state of grace, is not the act of God which secures him as a "grace" apart altogether from "works of law" and their desert. The medium of such grace was the Christ, in whom the claims of the dispensation of Law, in its typical form as the Jewish Torah, were satisfied. The essential breakthrough in the dispensation of Law is the approval upon Christ's fulfillment of righteousness (Rom. v. 17-19; I Cor. xvi. 17) on the new and higher plane of filial obedience by love to God as Father.

The Law of God could not do, in its weakness in relation to the flesh, which had been divinely achieved by God's Son, the Messiah, in virtue of the "Spirit of life" in Him, which annulled "sin and death" in human nature (Rom. vii. 2-4), first in the flesh of Christ, and its effects transmitted to all men through his humanity, but the flesh could not be united to Him as spiritual Head (I Cor. iv. 35). This union was affected by faith, a profound receptivity whereby the personality of the Saviour became as it were the germ of the new moral personality of the believer. He was "in Christ" and Christ "in him" by a mutual spiritual interpenetration, begun on Christ's side by various self-sacrificing love, and consummated on the believer's side by self-surrendering trust under the influence of the Spirit of God and Christ (Gal. ii. 20; Rom. viii. 9, 15 seq).

2. Such mystic union by faith (cf. Eph. iii. 16-19) is the very nerve of Paulinism, having two main aspects. In its initial aspect, it is the real basis of justification (as radical sanctification) and regeneration; in its abiding aspect, it is the condition of progressive sanctification and assimilation to Christ, Himself, the "image of God." To the one aspect corresponds the initial rite of baptism; to the other the recurring rite of communion in the Lord's Supper. These have both an essentially corporate significance. It is the rhythm of the mystic consciousness of the interpenetration of the personality of Christ the Head and of His Body the Church—that believers, already united to the Head by faith, partake in these sacraments (I Cor. xii. 13 seq. x. 16 seq).

3. The feeling of the Christ of God, the glorified Christ, who appeared to Paul at his conversion, and in the rays of whose heavenly glory the earthly life of Jesus of Nazareth was ever seen. Here, as elsewhere, the mode of Paul's conversion determined his whole perspective. It did not modify his opinion regarding Christ, Himself, the "image of God." To the one aspect corresponds the initial rite of baptism; to the other the recurring rite of communion in the Lord's Supper. These have both an essentially corporate significance. It is the rhythm of the mystic consciousness of the interpenetration of the personality of Christ the Head and of His Body the Church—that believers, already united to the Head by faith, partake in these sacraments (I Cor. xii. 13 seq. x. 16 seq).

4. The feeling of the Christ of God, the glorified Christ, who appeared to Paul at his conversion, and in the rays of whose heavenly glory the earthly life of Jesus of Nazareth was ever seen. Here, as elsewhere, the mode of Paul's conversion determined his whole perspective. It did not modify his opinion regarding Christ, Himself, the "image of God." To the one aspect corresponds the initial rite of baptism; to the other the recurring rite of communion in the Lord's Supper. These have both an essentially corporate significance. It is the rhythm of the mystic consciousness of the interpenetration of the personality of Christ the Head and of His Body the Church—that believers, already united to the Head by faith, partake in these sacraments (I Cor. xii. 13 seq. x. 16 seq).

5. The feeling of the Christ of God, the glorified Christ, who appeared to Paul at his conversion, and in the rays of whose heavenly glory the earthly life of Jesus of Nazareth was ever seen. Here, as elsewhere, the mode of Paul's conversion determined his whole perspective. It did not modify his opinion regarding Christ, Himself, the "image of God." To the one aspect corresponds the initial rite of baptism; to the other the recurring rite of communion in the Lord's Supper. These have both an essentially corporate significance. It is the rhythm of the mystic consciousness of the interpenetration of the personality of Christ the Head and of His Body the Church—that believers, already united to the Head by faith, partake in these sacraments (I Cor. xii. 13 seq. x. 16 seq).

The doctrine of the Father in the Son is brought down to the present life of righteousness enjoyed by believers through the "first-fruits of the Spirit" in them. Here lay his great advantage in Judeo-Christianity, with its preponderant eschatological emphasis. In the apostle's view, a mode of mediation, that of the Messiah, and of regression to Him. To this mode of thought Christ was not the very principle of the new filial righteousness. In a word, while Judeo-Christianity only implicitly or transcendentally transcended legalism, Paulinism did so explicitly and consistently, thus safeguarding the future. For Paul's religion was Christocentric in a sense unknown before. Compared with this, his distinctive attitude of soul to Christ, the exact metaphysical conception he formed of Christ's pre-existence was secondary and conditioned by his consciousness of Christ's complete religious efficacy, which marked Him as essentially Divine, the Son of God in the highest sense conceivable under human conditions.

6. Thus Paulinism "Christocentric," one raises the question as to its relation to the Gospel proclaimed by Jesus. That Paul conceived himself as utterly dependent for his gospel upon Jesus the Christ, is not in doubt, but only how far he could be said to have been "inspired" by him, as the object of its matter rather than its revealer. In one aspect this is but the question as to Paul's attitude to the historic Jesus over again: yet it is more. Granting that Paul felt his gospel to be in essential agreement with the words and deeds of Jesus of Nazareth, as known to him, should it not imply a certain critical view of Jesus as a figure of the past, as not necessarily the basis of his gospel? Or rather should it not involve a fresh perspective as to change the relative emphasis on points central to the teaching of Jesus, and so alter its spirit. A school of writers, by no means unappreciative of Paul as they understand him, of whom e.g. B. Spalding may be taken as an example, answer that Paul so changed Christianity as to become its "second founder"—the real founder of ecclesiastical Christianity as distinct from the Christianity of Jesus. They say, "either Jesus or Paul: it cannot be both at the same time." This is a great error. Paul in fact maintains a mythological"conceptions, by its view of sin, of redemption and of the pre-existent celestial person of the Redeemer; but also that, apart from the Rabbinic and anti-Rabbinic element in Paul, his outlook throughout is profoundly influenced by the "theocratic" or "older" Paulinism of his Judaism. Thus his "Theocentric," if only Christ be regarded as the revealer of God the Father, and that in virtue of a special community of nature with Him as Son. It may be questioned whether Paul attained, or indeed had within his reach in that age, the best intellectual equivalent of his religious intuition of Christ as mediator between God and man. But it is another matter to question whether his intuition that the personality of the Christ Himself was the secret of the message makes the Pauline idea of the redemptive action of the Gospel as it appears even in the Synoptics. Thus the Paulinist is led to come rather with those who see in Paul Jesus's most genuine disciple (H. Weinig), the one who best understood and reproduced His inner meaning. Jesus is seen through the sinless consciousness of the Saviour, while Paul's is that of a conscious sinner. But that is the perspective in which mankind generally has to view the Gospel; and apart from the special intensity of Paulinism, experience of sin, the Gospel as it "found" him must surely be in no case a mere instrumental element of the Gospel as set forth in more ideal form by Jesus Himself. By restoring Jesus's own stress upon "eternal life" as present rather than future, and that on lines other than those of obedience as the condition of receiving it, Paulinism was still firmly rooted in the eternal and spiritual religion of which Jesus had found inspired His personal disciples, but which they had not been able to grasp.

No doubt there is another side to all this, the side of Paul's idioms and modes of expression which are often a delicate form of Paul's religious experience, especially as regards sin, as if almost an external form of Paul's religious experience, especially as regards sin, has proved a limitation to His direct and full influence. While numberless men have discovered themselves in reading Paul, many have shut their eyes to the religious appeal of his writings, not a few have gravely misunderstood the theocratic setting of his message. Indeed misunderstanding, one way or another, was Paul's usual lot in the ancient Church.5 To what extent has this effect on the form of Christianity in which some of those ideas were couched? But to say this is little more than saying that Paulinism is a less universal form of the Gospel than that given by his Master Jesus Christ. To do full justice to the whole history of Christianity is to prove that the personality of Jesus has counted for more in producing Christians than his teaching per se, that is, his Gospel in the narrower sense. And it was Paul, not the older apostles, who first concentrated attention on that personality as the type and pledge of man's potential sonship to God.
to Paulinism in this respect, we must compare it with other interpretations of Jesus and His Gospel in the age immediately ensuing. At the one extreme stands Juttaeus-Christianity (so far as uninfluenced by Paul), with its ultra-conservatism and undeveloped spirituality; at the other Gnosticism, with its dualism, born of a rigid dualism and defective sense for historical continuity in revelation. Between these stands Paul, blending the positive ideas of both in a religious unity of immense ethical power and initiative; while the other and intermediate types represent memoriable theses and the Johannine writings—all testify to his pervasive influence.

**LITERATURE.**—For this in anything like its immense range, reference may be made to the articles “Paul” in Hastings’s *Dict. Bible*, the Encyc. Bibl., A. Hauck’s *Realeencyklopädie* (Zahn) to R. J. KNOWING’s *Greek Grammar* (1862 and 1892), for the spirituality, born of a rigid dualism and defective sense for historical continuity in revelation. Between these stands Paul, blending the positive ideas of both in a religious unity of immense ethical power and initiative; while the other and intermediate types represent memorable theses and the Johannine writings—all testify to his pervasive influence.

Zeitalter (1851; 3rd ed., 1885); Eng. trans. 1886; E. Renan (1869); T. Lewin (1851, 1874, rich in archaeology); Conbye and Howson (1852 and later); H. Ewald, History of Israel (vol. vi., 3rd ed., 1868; M. Krenkel (1851); A. Haussart (2nd ed., 1877); W. Farrar in *Les Arts, ii.* (1876); K. Schmidt, Die Apostelgesch. (vol. i., 1882); C. Weizsäcker, Das apost. Zeitalter (1886; Eng. trans., 1894); W. M. Ramsay, *St Paul the Traveller and Roman Citizen* (1886); A. C. McGregor, *The Apostolic Age* (1897); O. C. O. (1898); C. Conolly, *St Paul* (1895); W. Bacon (1903). Some of these deal largely with Paul’s teaching.

**PAUL (PAULUS), the name of five popes.**

Paul I., pope from 757 to 767, succeeded his brother Stephen III. on the 29th of May 757. His pontificate was chiefly remarkable for his close alliance with Pippin, king of the Franks, to whom he made a present of books highly significant of the intellectual poverty of the times; and for his unsuccessful endeavours to effect a reconciliation with the iconoclastic emperor of the East, Constantine Copronymus. He died on the 28th of June 767. His successor was Stephen IV.

Paul II. (Pietro Barbo), pope from the 30th of August 1464 to the 26th of July 1471, was born at Venice in 1417. Intended for a business career, he took orders during the pontificate of his uncle, Eugenius IV., and was appointed successively librarian of the papal chancery, bishop of Cervia, patron of the Roman Church, and in 1440 cardinal-deacon of Sta. Maria Nova. He was made cardinal-priest of Sta. Cecilia, then of St. Marco by Nicholas V., was a favourite of Calixtus III., and was unanimously and unexpectedly elected the successor of Pius II. He immediately declared that election "capitulations," which cardinals had long been in the habit of affirming as rules of conduct for future popes, could affect a new pope only as counsels, not as binding obligations. He opposed with some success the domineering policy of the Venetian government in Italian affairs. His repeated condemnations of the Pragmatic Sanction of Bourges resulted in strained relations with Louis XI. of France. He pronounced excommunication and deposition against King George Podiebrad on the 23rd of December 1466 for refusal to enforce the Basil agreement against the Utraquists, and prevailed on Matthias Corvinus, king of Hungary, to declare war against him on the 31st of March 1468. Matthias was not particularly successful, but George Podiebrad died on the 2nd of March 1471. The pope carried on fruitless negotiations (1469) with the emperor Frederick III. for a crusade against the Turks. Paul endeavoured to make drastic reforms in the curia, and abolished the college of abbreviators (1466), but this called forth violent protests from the cardinal Platina, one of their number and subsequently librarian under Sixtus IV., who is responsible for the fiction that Paul was an illegitimate successor of learning. It is true that the pope suppressed the Roman academy, but of religious grounds. On the other hand he was friendly to Christian scholars; he restored many ancient monuments; made a magnificent collection of antiquities and works of art; built the Palazzo di St. Marco, now the Palazzo di Venezia; and probably first introduced printing into Rome. Paul embellished the costume of the cardinals, collected jewels for his own adornment, provided games and food for the Roman people and practically instituted the carnival. He began in 1469 a revision of the Roman breviary, which was completed (1505) by Gregory XII., and used by the popes until 1490. Paul established the special tax called the quin decimum in 1479, and by bull of the same year (April 19) announced the jubilee for every twenty-five years. He began negotiations with Ivan III. for the union of the Russian Church with the Roman see. Paul was undoubtedly not a man of quick parts or unusual views, but he was handsome, attractive, strong-willed, and has never been accused of promoting nephews or favourites. He died very suddenly, probably of apoplexy, on the 26th of July, 1471, and was succeeded by Sixtus IV.

**PAUL III.** (Alessandro Farnese), pope from 1534 to 1549, was born on the 28th of February 1468, of an old and distinguished family. As a pupil of the famous Pomponius Laetus, and, subsequently, as a member of the circle of Cosmo de’ Medici he received a finished education. From Florence he passed to Rome, and became the father of at least two children, later legitimized. Upon entering the service of the Church, however, he lived more circumspectly. His advancement was rapid. To the liaison between his sister Giulia Farnese Orsini and Alexander VI., he owed his cardinal’s hat; but the steady favour which he enjoyed under successive popes was due to his own cleverness and capacity for affairs. His election to the papacy, on the 13th of October 1534, to succeed Clement VII., was virtuously without opposition.

The pontificate of Paul III. forms a turning-point in the history of the papacy. The situation at his accession was grave and complex; the steady growth of Protestantism, the irrepressible power of the emperor, the prolonged wars with France, the advances of the Turks, the uncertain mind of the Church itself—all conspired to produce a problem involved and delicate. Paul was shrewd, calculating, tenacious; but on the other hand over-cautious, and inclined rather to temporize than to strike at the critical moment. His instincts and ambitions were those of a secular prince of the Renaissance; but circumstances forced him to become the patron of reform. By the promotion to the cardinalate of such men as Contarini, Caraffa, Pole and Morone, and the appointment of a commission to report upon existing evils and their remedy, the way was opened for reform; while by the introduction of the Inquisition
PAUL (POPEs)

into Italy (1542), the establishment of the censorship and the Index (1545), and the approval of the Society of Jesus (1540), most efficient agencies were set on foot for combating heresy.

But in the matter of a general council, so urgently desired by the emperor, Paul showed himself irresolute and procrastinating. Finally on the 13th of December 1545 the Council assembled in Trent; but when the victories of Charles V. seemed to threaten its independence it was transferred to Bologna (March 1547) and not long afterwards suspended (Sept. 1549). He concluded the truce of Nice (1538) between Charles and Francis, and contracted an alliance with each. But the peace of Crespy and the emperor's negotiations with the Protestants (1544) turned him against Charles, and he was suspected of desiring his defeat in the Schmalkaldic War. The most deplorable weakness of Paul was his nepotism. Parma and Piacenza, States of the Church, he bestowed upon his natural son Pier Luigi (1543). But in 1549 Pier Luigi was assassinated by his outraged subjects, and the emperor thereupon claimed the two dukies for his son-in-law Ottavio Farnese, Paul's grandson. This led to a family quarrel which greatly embittered the last days of the pope and hastened his death (Nov. 10, 1549). Parma and Piacenza continued to be a bone of contention for two hundred and fifty years.

Paul was gifted and cultured, a lover and patron of art. He began the famous Farnese Palace; constructed the Sala Regia in the Vatican; commissioned Michelangelo to paint the "Last Judgment," and to resume work upon St Peter's; and otherwise adorned the city. Easy-going, luxurious, worldly-minded, Paul was not in full sympathy with the prevailing influences about him. See Panvinio, continuator of Platina, De vita pontif. rom.; Ciacionius, Vita et res gestae summorum pontif. rom. (Rome, 1601-1602, both contemporaries of Paul III.); Quirini, Imago opisth. pontif. expressa in gestis Pauli III. (Brixen, 1745); Ranke, Popes (Eng. trans. by Austin), i. 234 seq. v. Reumont, Gesch. der Stadt Rom., iii. 2, 471 seq., 716 seq.; Brosch, Gesch. des Kirchenstaates (1880), i. 133 seq., Ehres, "Kirchliche Reformarbeiten unter Paul III. vor dem Trienter Konzil," Rom. Quaest. scrip. (1901), xv. 155 seq., also Politica di papa Paolo III, et Italia (Camerino, 1901); and also the extensive bibliography in Herzog-Hauck, Realencyklopaedie, s.v. "Paul III."

PAUL IV. (Giovanni Pietro Carafa), pope from 1555 to 1559, was born on the 28th of June 1476, of a noble Neapolitan family. His ecclesiastical preferment he owed to the influence of an uncle, Cardinal Oliviero Carafa. Having filled the post of nuncio in England and Spain, he served successive popes as adviser in matters pertaining to heresy and reform. But he resigned his benefices, and, in conjunction with Cajetan, founded the order of the Theatines (1524) with the object of promoting pious and of combating heresy by preaching. In 1536 Paul III. made him cardinal-archbishop of Naples and a member of the reform commission. After the failure of Contarini's attempt at reconciliation with the Protestants (1541) the papacy committed itself to the reaction advocated by Carafa; the Inquisition and censorship were set up (1542, 1543), and the extermination of heresy in Italy undertaken with vigour. Elected pope, on the 23rd of May 1555, in the face of the veto of the emperor, Paul regarded his elevation as the work of God. With his defects of temper, his violent antipathies, his extravagant notion of papal prerogative, his pontificate was filled with strife. Blinded by ungovernable hatred he joined with France (1555) in order to drive the "accursed Spaniards" from Italy. But the victory of Philip II. at St Quentin (1557) and the threatening advance of Alva upon Rome enabled Paul to come to terms and to abandon his French alliance. He denounced the terms of Augsburg as a pact with heresy; nor would he recognize the abdication of Charles V. and the election of Ferdinand. By insisting upon the restitution of the confiscated church-lands, assuming to regard England as a papal fief, requiring Elizabeth, whose legitimacy he aspired to, to submit her claims to him, he raised insuperable obstacles to the return of England to the Church of Rome.

Paul's attitude towards nepotism was at variance with his character as a reformer. An unworthy nephew, Carlo Carafa, was made cardinal, and other relatives were invested with the dukies of Palliano and Montebello. It was Paul's hope in this way to acquire a support in his war with the Spaniards. But the defeat of his project with Philip II., and, he turned to reform. A stricter life was introduced into the papal court; the regular observance of the services of the Church was enjoined; many of the grosser abuses were prohibited. These measures only increased Paul's unpopularity, so that when he died, on the 18th of August 1559, the Romans vented their hatred by demolishing his statue, liberating the prisoners of the Inquisition, and scattering its papers. Paul's talent of political wisdom, and his ignorance of human nature aroused antagonisms fatal to the success of his cause.

See Panvinio, continuator of Platina, De vita pontif. rom.; Ciacionius, Vita et res gestae summorum pontif. rom. (Rome, 1601-1602, both contemporaries of Paul IV.); Caraccioli, Vita Pauli IV. P.M. (Cologne, 1612; for criticism see Histoires ecclésiastiques, xiv. 450 seq.), whose rich collection of materials was used by Miller, De vita et regibus di Paolo IV. (Ravenna, 1748), and Stat, Une Question ital. au seizième siècle (Paris, 1861). See also Castaldo, Vita del pontifice Paolo Quarto (Modena, 1618); Ranke, Popes (Eng. trans. by Austin), i. 266 seq. (an excellent sketch); v. Reumont, Gesch. der Stadt Rom., iii. 2, 513 seq., and Bouhagg, "G. P. Caïfa u. d. reformatorische Bewegung seiner Zeit," in Jahrb. für prot. Theol. (1878), vol. i.; Angel, Disgrace et proès des Carafa (1909); Kiss, Politik Pauls IV. (1909).

PAUL V. (Camillo Borghese), successor of Leo XI., was born in Rome on the 17th of September 1552, of a noble family. He studied in Perugia and Padua, became a canon lawyer, and was vice-legate in Bologna. As a reward of a successful mission to Spain Clement VIII. made him cardinal (1556) and later vicar in Rome at the instance of Eleonora of Aragon. On the 16th of May 1565, his extreme conception of papal prerogative, his arrogance and obstinacy, his perverse insistence upon the theoretical and disregard of the actual, made strife inevitable. He provoked disputes with the Italian states over ecclesiastical rights. Savoy, Genoa, Tuscany and Naples, wishing to avoid a rupture, yielded; but Venice resisted. The republic stood upon her right to judge all her subjects, and by her demands touching benefices, titles and papal bulls showed her determination to be supreme in her own territory. Excommunication and interdict (April 17, 1660) were met with defiance. The cause of the republic was brilliantly advocated by Fra Paolo Sarpi, counsellor of state; the defenders of the papal theory were Cardinals Baronius and Bellarmine. The pope talked of coercion by arms; but Spain, to whom he looked for support, refused to be drawn into war and the quarrel was finally settled by the mediation of France (March 23, 1672). Notwithstanding certain concessions, the victory remained with the republic (see Sarri).

Paul became involved in a quarrel with England also. After the Gunpowder Plot parliament required a new oath of allegiance to the king and a denial of the right of the pope to depose or release his subjects from their obedience. Paul forbade Roman Catholics to take the oath; but to no purpose, beyond stirring up a literary controversy. By his condemnation of Gallicanism (1613) Paul angered France, and provoked the defiant declaration of the states general of 1614 that the king held his crown from God alone.

Paul encouraged missions, confirmed many new congregations and brotherhoods, authorized a new version of the Ritual, and canonized Carlo Borromeo. His devotion to the interests of his family exceeded all bounds, and they became immensely wealthy. Paul began the famous Villa Borghese; enlarged the Quirinal and Vatican; completed the nave, façade and portico of St Peter's; erected the Borghese Chapel in Sta Maria Maggiore; and restored the aqueduct of Augustus and Trajan ("Acqua Paolina"). He also added to the Vatican library, and began a collection of antiquities. Paul died on the 28th of January 1621, and was succeeded by Gregory XV.

See Bzovius (Bzowski), De vita Pauli V. (Rome, 1625; contained in Platina, De vita pontif. rom., ed. 1626), who depicts Paul as a paragon of all public and private virtues; Vitorelli, continuator of Ciacionius, Vita et res gestae summorum pontif. rom. (a contemporary of the pope); Goujet, Histoire du pontificat de Paul V.,
to omnipotence drove him below the line of insanity. His conduct of the foreign affairs of Russia plunged the country first into the second coalition against France in 1798, and then into the armed neutrality against Great Britain in 1801. In both cases he acted on personal pique, quarrelling with France because he took a sentimental interest in the Order of Malta, and with England because he was flattered by Napoleon. But his political follies might have been condoned. What was unpardonable was that he treated the people about him like a shah, or one of the craziest of the Roman emperors. He began by repealing Catherine's law which exempted the free classes of the population of Russia from corporal punishment and mutilation. Nobody could feel himself safe from exile or brutal ill-treatment at any moment. If Russia had possessed any political institution except the tsardom he would have been put under restraint. But the country was not sufficiently civilized to deal with Paul as the Portuguese had dealt with Alphonso VI., a worse person, in 1667. In Russia as in medieval Europe there was no safe prison for a deposed ruler. A conspiracy was organized, some months before it was executed, by Counts Pahlen and Panin, and a half-Spanish, half-Neapolitan adventurer, Admiral Ribas. The death of Ribas delayed the execution. On the night of the 11th of March 1801 Paul was murdered in his bedroom in the St Michael Palace by a band of dismissed officers headed by General Bennigsen, a Hanoverian in the Russian service. They burst into his bedroom after supper together and when flushed with drink. The conspirators forced him to the table, and tried to compel him to sign his abdication. Paul offered some resistance, and one of the assassins struck him with a sword, and he was then strangled and trampled to death. He was succeeded by his son, the emperor Alexander I., who was actually in the palace, and to whom Nicholas Zubov, one of the assassins, announced his accession.

See, for Paul's early life, K. Wallawetzki, Autour d'un trône (Paris, 1894), or the English translation, The Story of a Throne (London, 1895), and P. Morane, Paul I. de Russie avant l'événement de 1801 (Paris, 1907). For an account of the empire, see I. Schiemann, Geschichte Russlands unter Nikolaus I. (Berlin, 1904), vol. i. and Die Ernordung Pauls, by the same author (Berlin, 1902).

PAUL OF SAMOSATA, patriarch of Antioch (260–272), was, if we may credit the encyclical letter of his ecclesiastical opponents preserved in Eusebius's History, bk. vii. ch. 30, of humble origin. He was certainly born farther east at Samosata, and may have owed his promotion in the Church to Zenobia, queen of Palmyra. The letter just mentioned is the only indisputably contemporary document concerning him and was addressed to Dionysius and Maximus, respectively bishops of Rome and Alexandria, by seventy bishops, priests and deacons, who attended a synod at Antioch in 269 and deposed Paul. Their sentence, however, did not take effect until late in 272, when the emperor Aurelián, having defeated Zenobia and anxious to impose upon Syria the dogmatic system fashionable in Rome, deposed Paul and allowed the rival candidat Donius to take his place and emoluments. Thus it was a pagan emperor who in this momentous dispute ultimately determined what was orthodox and what was not; and the advanced Christology to which he gave his preference has ever since been upheld as the official orthodoxy of the Church. Aurelián's policy moreover was in effect a recognition of the Roman bishop's pretension to be arbiter for the whole Church in matters of faith and dogma.

Scholars will pay little heed to the charges of rapacity, extortion, pomp and luxury made against Paul by the authors of this letter. It also accuses him not only of consorting with women at his palaces and at court, but of allowing his presbyters and deacons also to contract platonic unions with Christian ladies. No actual lapses however from chastity are alleged, and it is only complained that suspicions were aroused, apparently among the pagans.

The real gravamen against Paul seems to have been that he clung to a Christology which was become archaic and had in Rome and Alexandria already fallen into the background.
PAULDING—PAULET

Paul’s heresy lay principally in his insistence on the genuine humanity of Jesus of Nazareth, in contrast with the rising orthodoxy which merged his human consciousness in the divine Logos. It is best to give Paul’s beliefs in his own words; and the following sentences are translated from Paul’s Dis- courses to Sabinus, of which fragments are preserved in a work against heresies ascribed to Anastasius, and printed by Angelo Mai:

I. “Having been anointed by the Holy Spirit he received the title of the anointed (i.e. Christos), suffering in accordance with his nature, working wonders in accordance with grace. For in the holiness and divinity of his nature he is confirmed to himself, and the gift of the Holy Spirit was bestowed upon him. He was empowered to grasp as it were the power and authority of wonders. By these means he was shown to possess over and above the will, and the same activity (with God), and won the title of Redeemer and Saviour of our race.”

II. “The Saviour became holy and just; and by struggle and hard work overcame the sins of our forefather. By these means he succeeded in perfecting himself, and was through his moral excellence united with God; having attained to unity and sameness of will and energy (i.e. activity) with Him through his advances in the path of good deeds. This will be preserved inseparably (from the Divine), and so inherited the name which is above all names, the name of the Saviour and the Anointed in grace to his glory.”

III. “The different natures and the different persons admit of union in one way only, namely in the way of a complete agreement in respect of will; and thereby is revealed the One (or Monad) in activity, in the case of those (wills) which have coalesced in the manner described.”

IV. “We do not award praise to beings which submit merely in virtue of their nature; but we do award high praise to beings who have conformed, although it afterwards became so sub-

mitting because their inspiring motive is one and the same, they are confirmed and strengthened by one and the same indwelling power, of which the force ever grows, so that it never ceases to stir. It was in virtue of this that the Saviour conformed to God, so as to admit of no divorce from Him, but for all ages to retain one and the same will and activity with Him, an activity perpetually at work in the manifestation of good.”

V. “The Saviour is the same will with God. For as nature manifests the substance of the many to subsist as one and the same, so the attitude of love produces in the many an unity and sameness of will which is manifest by unity and sameness of approval and well-pleasingness.”

From other fairly attested sources we infer that Paul regarded the baptism as a landmark indicative of a great stage in the moral advance of Jesus. But it was a man and not the divine Logos which was born of Mary. Jesus was a man who came to be God, rather than God become man. Paul’s Christology therefore is essentially descriptive, and among the principal Ebonite Christians of Judaea, in Hermas, Theodotus and Artemon of Rome, and in Archelaus the opponent of Mani, and in the other great doctors of the Syrian Church of the 4th and 5th centuries. Lucian the great exegete of Antioch and his school derived their inspiration from Paul, and he was through Lucian a forefather of Arianism. Probably the Paulicians of Armenia continued his tradition, and hence their name (see PAULICIANS).

Paul of Samosata represented the high-water mark of Christian speculation; and it is deplorable that the fanaticism of his own and of succeeding generations has left us nothing but a few scattered fragments of his writings. Already at the Council of Nicea in 325 the Pauliani were put outside the Church and condemned to be rebaptized. It is interesting to note that at the synod of Antioch the use of the word consubstantial to denote the relation of God the Father to the divine Son or Logos, was condemned. Although it afterwards became the Council of Nicea the watchword of the orthodox faction.

PAULING, JAMES KIRKE (1778–1860), American writer and politician, was born in Dutchess county, New York, on the 2nd of August 1778. After a brief course at a village school, he removed in 1800 to New York City, where in connexion with his brother-in-law, William Irving, and Washington Irving, he began in January 1807 a series of short lightly humorous articles under the title of The Saratoga Printer. In 1814 he published a political pamphlet, “The United States and England,” which attracted the notice of President Van Buren, who in 1815 appointed him secretary to the board of navy commissioners, which position he held until November 1823. Subsequently Pauling was navy agent in New York City from 1825 to 1837, and from 1837 to 1841 was secretary of the navy in the cabinet of President Van Buren. From 1841 until his death on the 6th of April 1860 he lived near Hyde Park, in Dutchess county, New York. Although much of his literary work consisted of political journalism, he yet found time to write a large number of essays, poems and tales. From his father, an active revolutionary patriot, Paulding inherited strong anti-British sentiments. He was among the first distinctively American writers, and protested vigorously against intellectual thraldom to the mother-country. As a prose writer he is chaste and elegant, generally just, and realistically descriptive. As a poet he is gracefully commonplace, and the only lines by Paulding which survive in popular memory are the familiar—

“Peter Piper picked a peck of pickled peppers:
Where is the peck of pickled peppers Peter Piper picked?”

which may be found in Kenngismark.

The following is a partial list of his writings: The Diverting History of John Bull and Brother Jonathan (1812); The Lay of the Scottish Fiddle (1813), a good-natured parody on The Lay of the Last Minstril; Letters from the South (1817); The Backwoodsman: a Poem (1818); Salmagundi (2nd and 3rd, 1819–20); The Sketch of Old England, by a New England Man (1822); Koningsmarke, the Long Finne (1823), a quiz on the romantic school of Walter Scott; John Bull in America; or the New Muschonants (1824), a broad caricature of the early type of American humorist; The Merry Wives of Gotham (1826); Chronicles of the City of Gotham, from the Papers of a Retired Councilman (1830); The Dutchman’s Fireside (1831); Westward Ho (1832); A Life of Washington (1835), a biography of Washington, written gracefully in the same style as The Merry Wives of Gotham (see PAULING, JAMES K. Paulding’s Select Works (4 vols., 1865–1868), and a biography called Literary Life of James K. Paulding (New York, 1867).

PAULET, POULET or POULET, an English family of an ancient Somersetshire stock, taking a surname from the parish of Poulton near Bridgewater. They advanced themselves by a series of marriages with heirs, acquiring manors and lands in Somersetshire, Wilts, Devonshire and Hampshire. A match with a Denebald early in the 15th century brought the manor of Hinton St George, still the seat of the elder line, the earls Poulton. An ancestor of this branch, Sir Amias Poulten or Poulten (d. 1557), knighted in 1487 after the battle of Stoke, was treasurer of the Middle Temple in 1521, when Wolsey, in revenge for an indiscretion suffered at the latter’s hands, when the future chancellor was a young parson at Limington, forbade his leaving London without leave. To propitiate the cardinal, Sir Amias, rebuilding the Middle Temple gate, decorated it with the cardinal’s arms and badge. Sir Hugh Poulten, his eldest son, a soldier who had distinguished himself in 1544 at Boulogne in the king’s presence, had, in 1545, a patent of the captaincy of Jersey with the governance of Montorgueil Castle. His wisdom and experience in the wars made Queen Elizabeth employ him at Havre in 1562 as advisor to the earl of Warwick. He died in 1572, having married, as his second wife, the wealthy widow of Sir Thomas Pope, founder of Trinity College, Oxford. Sir Amias Poulten (1536–1588), Sir Hugh’s son and heir by a first marriage, is famous as the puritan knight into whose charge at Tutbury and Charley was given the queen of Scots. After his prisoner’s sentence at Fotheringhay, he beset Elizabeth’s ministers with messages advising her execution, but he firmly withstood “with great grief and bitterness,” the suggestion that she should be put to death secretly, saying that God and the law forbade. Sir Anthony Poulten (1562–1600),
his eldest surviving son, succeeded him as governor of Jersey and was father of John Poulett (1586–1649) to whom Charles I. in 1627 gave a patent of peerage as Lord Poulett of Hinton St George. In spite of the puritan opinions of his family he declared for the king, raising for the royal army a brigade which he led in Dorsetshire and Devonshire. He was taken prisoner for the second time at the fall of Exeter in 1646 and suffered a heavy fine. His eldest son John, the second Lord Poulett (1615–1665) was taken with his father at Exeter. John, the fourth Lord Poulett (1663–1743), having been a commissioner for the union, was created in 1706 Viscount Hinton of Hinton St George and Earl Poulett. In 1710–1711 he was first lord of the treasury and nominal head of an administration controlled by Harley. A garter was given him in 1712. A moderate Tory, his places were taken from him at the accession of the house of Brunswick. The fifth earl (d. 1684) re-settled the family estates in 1853 in order to bar the inheritance of one William Turnour Thomas Poulett who, although born in wedlock of the wife of the earl’s cousin William Henry Poulett, was repudiated by her husband, afterwards the sixth earl. In 1903 the sixth earl’s son by a third marriage established his claim to the peerage, and in 1909 judgment was given against the claim of William Turnour Poulett, thus styling himself Earl Poulett.

A younger line of the Pouletts, sprung from William Poulett of Melcombe, seargent-at-law (d. 1435), reached higher honours than an earldom. William Poulett, by his marriage with Eleanor Delamar (d. 1413), daughter of Philip Delamar and heir of her brother, acquired for his descendants Fisherton Delamar in Wiltshire and Nunney Castle in Somerset. Their son Sir John Poulett married Constance, daughter and coheir of Hugh Poyning, son and heir of Sir Thomas Poyning, Lord St John of Basing. Through this marriage came the lordship and manor of Basing, and the manor of Ampth or Ham Port which was passed to a collateral Norman lord at the time of the Domesday Survey. Sir John Poulett of Basing, by his cousin Alice Poulett of the Hinton line (his wife in or before 1467), was father of Sir William Poulett, who, during a very long and supple career as a statesman in four reigns—"I am sprung," he said, "from the willow and not from the oak"—raised his house to a marquessate. Henry VIII. rewarded his diplomatic and judicial services and his campaign against the Pilgrims of Grace with the site and lands of Netley Abbey, the revival of the St John barony, a garter and many high offices. The king’s death found him lord president of the council and one of the executors of the famous will of the sovereign. The fall of the protector Somerset gave him the lord treasurership and a patent of the earldom of Wiltshire. He shared the advancement of Northumberland and was created in 1551 marquess of Winchester, but, although he delivered the crown jewels to the Lady Jane in 1553, he was with the lord at Baynard’s Castle who married his son Mary. In spite of his great age he was in the saddle at the proclamation of Mary’s successor and was speaker in two Elizabethan parliaments. Only his death in 1572 drew from office this tenacious treasurer, whose age may have been nigh upon a hundred years.

His princely house at Basing was held for King Charles by John, the fifth marquess, whose diamond had scratched "Aimez Loyauté" on every pane of its windows. Looking on a main road, Basing, with its little garrison of desperate cavaliers, held out for two years against siege and assault, and its shattered walls were in flames about its gallant master when Cromwell himself stormed an entry. The old cavalier marquess died in 1675, his great losses uncompensated, and his son Charles, a morose extravagant, had the dukedom of Bolton in 1689 for his desertion of the Stuart cause. This new title was taken from the Bolton estates of the Scropes, Lord Winchester having married a natural daughter of Emmanuel, earl of Sunderland, the last Lord Scrope of Bolton. Charles, second duke of Bolton (1661–1722), was made lord-lieutenant of Ireland in 1717. A third Charles, the 3rd duke, is remembered as an opponent of Sir Robert Walpole and as the husband of Lavinia Fenton, the Polly Peckham of Gay’s open. The sixth and last duke of Bolton, an admiral of undistinguished services, died in 1794 without legitimate issue. His dukedom became extinct, and Bolton Castle again passed by bequest to an illegitimate daughter of the fifth duke, upon whom it had been entailed with the greater part of the ducal estates. (O. B.)

PAULI, REINHOLD (1823–1882), German historian, was born in Berlin on the 25th of May 1823. He was educated at the universities of Bonn and Berlin, went to England in 1847, and became private secretary to Baron von Bunsen, the Prussian ambassador in London. Returning to Germany in 1855 he was professor of history successively at the universities of Rostock, Tübingen (which he left in 1866 because of his political views), Marburg and Göttingen. He retained his chair at Göttingen until his death at Bremen on the 3rd of June 1882. He was a careful and industrious student of the English records, and his writings are almost wholly devoted to English history.

His first work, König Alfred und seine Stellung in der Geschichte Englands (Berlin, 1851), was followed by monographs on Bischof Grosseteste and Adam von Marsh (Tübingen, 1864), and on Simon von Monfort (Tübingen, 1867). He continued J. M. Lappenberg’s Geschichte von England from 1154 to 1599 (Gotha, 1853–1858), and himself wrote a Geschichte Englands (Leipzig, 1864–1875), dealing with the two volumes on 1514 and 1585. Two volume historical essays, Bilder aus All-England (Gotha, 1860 and 1876), and Aufsätze zur englischen Geschichte (Leipzig, 1886 and 1883), and numerous historical articles in German periodicals came from his pen; and he edited several of the English chronicles for the Monumenta Germaniae historica.

See R. Pauli, Lebenserinnerungen, edited by E. Pauli (Halle, 1895); and the sketch of his life prefixed to O. Hartwig’s edition of his Aufsätze (Leipzig, 1885).

PAULICIANS, an evangelical Christian Church spread over Asia Minor and Armenia from the 6th century onwards. The first Armenian writer who notices them is the patriarch Nersis II. They were described by Ambrose as a cyclical community who share with Nestorians in belief and prayer and take their offerings to their shrines and receive communion from them, as if from the ministers of the oblations of the Paulicians. The patriarch John IV. (c. 728) states that Nersis, his predecessor, had chastised the sect, but ineffectually; and that after his death (c. 554) they had continued to lurk in Armenia, where, reinforced by Iconoclasts driven out of Albania of the Caucasus, they had settled in the region of Djirka, probably near Lake Van. In his 31st canon John identifies them with the Mes-salians, as does the Armenian Gregory of Narek (c. 950). In Albania they were always numerous. We come now to Greek sources. An anonymous account was written perhaps as early as 840 and incorporated in the Chronicon of Georgius Monachus. This (known as Esc.) was edited by J. Friedrich in the Munich Academy Sitzungsberichte (1856), from a 10th-century Esorial codex (Plut. 1, No. 1). It was also used by Pothier (c. 867), bk. iv., chs. 1–10 of his Historia Manicheorum, who, having held an inquisition of Paulicians in Constantinople was able to supplement Esc. with a few additional details; and by Petrus Siculo (c. 868). The latter visited the Paulician fortress Tephrte to treat for the release of Byzantine prisoners. His History of the Manicheans is dedicated to the archbishop of Bulgaria, whither the Paulicians were sending missionaries. Zigabenus (c. 1100), in his Panophia, uses beside Esc. an independent source.

The Paulicians were, according to Esc., Manicheans, so called after Paul of Samosata (q.v.), son of a Manichean woman Callinice. She sent him and her other son John to Armenia as missionaries, and they settled at the village of Episparis, or "seedplot," in Phanarea. One Constantine, however, of Mananail, a cottan on the western Euphrates 60–70 m. west of Erzerum, was regarded by the Paulicians as their real founder. He is said to have been teaching on the Gospel and the Epistles of Paul, rejecting other scriptures; and the Pauline nations of Silvanus, organized churches in Castrum Colonias and Cibossa, which he called Macedonia, after Paul’s congregation of that

1 In the Armenian Letterbook of the Patriarchs (Tiflis, 1901), p. 73.
2 Opera (Venetiae, 1854), p. 89.
name. His successors were Simeon, called Titus; Gegesnius, an Armenian, called Timotheus; Joseph, called Epaphroditus; Zachariah, rejected by some; Baanes, accused of immoral teaching; lastly Sergius, called Tychicus. As Cibosa, so their other congregations were renamed, Mananali as Achaea, Argeaum and Cynoscora as Colossae, Mopsuestia as Ephesus, and so on.

Phoibus and Petrus Siculus supply a few dates and events. Constantine was martyred 684 by Simeon whom Constantine Pogonatus had sent to repress the movement. His victim's death so impressed him that he was converted, became head of the sect, and was martyred in 690 by Justinian II. About 702 Paul the Armenian, who had fled to Episparis, became head of the church. His son Gegesnius in 722 was taken to Constantinople, where he won over to his opinions the iconoclast emperor, Leo the Isaurian. He died in 745, and was succeeded by Joseph, who evangelized Phrygia and died near Antioch of Pisidia in 775. In 732 Constantine V. transplanted many Paulicians from Thessalonica to Melitene, and in 747 also from Bagraduni to Thessalonica (Erzerum), to Thrace, to defend the empire from Bulgarians and Scelvonneces. Early in the 9th century Sergius, greatest of the leaders, profiting by the tolerance of the emperor Nicephorus, began that ministry which, in one of the epistles canonized by the sect, but lost, he describes thus: "I have run from east to west, and from north to south, till my knees were weary, preaching the gospel of Christ." The iconoclast emperor Leo V., an Armenian, persecuted the sect afresh, and provoked a rising at Cynoscora, whence many fled to Saracen territory to Argaeum near Meline. For the next 50 years they continued to raid the Byzantine empire, although Sergius condemned retaliation. The empress Theodora (842–857) hung, crucified, beheaded or drowned some 100,000 of them, and drove yet more over the frontier, where from Argeaum, Amara, Tephriské and other strongholds their generals Karbeas and Chrysoscheir met with the emperor, until 873, when the emperor Bassil slew Chrysoscheir and took Tephriské.

Their sect however continued to spread in Bulgaria, where in 690 John Zimiskes settled a new colony of them at Philippopolis. Here Frederick Barbarossa found them in strength in 1189. In Armenia they reformed their ranks about 821 at Thonrak (Tendarek) near Diadon, and were numerous all along the eastern Ephrates and in Albania. In this region Smbat, of the great Bagraduni clan, reorganized their church, and was succeeded during a space of 170 or 200 years by seven leaders, enumerated by the Armenian Grigor Magistros, who as duke of Mesopotamia under Constantine Monomachos harried them about 1140. Fifty years later they were numerous in Syria and Cilicia, according to the Armenian bishops Nerses the Graceful and Nerses of Lambron. In the 10th century Gregory of Narek, against them in Armenia, and in the 11th Arisaces of Lastivort and Paul of Taron in the same tongue. During these later centuries their propaganda embraced all Armenia. The crusaders found them everywhere in Syria and Palestine, and corrupted their name to Publicani, under which name, often absurdly confounded with Sadduceae, we find them during the ages following the crusades scattered all over Europe. After 1200 we can find no notice of them in Armenian writers until the 18th century, when they reappear in their old haunts. In 1828 a colony of them settled in Russian Armenia, bringing with them a book called the Key of Truth, which contains their rites of name-giving, baptism and election, compiled from old MSS, 1 we know not when.

1 That this is so, is proved by the presence of a doublt in the text of the rite of baptism, the words "But the penitent" on p. 96, as far as "over the person baptized" on p. 97, repeating in substance the words "Next the one on p. 97. The doublt is "the person" and "hath been" on p. 98. This rite therefore was compiled from at least two earlier MSS. In the colophon also the compiler (as he calls himself) excuses the errors of orthography and grammar on the part of the later one, in the first instance due to himself but to earlier and ignorant copyists. The division (often inept) of the text into chapters, the references to chapter and verse of a printed N.T., and sundry pious stanzas which interrupt the context, are due to a later editor, perhaps a Jacobin, who had entered the text. The present introduction is later than the Crusades; but the rituals, as far as

Regarding Paulician beliefs we have little except hostile evidence, which needs sifting. Esc. gives these particulars:—

1. They anathematized Mani, yet were dualists and affirmed two principles—one the heavenly Father, who rules not this world but the world to come; the other an evil demijure, lord and god of this world, who made all flesh. The good god created angels only. The Romans (i.e. the Byzantines) erred in confusing these two first principles. Similarly the Armenian writer Gregory Magistros (c. 1040) accuses the Thomraki of teaching that "Moses saw not God, but the devil," and infers thence that they held Satan to be creator of heaven and earth, as well as of mankind. The Key of Truth teaches that after the fall Adam and Eve and their children were slaves of Satan until the advent of the newly created Adam, Jesus Christ. Except Gregory Magistros none of the Armenian sources lays stress on the dualism of the Paulicians. John IV. does not hint at it. The correspondence of the Virgin, allegorizing her as the upper Jerusalem in which the Lord came in and went out, and denying that he was really made flesh of her. John IV. records that in the orthodox Armenian Church of the 7th century many held Christ to have been made flesh in, but not of, the Virgin; and Armenian hymns call the Virgin mother church at once Theotokos and heavenly Jerusalem. It is practically certain that Paulicians held this view.

2. They allegorized the Eucharist and explained away the bread and wine of which Jesus said to His apostles, "Take, eat and drink," as mere words of Christ, and denied that we ought to offer bread and wine as a sacrifice.

Such allegorization meets us already in Origen, Eusebius and other early fathers, and is quite compatible with that use of a material Eucharist which Nerses II. attests among the Paulicians of the early 6th century, and for which the Key of Truth provides a hint. The Church, according to Gregory Magistros, held that "Jesus in the eucharist, by the gloss of the mass, of the mass, but of every table." We infer that the Paulicians merely rejected the Eucharistic rites and doctrine of the Greeks. According to Gregory Magistros the Thomraki would say: "We are no worshippers of matter, but of God; we reckon the cross and the church and the priestly robes and the sacrifice of mass all for nothing, and only lay stress on the inner sense."

4. They assailed the cross, saying that Christ is cross, and that we ought not to worship the tree, because it is a cursed instrument. John IV. and other Armenian writers report the same of the Armenian Paulicians or Thomraki, and add that they smashed up crosses when they could.

5. They repudiated Peter, calling him a denier of Christ, and would not accept his repentance and tears. 2 So Gregory Magistros, the language concerned, may belong to the remote age which alone suits the adoptionist Christology of the prayers.

In a fragmentary Syriac homily by Mar Jochanias, found in a Sinait. MS. written not later than the 10th century and edited by J. F. Stenning, in Aelia antiqua (Clarendon Press, 1896), the same hostility to Peter is expressed. Compare the following passages: "O Petros, thou wast convicted of fault by the keys of thy own making. How do men say that upon Petros I have built the church?"

"The Lord said not to him, upon thee I build the church, but he said, upon this rock (the rock is the rock by which the Lord was pleased) and build upon this rock. Behold, I have made thee know from the N.T. that that rock was the Messiah."

"O Petros, after that thou didst receive the keys of heaven, and the Lord was seen by thee after he rose from the dead, thou didst let go of the keys, and thy wage is agreed with thy master when thou saidst to him, Behold we have let go of everything and have come after thee. What then shall be to us? And the Lord said to him, Ye shall be sitting on twelve thrones and judging the tribes of Israel. And after all these signs, O Petros, thou wast cast away again to the former catching of fish. Wast thou ashamed of me, O Petros?"

Yet the same homilist "concerning the one who is made a priest," writes thus: "Lo, thou seest the priest of the people. And the Lord, he care the Lord instructed Peter! He said not to him once and stopped, but three times, Feed my sheep." The Syriac text is rendered from a Greek original of unknown age, which from its style and language corresponded with the Key of Truth may be judged to have been a Paulician writing.
Magistros reports the Thonraki as saying, “We love Paul and excrete Peter.” But in the Key of Truth there is little trace of extreme hostility to Peter. It merely warns us that all the apostles constitute the Church universal and not Peter alone; and in the rite of election, i.e. of laying on of hands and reception of the Spirit, the reader who is being elected assumes the ritual name of Peter. An identical rite existed among the 12th century Cathars (q.v.), and in the Celtic church of Gildas every presbyter was a Peter.

6. The monkish garb was revealed by Satan to Peter at the baptism, when it was the devil, the ruler of this world, who, so costumed, leaned forward and said, This is my beloved son. The same hatred of monkery characterized the Thonraki and inspired the Key of Truth. The other statements are nowhere echoed.

7. They called their meetings the Catholic Church, and the places they met in places of prayer, προφυταί. The Thonraki equally denied the name of church to buildings of wood or stone, and called themselves the Catholic Church.

8. They explained away baptism as “words of the Holy Gospel,” citing the text “I am the living water.” So the Thonraki taught that the baptismal water of the Church was “bath-water,” i.e. denied it the character of a reserved sacrament. But there is no evidence that they eschewed water-baptism. The modern Thonraki baptize in rivers, and in the 11th century when Gregory asked them why they did not allow themselves to be baptized, they answered: “Ye do not understand the mystery of baptism banished by the papacy for reasons of family.” They no doubt deferred the baptism which is death to sin, perhaps because, like the Cathars, they held post-baptismal sin to be unforgivable.

9. They permitted external conformity with the dominant Church, and held that Christ would forgive it. The same trait is reported of the Thonraki and of the real Manicheans.

10. They rejected the orders of the Church, and had only two grades of clergy, namely, associate itinerants (συνδομιου, Acts xix. 29) and coptists (βαπτιστα). A class of Astati (ἁρταρα) is also mentioned by Photius, i. 24, whom Neander regards as elect disciples of Sergius. They called their four original founders apostles and prophets—titles given also in the Key of Truth to the elect one. The Synechemi and Notarii dressed like other people; the Thonraki also scorned prescribed vestments, and the Baptist from Thonraki himself wore the garb of the bath-water,” i.e. nothing but the普通的 robe. Gregory Magistros, as we have seen, attests their predilection for the apostle Paul, and speaks of their perpetually “quoting the Gospel and the Apostolos.” These statements do not warrant us in supposing that they rejected 1 and 2 Peter, though other Greek sources allege it. The “Gospel and Apostle” was a comprehensive term for the whole of the New Testament (except perhaps Revelation), as read in church.

13. Their Christology was as follows: God out of love for mankind called up an angel and communicated to him his desire and counsel; then he bade him go down to earth and be born of woman. . . . And he bestowed on the angel so commissioned the title of “Paul,” denoting that he was to be an apostle and chosen to the work of that salvation. Then, when he was born of God and came down into the world, Mary, named herself son of God according to the grace given him from God; and he fulfilled all the command, and was crucified and buried, rose again and was taken up into heaven. Christ was only a creature (κτισμά), and obtained the title of Christ the Son of God in the reign of Octavius Caesar by way of grace and remuneration for fulfilment of the command.

The scheme of salvation here set forth recurs among the Latin Cathars. It resembles that of the Key of Truth, in so far as Jesus is Christ and Son of God by way of grace and through baptism, and he is called the one who is appointed for faithful fulfilment of God’s command. But the Key lays more stress on the baptism. “Then, it says, he became Saviour of us sinners, then he was filled with the Godhead; then he was sealed, then anointed; then was he called by the voice, then he became the loved one.” In this scheme therefore the Baptism occupies the same place which the Birth does in the other, but both are adoptionist.

The main difference then between the Greek and Armenian accounts of the Paulicians is that the former make more of their dualism. Yet this did not probably go beyond the dualism of the New Testament itself. They made the most of Paul’s antithesis between law and grace, bondage to Satan and freedom of the Spirit. Jesus was a new Adam and a fresh beginning, in so far as he was made flesh in and not of his mother, to whom, as both Esc. and the Key insist, Jesus particularly denied blessedness and honour (Mark iii. 31-35), limiting true kinship only to those who were children of God. The account of Christ’s flesh is torn out of the Key, but Paulicians claim it was at the baptism that “he put on that prismatic filment of light which Adam lost in the garden.” And this view we also meet with in Armenian fathers accounted orthodox.

The Armenian fathers held that Jesus, unlike other men, possessed incorruptible flesh, made of ethereal fire, and so far they shared the main heresy of the Paulicians. In many of their homilies Christ’s baptism is also regarded as his regeneration by water and spirit, and this view almost transcends the modest adoptionism of the Thonraki as revealed in the Key of Truth.

What was the origin of the name Paulician? The word is of Armenian formation and signifies a son of Paulik or of little Paul; the termination -ik must here originally expressed the diminutive, i.e. that Paul was a little Paul. As to the meaning of Paulicians, we are not to rouse the interest of the “followers of St. Paul.” Certain features of Paulicianism noted by Photius and Petrus Siculus are omitted in Esc. One of these is the Christhood of the fully initiated, who as such ceased to be mere “hearers” (audientes) and themselves became vehicles of the Holy Spirit. As Jesus anointed by the Spirit became the fused Paul, so they became Christos. So Gregory of Narck upbraids the Thonraki for their “anthropotrophia,” i.e. their self-confessed contemptible priesthood which is a likening of themselves to Satan” (=Christ in Thonraki parlance). And he repeats the taunt which the Arab Emir addressed to Smbat, their leader, as he led him to execution: “If Christ rose on the third day, then since you call yourself Christ, I will slay you and bury you; and if you shall come to life again after thirty days, then I will know you are Christ, even though you take so many days over your resurrection.” Similarly (in a 10th-century form of renunciation of Bogomil error preserved in a Vienna codex) we hear of Peter “the founder of the heresy of the Messalians or Lycoptetians or Fundatae and Bogomils who called himself Christ and promised to rise again after death.” Of the Persians, Typhon (the Satanic) is invoked in the same document to have been fellow initiate and disciple.

Because they regarded their Perfect or Elect ones as Christs and anointed with the Spirit, the medieval Cathars regularly adored them. So it was with Celtic saints, and Adamnan, in his life of St Columba, i. 37, tells how the brethren after listening to St Baithene, “still kneeling, with joy unspeakable, and with hands spread out to heaven, venerated Christ in the holy and blessed man.” So in ch. 44 of the same book we read how a humble stranger “worshipped Christ in the holy man” (i.e. St Columba); but such veneration was due to every presbyter. In 1837 we read of how an elect one of the Thonraki sect in Russian Armenia addressed his followers thus: “Lo, I am the cross: on my two hands light tapers, and give me adoration. For I am able to give you salvation, as much as the...”
cross and the saints"; and by the light of this we ought perhaps to interpret section ix. of Esc. "They blaspheme the precious cross, saying that the Christ is a cross." The Christ is an elect one, who, as the Cathars (q.v.) put it, having been consolled or become a Paraclete in the flesh, stands in prayer in the hands of the faithful in the form of a cross, while the congregation of hearers or audientes adore the Christ in him. The same idea that the perfect ones are christs as having received the Paraclete is met with in early Christian documents, and still survives among the Syriac-speaking peoples on the hills north of Mardin. These have their christs, and Dr E. A. Wallis Budge, to whom the present writer owes his information, was shown the stream in which their last christ had been baptized. In modern Russia also survives a sect of Bogomils called Christowstchtchino,1 because one member of it is adored by the rest as Christ. It was because they believed themselves to have living christs among them that the Paulicians rejected the fetish worship of a material cross, in which orthodox Armenian priests imagined they had by prayers and anointings confined the Spirit of Christ. It is also likely enough that they did not consider sensible matter to be a vehicle worthy to contain divine effluence and holy virtues, and knew that such rites were alien to early Christianity. The former scruple, however, was not confined to Paulicians, for it inspired the answer made by Eusebius, bishop of Thessalonica, to the emperor Maurice, when the latter asked that he should invite him to send the patron saint of that city. It runs thus: "While informing your reverence of the faith of the Thessalonians and of the miracles wrought among them, I must yet, in respect of this request of yours, remark that the faith of the city is not of such a kind as to fast that people desire to worship God and to honour his saints by means of anything sensible. For they have received the faith from the Lord's holy testimonies, to the effect that God is a spirit, and that those who worship must worship him in spirit and in truth." 2 Manicheans, Bogomils, Cathars and Paulicians for like reasons denied the name of church to material constructions of wood and stone. Among the later Cathars of Europe we find the repudiation of marriage defended on the ground that the only true marriage is of Christ with his bride the Virgin church, and perhaps this is why Paulicians and Thronraki would not make of marriage a religious rite or sacrament.

Did the Paulicians, like the later Cathars (who in so much resembled them), reject water baptism? And must we so interpret clause ix. of Esc? Perhaps they merely rejected the idea that the numen or divine grace can be confined by priestly consecration in water and by mere washing be imparted to persons baptized. The Key of Truth regards the water as a washing of the body, and sees in the rite no operus operatum, but an essentially spiritual rite in which "the king releases certain rulers 3 from the prison of sin, the Son calls them to himself and comforts them with great words, and the Holy Spirit of the king forthwith comes and crowns them, and dwells in them." For this reason the Thronkaki adhere to adult baptism, which in ancient wise they confer at thirty years of age or later, and have retained in its primitive significance the rite of giving a Christian name to a child on the eighth day from birth. It is hardly likely that the Thronraki of the 10th century would have rejected water-baptism and yet have retained unction with holy oil; this Gregory Magistros attests they did, but he is an unreliable witness.

3 The expression "rulers" appears to be derived from Manichean speculation, or from the same cycle of myth which is reflected in 1 Cor. ii. 6, 8. The title "elect one," by the Armenian Paulicians also has a Manichean ring. It may be that under stress of common persecution there was a certain fusion in Armenia of Paulician and Manichean. The writings and tenets of Mani were widely diffused there. Such a fusion is probably reflected in the Key of Truth.

It is then on the whole probably that the Paulicians who appear in Armenian records as early as 550, and were afterwards called Thronraki, by the Greeks by the Armenian name Pauli- kiani, were the remains of a primitive adoptionist Christianity, which had been in the east and already condemned under the name of Pauliani by the council of Nice in 325. A renegade Armenian Catholicons of the 7th century named Isaac has preserved to us a document which sums up their tenets.4 He adduces it as a sort of redudio ad absursum of Christians who would model life and cult on Christ and his apostles, unencumbered by later church traditions. It runs thus: (1) Christ was thirty years old when he was baptized. Therefore they baptize no one until he is thirty years of age. (2) Christ, after baptism, was not anointed with myrrh nor with holy oil, therefore let them not be anointed with myrrh or holy oil. (3) Christ was not baptized in a font, but in a river. Therefore, let them not be baptized in a font. (4) Christ, when he was about to be baptized, did not recite the creed of the 318 fathers of Nice, therefore shall they not make profession of it. (5) Christ when about to be baptized, was not first made to turn to the west and renounce the devil and blow upon him, nor again to turn to the east and make a compact with God. For he was himself true God. So let them not impose these things on those to be baptized. (6) Christ, after he had been baptized, did not partake of his own body. Nor let them so partake of it. (7) Christ, after he was baptized, fasted 40 days and only that; and for 120 years such was the tradition which prevailed in the Church. We, however, fast 50 days before Pascha. (8) Christ did not hand down to us the teaching to celebrate the mystery of the offering of bread in church, but in an ordinary house and sitting at a common table. So then let them not offer the sacrifice of bread in churches. (9) It was after supper, when his disciples were sat, that Christ gave them to eat of his own body. Therefore let them first eat meats and be sated, and then let them partake of the mysteries. (10) Christ, although he was crucified for us, yet did not command us to adore the cross, as the Gospel testifies. Let them therefore not adore the cross. (11) The cross was of wood. Let them therefore not adore a cross of gold or silver or bronze or stone. (12) Christ wore neither humeral nor amice nor maniple nor stole nor chasuble. Therefore let them not wear these garments. (13) Christ did not institute the prayers of the liturgy or the Holy Epiphanies, and all the other prayers for every action and every hour. Let them therefore not repeat them, nor be hallowed by such prayers. (14) Christ did not lay hands on patriarchs and metropolitans and bishops and presbyters and deacons and monks, or ordain several prayers. Let them therefore not be ordained nor blessed with these prayers. (15) Christ did not enjoin the building of churches and the furnishing of holy tables, and their anointing with myrrh and anointing with a myriad of prayers. Let them not do it. (16) Christ did not fast on the fourth day of the week, and on the Paschal festival, and did not fast either. (17) Christ did not bid us pray towards the east. Neither shall they pray towards the east.

PAULINUS, SAINT, OF NOLA (353-431). Pontius Meropius Anicius Paulinus, who was successively a consul, a monk and a

4 See Fr. Combes, Historia heretica monachaliturum col. 317 (Paris, 1648), col. 317. In the printed text this document, entitled An Invective Against the Armenians, is dated 800 years after Constantine, but the author Isaac Catholicon almost certainly belonged to the earlier time.
bishops, was born at Bordeaux in A.D. 553. His father, praefectus praetorio in Gaul, was a man of great wealth, who entrusted his son's education, with the best of results, to Augustine. In 373 Paulinus returned to the rank of consul sufectus, and in the following year he appears to have been sent as consularis into Campania. It was at this period, while present at a festival of St Felix of Nola, that he entered upon his lifelong devotion to the cult of that saint. He had married a wealthy Spanish lady named Therasia; this happy union was clouded by the death in infancy of their only child—a bereavement which, combined with the many disasters by which the empire was being visited, did much to foster in them that world-weariness to which they afterwards gave such emphatic expression. From Campania Paulinus returned to his native place and came into correspondence or personal intimacy with men like Martin of Tours and Ambrose of Milan, and ultimately (about 389) he was formally received into the church by bishop Delphinus of Bordeaux, whence shortly afterwards he withdrew with his wife beyond the Pyrenees. The asceticism of Paulinus and his liberality towards the poor soon brought him into great repute; and while he was spending Christmas at Barcelona, the people insisted on his being forthwith ordained to the priesthood. The irregularity of this step, however, was resented by many of the clergy, and the occurrence is still passed lightly over by his Roman Catholic panegyrist. In the following year he went into Italy, and after visiting Ambrose at Milan and Siricius at Rome—the latter of whom received him somewhat coldly—he proceeded into Campania, where, in the neighbourhood of Nola, he settled among the rude structures which he had caused to be built around the tomb and relics of his patron saint. With Therasia (now a sister, not a wife), while leading a life of rigid asceticism, he devoted the whole of his vast wealth to the entertainment of needy pilgrims, to payment of the debts of the insolvent, and to public works of utility or ornament; besides building basiliicas at Fondi and Nola, he provided the latter place with a much-needed aqueduct. At the next vacancy, not later than 409, he succeeded to the bishopric of Nola, and this office he held with ever-increasing honour until his death, which occurred shortly after that of Augustine, whose friend he was, in 431. He is commemorated by the Church of Rome on the 22nd of June.

The extant writings of Paulinus consist of some fifty Epistolae, addressed to Sulpicius Severus, Delphinus, Augustine, Jerome and others; thirty-two Carmina in a great variety of metre, including a series of hexameter "natales," begun about 393 and continued annually in honour of the festival of St Felix, metrical epistles to Ausonius and Gildas, and paraphrases of three psalms; and a Passio S. Genesii. They reveal to us a kindly and cheerful soul, well versed in the literary accomplishments of the period, but without any strength of intellectual grasp and peculiarly prone to superstition.

His works were edited by Rosweyde and Fronton le Duc in 1622 (Antwerp, 8vo), and their text was afterwards in Bod. Hall. patre. (1673). The next editor was Le Brun des Marettes (2 vols. 4to, Paris, 1685), whose text was reproduced in substance by Muratori (Verona, 1736), and reprinted by Migne. The poems and letters are edited in the Vienna Corpus script. eccl. lat., and the Carmina by Breithaupt, Reimringer, Bruck, and J. Paulin von Nola Breslau, 1904 and other literature cited in Herzog-Hauck, Realencyk. fär prot. Theol. vol. xv.

PAULINUS (d. 644), first bishop of the Northumbrians and archbishop of York, was sent to England by Pope Gregory I. in 601 to assist Augustine in his mission. He was consecrated by Justus of Canterbury in 623 and escorted Æthelberht, daughter of Æthelberht, the Northumbrian king Edwin (q.v.). In 627 Edwin was baptized and assigned York to Paulinus as his see. It was at Lincoln that he consecrated Honorius as archbishop of Canterbury. In 633 Edwin was slain at Hatfield Chase and Paulinus retired to Kent, where he became bishop of Rochester. The pallium was not sent him until 634, when he had withdrawn from his province. He died in 644.

PAULINUS, GAIUS SuetonIUS (1st century A.D.), Roman general. In 42, during the reign of Claudius, he put down a revolt in Mauretania, and was the first of the Romans to cross the Atlas range. He subsequently wrote an account of his experiences. From 59-62 he commanded in Britain, and, after a severe defeat, finally crushed the Iceni under Boadicea (Boudicca). A complaint having been made to the emperor that he was needlessly protracting hostilities, he was recalled, but he was consul (for the second time) in 66. During the civil war he fought on the side of Otho against Vitellius, and obtained a considerable success against Aulus Caecaia Albinus (one of the Vitellian generals) near Cremona, but did not follow it up. When Caecina had been joined by Fabius Valens, Paulinus advised his colleagues not to risk a decisive battle, but his advice was disregarded, and Otho (q.v.) was utterly defeated at Bedriacum. After Vitellius had been proclaimed emperor, Paulinus asserted that it was in consequence of his own treachery that Otho's army had been defeated. Vitellius pretended to believe this, and eventually pardoned Paulinus, after which nothing further is heard of him.

See Dio Cassius lxxi. 7–12; Tacitus, Annals, xiv. 30–39; Histories, i. 87, 90, ii. 23–41, 44, 60; Pliny, Nat. Hist. v. i; Plutarch, Otho, 7, 8.

PAULUS, FRIEDRICH (1846–1908), German philosopher and educationalist, was born at Langenhorn (Schleswig) and educated at Erlangen, Bonn and Berlin, where he became extraordinary professor of philosophy and pedagogy in 1878. In 1886 he succeeded Eduard Zeller as professor of moral philosophy at Berlin. He died on the 14th of August 1908. He was the greatest of the pupils of G. T. Fechner, to whose doctrine of panpsychism he gave great prominence by his Einleitung in die Philosophie (1892; 7th ed., 1900; Eng. trans., 1895). He went, however, considerably beyond Fechner in attempting to give an epistemological account of our knowledge of the psychophysical. Admitting Kant's hypothesis that by inner sense we are conscious of mental states only, he holds that this consciousness constitutes a knowledge of the "thing-in-itself"—which Kant denies. Soul is, therefore, a practical reality which Paulsen, with Schopenhauer, regards as known by the act of "will." But this "will" is neither rational desire, unconscious irrational will, nor conscious intelligent will, but an instinct, a "will to live" (Zielstrebigkeit), often subconscious, pursuing ends, indeed, but without reasoning as to means. This conception of will, though consistent and convenient to the main thesis, must be rigidly distinguished from the ordinary significance of will, i.e. rational desire. Paulsen is almost better known for his educational writings than as a pure philosopher. His German Education, Past and Present (Eng. trans., by I. Lorenz, 1907) is a work of great value.

Among his other works are: Versuch einer Entwicklungs geschichte d. Kantischen Erkenntnistheorie (Leipzig, 1875); Im Kant (1896, 1889); "Grundzüge der Organisation und Lebensordnungen der deutschen Universitäten im Mittelalter" (in Sybel's Histor. Zeitschr. vol. xlv. 1881); Gesch. d. gelehrnten Unterrichts auf d. deutschen Schulen und Universitäten (1885, 1896); System der Ethik (1889, 1899; Eng. trans. 1907); Das Realgymnasium u. d. humanit. Bildung (1889); Kant d. Philosoph. d. Protestantismus (1899); Schopenhauer, Humbel u. Mephistopheles (1900); Philosophia militans (1900, 1901); Parteipolitik u. Moral (1900).

PAULUS, HEINRICH EBERHARD GottLOB (1761–1851), German rationalistic theologian, was born at Leonberg, near Stuttgart, on the 1st of September 1761. His father, a Lutheran clergyman at Leonberg, dabbled in spiritualism, and was deprived of his living in 1771. Paulus was educated in the seminary at Tübingen, was three years master in a German school, and then spent two years in travelling through England, Germany, Holland and France. In 1789 he was chosen professor ordinary of Oriental languages at Jena. Here he lived in close intercourse with Schiller, Goethe, Herder and the most distinguished literary men of the time. In 1793 he succeeded Johann Christoph Döderlein (1745–1792) as professor of exegetical theology. His special work was the exposition of the Old and New Testaments in the light of his great Oriental learning
PAULUS, LUCIUS AEMILIUS—PAULUS DIACONUS

and according to his characteristic principle of "natural explanation." In his exposition of the Gospel narratives Paulus sought to remove what other interpreters regarded as his porosity from the Bible by relating the text to the facts related and the author's opinion of it, by seeking a naturalistic exegesis of a narrative, e.g., that κύρις τῆς θαλάσσας (Matt. xiv. 25) means by the shore and not on the sea, by supplying circumstances omitted by the author, by remembering that the author produces miracles as occurrences which can now be explained otherwise, e.g., exorcisms. His Llevus of Jesus (1828) is a synoptical translation of the Gospels, prefaced by an account of the preparation for the Christ and a brief summary of His history, and accompanied by very short explanations interwoven in the translation. The form of the work was fatal to its success, and the subsequent Exegetisches Handbuch rendered it quite superfluous. In this Handbuch Paulus really contributed much to a true interpretation of the Gospel narratives. In 1863 he became professor of theology and Consistorialrat at Würzburg. After this he filled various posts in south Germany—school director at Bamberg (1867), Nuremberg (1868), Ansbach (1870)—until he became professor of exegesis and church history at Heidelberg (1871-1883). He died on the 22nd of August 1883.

His chief exegetical works are his Philologisch-kritischer und historischer Kommentar über das Neue Testament (4 vols., 1800-1804); Philologischer Clavis über die Psalmen (1791); Philologischer Clavis über Jesaias (1793), and particularly his Exegetisches Handbuch über die vier Evangelien (4 vols., 1832-1835; 2nd ed. 1841-1842). He also edited a collected small edition of Baruch Spinoza's works (1802-1803), a collection of the most noted Eastern (1792-1803), F. W. J. Schelling's Vorlesungen über die Offenbarung (1812). Schilderungen des Leben und Lebensgeschichte (1839). See Karl Reinich-Meldberg, H. E. G. Paulus und seine Zeit (1853), and article in Herzog-Hauck, Realencyklopädie; cf. F. Lichtenberger, History of German Theology in the Nineteenth Century, pp. 21-24.

PAULUS (older form PAULUS), LUCIUS AEMILIUS, surnamed MACEDONICUS (c. 250-166 B.C.), Roman general, a member of a patrician family of the Aemilian gens, son of the consul of the same name who fell at Cannae. As consul for the second time (168) he was engaged in the campaign in the Macedonian War, which the incapacity of previous generals had allowed to drag on for three years. He brought the war to a speedy termination by the battle of Pydna, fought on the 22nd of June (Julian calendar) 168. Macedonia was henceforward a Roman province, and Paulus, having made a tour through Greece, with the assistance of ten Roman commissioners arranged the affairs of the country. He enjoyed a magnificent triumph, which lasted three days and was graced by the presence of the captive king Perseus and his three children. He lost his two sons by his second wife, and was thus left without a son to bear his name, his two sons by his first wife having been adopted into the Fabian and Cornelian gentes. Paulus was censor in 164, and died in 160 after a long illness. At the funeral games exhibited in his honour the Heuca of Terence was acted for the second and the Aediphi for the first time. An aristocrat to the backbone, he was yet beloved by the people. Of the vast sums brought by him into the Roman treasury from Spain and Macedon, he is said to have retained only a bare livelihood and scarcely sufficed to pay his wife's dowry. As a general he was a strict disciplinarian; as an augur he discharged his duties with care and exactness. He was greatly in sympathy with Greek learning and art, and was a friend of the historian Polybius.

See Plutarch, Aemilius Paulus; Livy xiv. 17-xvi. 41; Polybius xxix.-xxxii.

PAULUS, surnamed SILENTIARIUS ("the silentary," one of the ushers appointed to maintain silence within the imperial palace), Greek poet, contemporary and friend of Agathias, during the reign of Justinian. In addition to some 80 epigrams, chiefly erotic and panegyric in character, preserved in the Greek Anthology, there is extant by him a description (Φασιός) of the church of St Sophia, and of its pulpitu (διακόνιον), in all some 1300 hexameters after the style of Nonnus, with short iambic dedications to Justinian. The poem was recited at the second dedication of the church (a.d. 562), in the episcopal hall of the patriarchate. The poems are of importance for the history of Byzantine art in the 6th century. Another poem (also preserved in the Anthology) on the warm baths of Pythia in Bithynia, the Anacreontic rhythm, has sometimes been attributed to him.

BIBLIOGRAPHY.—Ed. of the poems on St Sophia, by I. Becker in the Bonn Corpus scriptorum historiae, Byz. (1837), including the descriptions of the church by Du Cange and Banduri, and in J. F. Migne, Patrologia graeca, lxxvi.; metrical translations, by C. Haydn and others. The poem on the baths in the 8th century, St. Paul's, edited by (1875); poem on the Baths in G. E. Lessing, Zur Geschichte und Literatur, i. 5 (1773); see also Merian-Genais, De Paulo Silentiario (Leipzic, 1859).

PAULUS DIACONUS, or Warnefrid, or Casinensis (c. 720-804), the historian of the Lombards, belonged to a noble Lombard family and flourished in the 8th century. An ancestor named Leupichis entered Italy in the train of Alboin and received lands at or near Forum Julii (Friuli). During an invasion the Avars swept off the five sons of this warrior into Illyricum, but one, his namesake, returned to Italy and restored the ruined fortunes of his house. The grandson of the younger Leupichis was Warnefrid, who by his wife Theodelinda became the father of Paulus. Born between 720 and 725 Paulus received an exceptionally good education, probably at the court of the Lombard king Rathtis in Pavia, learning from a teacher named Flavían the rudiments of Greek. It is probable that he was secretary to the Lombard king Desiderius, the successor of Rathtis: it is certain that this king's daughter Adelpegræ was his pupil. After Adelpegræ had married Arichis, duke of Beneventus, Paulus at her request wrote his continuation of Eutropius. It is possible that he then took refuge at Beneventus: when Pavia was taken by Charlemagne in 774, it is much more likely that his residence was anterior to this event by several years. Soon he entered a monastery on the lake of Como, and before 782 he had become an inmate of the great Benedictine house of Monte Cassino, where he made the acquaintance of Charlemagne. About 776 his brother Arichis had been carried as a prisoner to France and, after five years later the Frankish king visited Rome, Paulus successfully wrote the panegyric of the captive. His literary attainments attracted the notice of Charlemagne, and Paulus became a potent factor in the Carolingian renaissance. In 782 he returned to Italy and to Monte Cassino, where he died on the 13th of April in one of the years between 794 and 800.

His surname Diaconus, or Levita, shows that he took orders as a deacon; and some think he was a monk before the fall of the Lombard kingdom.

The chief work of Paulus is his Historia gentis Langobardorum. This incomplete history in six books was written after 787 and deals with the story of the Lombards from 568 to the death of King Liutprand in 747. The story is told from the point of view of Italian law, although it was written by an English writer, and was first printed in Paris in 1514. It has been translated into English, German, French and Italian, the English translation being by W. D. Foulke (Philadelphia, 1807), and the German by O. F. and R. Jacobi (Leipzig, 1879). Among the editions of the Latin the best is that edited by L. Bethmann and G. Waiz, in the Monumenta Germaniae historica. Scriptores rerum langobardicarum (Hanover, 1875).

Carried on with this work is Paulus's Historia romana, a continuation of the Brevarius of Eutropius. This was compiled between 766 and 774, at Benevento. The story runs that Paulus advised Adelpegræ to read Eutropius. She did so, but complained that this Greek writer said nothing about ecclesiastical affairs and stopped with the death of Justinian. When Adelpegræ read the Valens in 354, consequently Paulus interwove extracts from the Scriptures, from the ecclesiastical historians and from other sources with Eutropius, and added six books, thus bringing the history down to 553. This work was also very popular during the middle ages. It has been edited by H. Droysen and published in the Monumenta Germaniae historica. Actores antiquissimi, Bd. iii. (1879).
Paulus wrote at the request of Angilram, bishop of Metz (d. 791), a history of the bishops of Metz to 766, the first work of its kind north of the Alps. This Gesta episcoporum melissum is published in Bd. ii. of the Monumenta Germaniae historica, Series latina, vol. vii. (Leipzig, 1870). He also wrote many letters, verses and epitaphs, including those of Duke Archis and of many members of the Carolingian family. Some of the letters are published with the Historia Langobardorum in the Anthologia Poetae minoris of 1842. A collection of epigrams attributed to E. Dümmler will be found in the Poetae latini aevi carolini, Bd. i. (Berlin, 1881). Fresh material having to come, a new edition of the poems (Die Gedichte des Paulus Diaconus) has been edited by Karl Nattfert. A monograph in the series Monumenta Germaniae historica, Series latina, vol. vii. (Leipzig, 1870), by F. Wattenbach, Deutschlands Geschichtsquellen, Bd. i. (Berlin, 1904); A. Hauck, Kirchengeschichte Deutschlands, Bd. ii. (Leipzig, 1890); P. del Giudeo, Studi di storia e diritto (Milan, 1889); and U. Balzani, Le Cronache tibulane nel medio evo (Milan, 1884).

PAUL VERONESE (1528–1588), the name ordinarily given to Paolo Caliari, or Cagliari, the latest of the great cycle of painters of the Venetian school, who was born in Verona in 1528 according to Zacetti and others, or in 1532 according to Ridolfi. His father, Gabriele Caliari, a sculptor, began to train Paolo to his own profession. The boy, however, showed more propensity to painting, and was therefore transferred to his uncle, the painter Antonio Badile, whose daughter he eventually married. According to Vasari, he was the pupil of Giovanni Carotto, a painter proficient in architecture and perspective; this statement remains unconfirmed. Paolo, in his mature years, applied himself to copying from the engravings of Albert Dürer and the drawings of Parmigian. He did some work in Verona, but found there little outlet for his abilities, the field being pretty well occupied by Ligozzi, Battista dal Moro, Paolo Farinato, Domenico Riccio, Brusasorci and other artists. Cardinal Ercole Gonzaga took him, when barely twenty years of age, to Mantua, along with the three last-named painters, to execute in the cathedral a picture of the "Temptation of St. Anthony"; here Caliari was considered to excel his competitors. Returning to Verona, he found himself exposed to some envy and ill-will. Hence he formed an artistic partnership with Battista Zelotti, and they painted together in the territories of Vicenza and Treviso, and also in Padua where Paolo remained. In this city his first masterpieces were executed, in 1559, in the sacristy of the monastery of S. Sebastian, an uncle of his being prior of the monastery. The subjects on the vaulting are taken from the history of Esther; and these excited so much admiration that henceforward Caliari, aged about twenty-eight, ranked almost on a par with Tintoretto, aged about forty-five, or with Titian, who was in his eightieth year. Besides the Esther subjects, these buildings contain his pictures of the "Baptism of Christ," the "Martyrdom of St. Marcus and St. Marcellinus," the "Martyrdom of St. Sebastian," &c. As regards this last-named work, dating towards 1563, there is a vague tradition that Caliari painted it when he had taken refuge in the monastic. He entered into a competition for painting the ceiling of the library of St. Mark, and not only was defeated in the selection, but lost all influence; his power that his very rivals voted him the golden chain which had been tendered as an honorary distinction. At one time he returned to Verona, and painted the "Banquet in the House of Simon the Pharisee, with Jesus and Mary Magdalene"—a picture now in Turin. In 1560, however, he was in Venice again, working partly in the S. Sebastiano buildings and partly in the ducal palace. He visited Rome in 1565, in the suite of Girolamo Grimani, the Venetian ambassador, and studied the works of Raphael and Michelangelo, and especially the antique. Returning to Venice, he was overwhelmed with commissions. He was compelled to decline an invitation from Philip II. to go to Spain and assist in decorating the Escorial. One of his pictures of this period is the famous "Queen of the Sea," in the ducal palace. He died in Venice on the 20th (or perhaps 19th) of April 1588, and was buried in the church of S. Sebastiano, a monument being set up to him there by his two sons, Gabriele and Carlo, and his brother, Benedetto, all of them painters.

Beyond his magnificent performances as a painter, the known incidents in the life of Paul Veronese are very few. He was honoured and loved, being kind, amiable, generous and an excellent father. His person is well known from the portraits left by himself and others: he was a dark man, rather good-looking than otherwise, somewhat bald in early middle age, and with nothing to mark an exceptional energy or turn of character. In his works the first quality which strikes one is their palatial splendour. The pictorial inspiration is entirely that of the piercing and comprehends eye and the magical hand—not of the mind. The human form and face are given with decorous comeliness, often with beauty; but of individual apposite expression there is next to none. In fact, Paul Veronese is pre-eminently a painter working pictorially, and in no wise amenable to a literary or rationalizing standard. He enjoys a sight much as Ariosto enjoys a story, and displays it in form and colour with a zest like that of Ariosto for language and verse. He was supreme in representing, without huddling or confusion, numerous figures in a luminous and diffused atmosphere, while in richness of draperies and transparency of shadows he surpassed all the other Venetians or Italians. In gifts of this kind Rubens alone could be pitted against him. In the moderation of art combined with its profusion he far excelled Rubens; for, dazzling as is the first impression of a great work by Veronese, there is in it, in reality, as much of soberness and serenity as of brilliancy. By his triumphal cycle of paintings, the most brilliant effect of colour; and yet his hues are seldom bright. He boards his primary tints and his high lights. He very rarely produced small pictures: the spacious was his element.

Of all Veronese's paintings the one which has obtained the greatest world-wide celebrity is the vast "Marriage at Cana," now in the Louvre. It contains about a hundred and twenty figures or heads—those in the foreground being larger than life. Several of them are portraits. Among the personages specified (some of them probably without sufficient reason) are the Marcus Vasti, Queen Eleanor of France, Francis I., Queen Mary of England, Sultan Soleyman I., Vittoria Colonna, Charles V., Tintoretto, Titian, the elder Bassano, Benedetto Caliari and Paul Veronese himself (the figure playing the viol). It is impossible to look at this picture without astonishment. The most striking point from which it fails is that of the New Testament narrative; for there is no relation between the Galilean wedding and Veronese's court-banquet. This stupendous performance was executed for the refectory of the monastery of S. Giorgio Maggiore in Venice, the contract for it being signed in June 1562 and the picture completed in September 1563. Its price was 324 silver ducats (=£160), along with the artist's living expenses and a tun of wine. There are five other great banquet-pictures by Caliari, only inferior in scale and excellence to this of Cana. One of them is also in the Louvre, a "Feast in the House of Simon the Pharisee," painted between 1570-1575 for the refectory of the Servites in Venice. A different version of the same theme is in the Brera Gallery of Milan. The Feast in the "Leper" (1570) was done for the refectory of the monks of St. Sebastian, and the "Feast of Levi" (St Matthew) (1573), now in the Venetian academy, for the refectory of the monks of St. John and St. Paul. In each instance the price barely exceeded the cost of the materials. The Louvre contains ten other specimens of Veronese, notably the "Susanna and the Elders" and the "Supper at Emmaus." In the National Gallery, London, are ten examples. The most beautiful is "St Helena's Vision of the Cross," founded upon an engraving by Marcantonio after a drawing supposed to be the work of Raphael. Far more famous than this is the "Family of Darius at the Feet of Alexander the Great after the Battle of Issus"—the captives having mistaken Hephaestion for Alexander. It was bought for £13,560, and has even been termed (very unreasonably) the most celebrated of all Veronese's works. The
PAUMOTU—PAUNCEFOTE, BARON

principal figures are portraits of the Pisani family. It is said that Caliari was accidentally detained at the Pisani villa at Este, and when he resumed his work, and, on quitting, told the family that he had left behind him an equivalent for his courteous entertainment. Another picture in the National Gallery, "The Europa and the Bull," is a study for the large painting in the imperial gallery of Vienna, and resembles one in the ducal palace of Venice. The Venetian academy contains fourteen works by Veronese. One of the finest is a comparatively small picture of the Battle of Lepanto, with Christ in heaven pouring light upon the Christian fleet and darkness on the Turkish. In the Uffizi Gallery of Florence are two specimens of exceptional beauty—the "Annunciation" and "Esther Presenting herself to Ahasuerus"; for delicacy and charm this latter work yields to nothing that the master produced. In Verona "St George and St Julian," in Brescia the "Martyrdom of St Afra," and in Padua the "Martyrdom of St Justin" are works of leading renown. Celebrated frescoes by Caliari are in four villas near Venice, more especially the Villa Maseria. His drawings are very fine, and he took pleasure at times in engraving on copper.

The brother and sons of Paolo already mentioned, and Battista Zelotti, were his principal assistants and followers. Benedetto Caliari, the brother, who was about ten years younger than Paolo, is reputed to have had a very large share in the architectural backgrounds which form so conspicuous a feature in Paolo's compositions. If this is not overstated, it must be allowed that a substantial share in Paolo's fame accrues to Benedetto; for not only are the backgrounds admirably schemed and limned, but they govern to a large extent the invention and distribution of the groups. Of the two sons Carlo (or Carletto), the younger, is the better known. He was born in 1570, and was sent to study under Bassano. He produced various noticeable works, and died young in 1596. Gabriele, born in 1568, attended, after Carlo's death, almost entirely to commercial affairs; his works in painting were few, and were done after the death of Paolo in finishing his pictures left unfinished.

See Ridolfi, Meraviglie dell'arte, &c.; Dal Pozzo, Vite dei pittori veronesi, &c.; Zanetti, Della Pittura veneziana, &c.; and Lanzi; also, among recent works, the biographies by C. Yriarte (1889); F. H. Meissner (1897); and Mrs Arthur Bell (1904).

PAUMOTU, TUAMOTU, or LOW ARCHIPELAGO, a broad belt of 78 atolls in the Pacific Ocean, belonging to France, between 14° and 24° S., and 131° and 149° W. They trend in irregular lines in a north-west and south-west direction, the major axis of the group extending over 1,300 m. The largest atoll, Rangiroa, with a lagoon 45 m. long by 15 wide, is made up of twenty islets. Fakarava, the next in size, consists of fifteen islets, and its oblong lagoon affords the best anchorage in the group. Hau has fifty islets, and its lagoon is dangerously studded with coral. The symmetrically placed eleven islets of Anaa suggested to Captain Cook the name of Chain Island. Heavy storms sometimes great after the form of the atolls. The first discovery of part of the archipelago was made by the Spaniard Pedro Fernandez Kirou in 1606. Many navigators subsequently discovered or rediscovered various parts of the group—among them may be mentioned Jacob Lemaire and Willem Schouten (1616), John Byron (1765), Phillip Carteret (1767), Louis Antoine de Bougainville (1768), Captain James Cook (1769), Lieutenant Bligh (1792), Captain Wilson of the "Duff" (1797), Otto von Kotzebue (1815 and 1824), Fabian Gottlieb von Bellinghausen (1815-1820) and Charles Wilkes (1839) who made a detailed survey of the islands.

As a result almost all the islands bear alternative names. As the dates given are those of first discovery. In the north-west part of the chain are Rangiroa (Vliegen, Deans or Naira, this part of the group bearing the name of the Palliser Islands); Fakarava (Witgenstein, 1816), the seat of the French-resident; Anaa (Chain, 1769); Makemo (Makima, Phillips, Kutusov, 1803); Hau (Hatt, 1806; Bow, 1768). North and east of these are Manihiki (Ohe, Waterland, 1616), Tiketik (Romanoz, 1815), the Disappointment group (1765) of which Napuka is the chief island, Pukapuka (Henuake, Honden, Dog, 1616), Raroia (Barclay de Tolly, 1820), Angatau (Ahanguat, Arakchev, 1820), Akahaiha (Fakaina, Predproie, 1824), Tatakato (Narcissus, Egmont, Clerke, 1774).

In the southern part of the archipelago are Hareheertui (Bligh, Santalio, 1606), the Duke of Gloucester group (1767), Tematangi (Bligh Lagoon, 1792), Maruroua (Brabugh, Matilda, 1774), the Actaeon or Amphitrite group (discovered by the Tahitian trading vessel "Amphitrite" in 1833), Marutea (Lord Hood, 1791), and the Gambier or Mangareva group (1797), of which Mangareva (Gambier, Peard) is the chief member.

To the south again are: Picairu (q.v.), Ducie, and a few other islets, which are British and do not properly belong to the Paumotu Archipelago. The Gambier Islands are a cluster of four larger and many smaller volcanic islets, enclosed in one wide reef. The wooded crags of Mangareva, the largest islet, 5 m. in length, rise to a height of 1315 ft. and are covered with a rich vegetation, quite Tahitian in character; but, as in the other Paumotus, there is a dearth of animal life.

The climate of the islands is healthy, and they have a lower mean temperature than Tahiti. The easterly trade winds prevail. Rain and fog occur even during the dry season. The stormy season lasts from November to March, when devastating hurricanes are not uncommon and a south-westly swell renders the western shores dangerous. Plants and animals are scantily represented. Coco-nut palms and the pandanus thrive on many of the islets, and the bread-fruit, banana, pine-apple, water-melon and yam have been introduced from Tahiti into the western islands. Mammals are represented by a few rats; among land-birds parakeets, thrushes and doves are noticeable; and of reptiles there are only lizards. Insects are scarce. But the sea and lagoons teem with turtle, fish, molusks, crustaceans and zoophytes. Coral is luxuriant everywhere. From the abundance of pearl oysters the archipelago gets its traders' name of Pearl Islands.

The Paumotus are sparsely inhabited by a fine strong race of Polynesians, more muscular and mostly darker-skinned than that inhabiting Tahiti. In the west considerable intermixture with other races has taken place. In physique, language, religion and customs the Gambier Islanders closely resemble the Rarotongans. The pearl fisheries in the rocky and surf waters are a source of revenue, the pearls being sold in Tahiti. The best harbour of the group is that of Fakarava, which, together with Mangareva, is open to trade.

The land area of the entire group is about 350 sq. m., and the population is about 6000. The group passed under the protection of France in 1844, and was annexed in 1881, forming part of the dependency of Tahiti.

PAUNCEFOTE, JULIAN PAUNCEFOTE, 1st Baron (1828-1902), English diplomatist, third son of Robert Pauncefote of Preston Court, Gloucestershire, was born on the 13th of September 1828. He was educated at Marlborough, Paris and Geneva, called to the bar at the Inner Temple in 1855. He was for a short time secretary to Sir William Molesworth, secretary for the colonies, and in 1862 went out to Hong-Kong, where he was made attorney-general (1865) and then chief justice of the supreme court. He was appointed chief justice of the Leeward Islands in 1873, and, returning to England in the next year, became one of the legal advisers to the colonial office. Two years later he received a similar appointment in the foreign office, and in 1882 was made permanent under-secretary of state for foreign affairs. In 1885 he was one of the delegates to the Suez Canal international commission, and received the G.C.M.G. and the K.C.B. Lord Salisbury departed from precedent in choosing him to succeed Sir Lionel Sackville-West as British minister at Washington in 1889, but the event showed that his knowledge of international law made up for any lack of the ordinary diplomatic training. He did much during his term of office to maintain friendly relations between the two countries, especially during the Venezuelan crisis. The Bering Sea boundary dispute (1890-1892) was successfully negotiated by him; he arranged a draft treaty for Anglo-American arbitration, which was, however, quashed by the Senate; and carried through
the revision of the Clayton-Bulwer Treaty on the subject of the Panama Canal. In 1893 the British minister at Washington was raised to the rank of ambassador, and Sir Julian Pauncefort became the doyen of the diplomatic corps. He died on the 26th of May 1902 at Washington. He had been made Baron Paunceforte of Preston in 1889 in recognition of his services at the Peace Conference at the Hague, and he was a member of the Court of Arbitration which resulted from the conference.

PAUPERISM (Lat. pauper, poor), a term meaning generally the state of being poor, poverty; but in English usage particularly the condition of being a “pauper,” i.e. in receipt of relief administered under the poor law. In this sense the word is to be distinguished from “poverty.” A person to be relieved under the poor law must be a destitute person, and the moment he has been relieved he becomes a pauper, and as such incurs certain civil disabilities. Statistics dealing with the state of pauperism in this sense convey not the amount of destitution actually prevalent, but the particulars of people in receipt of poor law relief.

PAUSANIAS. (5th century B.C.), Spartan regent and commander, of the Agiad family, son of Cleombrotus and nephew of Leonidas. The son of Thermopylae. Upon the death of the latter in 480 B.C. his son Pleistarchus became king, but as he was still a minor the regency devolved first on Leonidas's brother Cleombrotus, and after his death in 479 on Pausanius. He first distinguished himself as commander of the combined Greek forces in the victory of Plataea. In 478 he was appointed admiral of the Greek fleet, and succeeded in reducing the greater part of Cyprus, the strategic key of the Levant, and in capturing Byzantium from the Persians, thus securing the command of the Bosporus, and of the route by which Darius had invaded Europe. But he entered into treacherous negotiations with the Persian king, and his adoption of Oriental dress and customs, and his haughty behaviour to the Greeks under his command, roused their resentment and suspicion (see DElIAN LEAGUE).

Pausanius was recalled by the ephors and, though acquitted on the main charge of Medism, was not again sent out in any official position. He returned to Byzantium, nevertheless, in a ship of Hermion and seized that town and appoints Sestos also. He was dislodged from both by the Athenians, to whom the allies had transferred from Sparta the naval hegemony. For some time he lived at Cleone in the Troad, carrying on negotiations with Xerxes, but was again recalled to Sparta, where he incited the helots to revolt. When his schemes were almost matured, the evidence of a confidential slave led to the discovery of his plot by the ephors. He fled to the sanctuary of Athena Chalcioceu on the Spartan Acropolis: there he was immured, and when starvation and exposure had all but done their work he was dragged out to die. This crime against religion the state subsequently expiated by the burial of his body at the spot where he died and the dedication of two bronze statues. To commemorate Leonidas and Pausanius a yearly festival was held, at which speeches were made extolling their victories; this was still celebrated when the geographer Pausanius visited Sparta more than six centuries later (Paus. ii. 14). The site of the latter is in the city-plain, although it is thought to have been originally assigned to it a later date on a very doubtful statement of Justin (ix. 1) that Pausanius held Byzantium for seven years.

See Herodotus v. 32, ix. 10-88; Thucydides i. 54-56, 128-134, ii. 71, 77, 78, 87, 93, 109, 121; Diodorus Siculus x. 39-41, 53, 57, Canusianus N. Pausanias: Justin i. 15, ix. 1, 3; Pausanias ii. 4, 14, 17; Polyainus vii. 51; Aristodemos ii., vi. viii.; Athenaeus xii. 53B, 53D; Plutarch, Cimon 6, Thesmophoria 23, Aristides 11-20, 23; N. Hialske, Uber den Konigregen Pausanias (Leipzig, 1893). (M. N. T.)

PAUSANIAS, Greek traveller and geographer of the 2nd century A.D., lived in the times of Hadrian, Antoninus Pius and Marcus Aurelius. He was probably a native of Lydia, and was possibly born at Magnesia ad Sipyolum; he was certainly interested in Pergamum and familiar with the western coast of Asia Minor; but his travels extended far beyond the limits of Ionia. Before visiting Greece he had been to Antioch, Joppa and Jerusalem, and to the banks of the river Jordan. In Egypt he had seen the pyramids and had heard the music of the vocal Meso, and whilst at the temple of Ammon he had been shown the hymn once sent to that shrine by Pindar. He had taken note of the fortifications of Rhodes and Byzantium, had visited Thessaly, and had gazed on the rivulet of “blue water” beside the pass of Thermopylae. In Macedonia he had almost certainly viewed the traditional tomb of Orpheus, while in Epirus he was familiar with the oracular oak of Dodona, and with the streams of Acheron and Cocytus. Crossing over to Italy, he had seen something of the cities of Campania, and of the wonders of Rome.

His Description of Greece (περίγραφη τῆς Ἑλλάδος) takes the form of a tour in the Peloponnesus and in part of northern Greece. It is divided into ten books: (i.) Attica and Megara; (ii.) Argolis, including Mycenae, Tiryns and Epidaurus; (iii.) Laconia; (iv.) Messenia; (v.) and (vi.) Elis, including Olympia; (vii.) Achaea; (viii.) Arcadia; (ix.) Boeotia, and (x.) Phocis, including Delphi.

Book i. was written after Herodes Atticus had built the Attic Stadion (A.D. c. 143), but before he had built the Odeum (c. 160-161). There is reason to believe that this book was published some years before the rest. The statement in book v. (1, 2), that 275 years had elapsed since the restoration of Corinth (44 B.C.), shows that Pausanius was engaged on his account of Elis in the year A.D. 174, during the reign of Marcus Aurelius. He repeatedly refers to buildings erected by Hadrian, who died in A.D. 138. He had lived in that emperor’s time; but had not actually seen that emperor’s favourite, Antoninus, who died about 130. He mentions the wars of Antoninus Pius against the Moors, and of Marcus Aurelius (in and after A.D. 166) against the Germans (vii. 43). The latest event which he records is the incursion of the robber-herds of the Costoboc (A.D. c. 175; x. 34, 5). Book i. having been published before 150, and books vi.-x. after 174, the composition of the whole must have extended over more than fourteen years.

The work has no formal preface or conclusion. It suddenly begins with the promontory of Sunium, the first point in Attica which would be seen by the voyager from the shores of Asia Minor, and it ends abruptly with an anecdote of a blind man of Naupactus. The author’s general aim may be inferred from his saying at the close of his account of Athens and Attica: “Such (in my opinion) are the most famous of the Athenian traditions and sights; from the mass of materials I have aimed from the outset at selecting the really notable” (i. 39, 3). It is possibly in the hope of giving variety and interest to the topographical details of Athens that the author intersperses them with lengthy historical disquisitions; but the result is that the modern reader is tempted to omit the “history” and to hasten on to the “topography,” on which the author now is a primary authority. In the subsequent books he introduces two improvements. His account of each important city begins with a sketch of its history; and, in his subsequent descriptions, he adopts a strictly topographical order. He takes the nearest road from the frontier to the capital; he there makes for the central point, and all the more notable deserts in succession the several streets radiating from that centre. Similarly in the surrounding district, he follows the principal roads in succession, returning to the capital in each case, until, at the end of the last road, he crosses the frontier for the next district. In the later books he supplies us with a few glimpses into the daily life of the inhabitants. He is constantly describing ceremonial rites or superstitious customs. He frequently introduces narratives from the domain of history and of legend and folklore; and it is only

1 The tomb of Helena at Jerusalem, which Pausanias viii. 16, 4-5, compares with the Mausoleum, is mentioned by Josèphus, Ant. xiii. 21, 5; B. J. vi. 21, 7, 31, 4; J. G. Schneller, B. E. ii. 12, 3. Helen, the daughter of Iazes, king of Adiabene, sent large shipsloads of provisions to Rome during the great famine in the time of Claudius (A.D. 44-46). Her tomb is identified by universal consent with the so-called “Tombs of the Kings,” half a mile north of the Damascus gate. Cf. Schrüber, Geschichte des jüdischen Volkes, 3rd ed., iii. 120-122; view of tomb in Picturèrise Palestine, i. 109.
rarely that he allows us to see something of the scenery. But, happily, he notices the pine-trees on the sandy coast of Elis, the deer and the wild boars in the oak-woods of Phellus, and crows amidst the giant oak-trees of Alacmenae. He tells us that “there is no fairer river than the Ladon,” “no reeds grow so tall as those in the Boeotian Asopus,” and the rain that deluges the flood plain of Mantinea vanishes into a chasm to rise again elsewhere. It is mainly in the last three books that he touches on the products of nature, the wild strawberries of Helicon, the date-palms of Aulis, and the olive-oil of Tithorea, as well as the bustards of Phocis, the tortoises of Arcadia and the “white blackbirds” of Cyllene. He is rather reticent as to the character of the roads, but he records, with the gratitude of a traveller, the fact that the narrow and perilous cornice of the Scironian way along the coast of Megara had been made wider and safer by Hadrian. He is inspired by a patriotic interest in the ancient glories of Greece, recognizing in Athens all that was best in the old Greek life, and lamenting the ruin that had befallen the land on the fatal field of Chaeronea. He is most at home in describing the religious art and architecture of Olympia and of Delphi; but, even in the most secluded regions of Greece, he is fascinated by all kinds of quaint and primitive images of the gods. He is particularly fond of the buildings of Athens. He is interested in visiting the battlefields of Marathon and Plataea, and in viewing the Athenian throne on the island of Salamis, the grave of Demosthenes at Calauria, of Leonidas at Sparta, of Epaminondas at Mantinea, and the colossal lion guarding the tomb of the Thebans on the Boeotian plain. At Thebes itself he views the shields of those who died at Leuctra, and the ruins of the house of Pindar; the statues of Hesiod and Arion, of Thamyris and Orpheus, in the grove of the Muses on Helicon; the portrait of Corinna at Tanagra, and of Polybius in the cities of Arcadia. At Olympia he takes note of the ancient quoit of Iphitus inscribed with the terms of the Olympic truce, the tablets recording treaties between Athens and other Grecian states, the memorials of the victories of the Greeks at Platea, of the Spartans at Tanagra, of the Messenians at Naupactus, and even those of Philip of Chaeronea and of Mummius at Corinth. At Delphi, as he climbs the sacred way to the shrine of Apollo, he marks the trophies of the victories of the Athenians at Marathon and on the Eurymedon, of the united Greeks at Aegospotami, of the Spartans, and the temple of Apollo, of the Aeginetans in the Potamides, of the Thebans at Leuctra, and the shields dedicated in memory of the repulse and defeat of the Gauls by Delphi itself. At Athens, he sees pictures of historic battles, portraits of famous poets, orators, statesmen and philosophers, and inscriptions recording the laws of Solon; on the Acropolis, the trophy of the Persian wars, the great bronze statue of Athens; at the entrance to the harbour of the Peiraeeus, the grave of Themistocles; and, outside the city, the monuments of Harmodius and Aristogeiton, of Cleisthenes and Pericles, of Conon and Timotheus, and of all the Athenians who fell in battle, except the heroes of Marathon, “for these, as a mead of valour, were buried on the field.”

In the topographical part of his work, he is fond of digressions on the wonders of nature, the signs that herald the approach of an earthquake, the phenomena of the tides, the ice-bound seas of the north, and the noonday sun which at the summer solstice casts no shadow at Syene. While he never doubts the existence of the gods and heroes, he sometimes criticizes the myths and legends connected with them. His opinion in this respect is in the category of ancient art, and he prefers the works of the 5th and 4th centuries B.C. to those of later times. At Delphi he admires the pictures of Polygnotus, closing the seven chapters of his minute description with the appellative phrase: “so varied and beautiful is the painting of the Thasian artist” (x. 31, 2). In sculpture his taste is no less severe. Even in the “uncouth” work of Daedalus, he recognizes “a touch of the divine” (ii. 4, 5). In architecture, he admires the prehistoric walls of Tiryns, and the “Treasury of Minyas,” the Athenian Propylaea, the theatre of Epidaurus, the temples of Bassae and Tegea, the walls of Messene, the Odeum at Patrae, as well as the building of the same name lately built at Athens by Herodes Atticus (vii. 20, 6), and finally the Stadeum which that munificent Athenian has faced with white marble from the quarries of Penteale on the coast of Phocis. Homer has described the “seven-fountained art” of Paris, and he has given a fine picture of the plain and unadorned; they bear the impress of reality, and their accuracy is confirmed by the extent remains. He is perfectly frank in his confessions of ignorance. When he quotes a book at second hand he takes pains to say so.

He has been well described by J. G. Frazer as “a man made of common stuff and cast in a common mould; his intelligence and abilities seem to have been little above the average, his opinions not very different from those of his contemporaries.” His literary style is “plain and unadorned yet heavy and laboured”; it is not careless or slovenly; the author tried to write well, but his “sentences are devoid of rhythm and harmony” (Introduction, pp. xlix., lxxix.).

In considering his use of previous writers, we must draw a distinction between the historical and the descriptive parts of his work. In the former it was necessary for him to depend on written or oral testimony; in the latter it was not. In the historical passages, his principal poetic authority is Homer; he frequently quotes the Theogony of Hesiod, and he often refers to Aeschylus, Sophocles, and Euripides, Hesiodus, and his debt to Thucydides and Xenophon extends beyond the isolated mention of their names (i. 3, 4; vi. 19, 5). He has carefully studied the Etean register of the Olympic victors; he makes large use of inscriptions, and has generally examined them with care and copied them with accuracy. In the descriptive portion the question arises whether he derived his knowledge from personal observation, or from books, or from both. He does not profess to have seen everything, but he does not acknowledge that he has borrowed any of his descriptions from previous writers. He “cannot commend the men who took the measurements” of the Zeus at Olympia (v. 11, 9). “A certain writer,” who states that a particular spring is the source of an Arcadian river, “cannot have seen the spring himself, or spoken with any one who had; I have done both” (viii. 41, 10). There are fifty passages in which he either directly states or implies that he had seen the things that he describes. All of these have been carefully collected and examined by R. Heberdey (1894), who, by using a distinctive type in marking them, has made it possible for the student desiring to join those places by lines representing the routes described by him, has shown the large extent of the author’s travels in Greece. The complicated coast of Hermionis has, however, been incorrectly described (ii. 34, 8 seq.), and there is some confusion in the account of the three roads leading to the north from Lepreis, in the extreme south of Elis (v. 5, 3).

A greater difficulty has long been felt in connexion with the “Enneacrusus episode” in the description of Athens (i. 8, 6, and 14, 1-6). In the midst of the account of the market-place, north-west of the Acropolis, the reader is transported to the fountain of Enneacrusus and to some buildings in its neighbourhood, and is suddenly brought back to the market-place. It has been naturally assumed that the Enneacrusus can only be the fountain of that name in the bed of the Ilissus. If so, the description of the fountain is out of place, and its insertion at this point has been explained by Dr Dörpfeld by the conjecture that the name Enneacrusus was originally applied to a spring west of the Acropolis, that the old name of this spring, Callirrhoe, had been abandoned from the time when Peisistratus converted it into a “fountain with nine streams by which he pens in the neighing of oxen as the waters were drawn to another fountain in the bed of the Ilissus. The evidence of his own excavations has led him to place the original Enneacrusus near the eastern foot of the hill of the Phyx, and to identify certain adjacent remains with what is there mentioned by Pausanias. If this opinion is correct, the account of the Enneacrusus, and the neighbouring buildings, in Pausanias, ceases to be an “episode,” and falls into the natural sequence of the narrative. (The “episode” has been fully discussed by the expounders and translators of Pausanias, and by the writers on the topography of Athens. Dr Dörpfeld’s views are clearly set forth in Miss J. E. Harrison’s Primitive Athens (1906). A. Malin’s paper (Vienna,
The account of the law courts of Athens and of the altars at Olympia may have been derived from monographs on those subjects. In both cases the author departs from his usual method of following the order of place, and deals with a group of monuments belonging to the same class. But in the extant literature of antiquity (as J. G. Frazer has shown) no passage has been found agreeing in form or substance so closely with the description in Pausanias as to make it probable that he copied it. The theory that Pausanias borrowed largely from Polemon of Ilium, who flourished about 200–177 B.C., and wrote on the Acropolis and the eponymous heroes of Athens, on the treasuries of Delphi, and on other antiquarian topics, was incidentally suggested by Preller in his edition of the fragments (1839), and was revived by Professor von Wilamowitz-Moellendorff in 1877 (Herms, xli. 346). It was subsequently maintained by A. Kalkmann (1886) that Pausanias slavishly copied from Polemon the best part of his descriptions of Athens, Delphi and Olympia, and described those places, not as they were in his own age, but as they had been in that of Polemon, some 300 years before. It is alleged that, in the notices of the monuments on the Acropolis of Athens, and of the sculptors and the athlete-statues of Olympia, the lower limit of Pausanias is practically 150 B.C.; it is inferred that the authority followed by him ended with this date, and it is more than suggested that his sole authority was Polemon. But the comparative neglect of works later than 150 B.C. might also be explained by the fact that the independence of Greece came to an end in 146. And, further, it so happens that Pausanias refers to very few sculptors for the 140 years (295–156 B.C.) before the age of his supposed authority, while some of the sculptors represented at Olympia have since been placed after that date, and only a few of the Athenian monuments described by Pausanias belong to the period between that date and the accession of Hadrian, or, approximately, the period between about 166 B.C. and A.D. 117 (Gurllt, Uber Pausanias, pp. 117 seq., 194 seq., 257–267). More than one hundred extracts from, or reference to, the works of Polemon have come down to us, and it has been shown by Mr Frazer that “the existing fragments hardly justify us in supposing that Pausanias was acquainted with the writings of his learned predecessor; certainly they lend no countenance to the view that he borrowed descriptions of places and monuments from them.” Again, it has been urged that his brief description of the Pelaeus is not true of his own time, as it had been burnt by Sulla (86 B.C.), and was still lying desolate in the age of Augustus, but his account of the buildings and monuments has been confirmed by an inscription conjecturally ascribed to the time of Pausanias (Frazer II. 14 seq.). It has also been stated that the description of Arcadia must have been borrowed from far earlier writers, because Strabo (p. 388) says that most of the famous cities of that land had either ceased to exist or had left hardly a trace behind them; but the evidence of coins has proved that at least seven of the eleven cities described by Pausanias were still in existence long after the death of Strabo. It has further been assumed that his account of the temple of Apollo at Delphi is “irreconcilable with the remains of the building” and with the inscriptions recently discovered by the French archaeologists. We are told that Pausanias describes the temple of the 6th century B.C. as if it still existed in his own time. On the contrary, he states that the first sculptures for the gables were executed by a pupil of Calamis, the pupil of a sculptor still at work in 347 B.C., and the shields that he saw suspended on the architrave were carried on in 279. Again, his description of the Acropolis, built in 44 B.C., more than 150 years after the time of Polemon, is most minute and systematic, and it is confirmed by coins of the imperial age. In at least one important point Pausanias compares favourably with Strabo. While Strabo erroneously declares that not a vestige of Mycenae remains, Pausanias gives a brief but accurate description of the Lion-gate and the existing circuit-wall of the Acropolis, with a notice of the tombs within the wall (ii. 16, 5–7), a notice which led to their discovery by Schliemann. In all parts of Greece the accuracy of his descriptions has been proved by the remains of the buildings which he describes; and a few unimportant mistakes (in v. 10, 6 and 9; viii. 37, 3, and 45, 5), and some slight carelessness in copying inscriptions, do not lend any colour to an imputation of bad faith. It has been stated with perfect justice by Frazer (p. xxv. seq.) that “without him the ruins of Greece would for the most part be a labyrinth without a clue, a riddle without an answer.” “His book furnishes the clue to the labyrinth, the answer to many riddles. It will be studied so long as ancient Greece shall continue to engage the attention and awaken the interest of mankind.”

Special Literature. Descriptive and monographic, estimated by Mr G. Frazer's excellent Translation and Commentary. See also C. Krieger, Pausanias, ed. by J. Seidler, Munich, 1882 (2d ed.); Frazer's Paean, ed. by W. Ehrhard, Berlin, 1890, 1897; Mr H. G. Liddon's Periegese Athenarum, ed. by D. Appianus and C. T. Schubart (Bonn, 1876); and in Archäologischer Anzeiger (1895), p. 12; opposed by W. Gurlitt, Uber Pausanias (Graz, 1890), 494 pp.; Beneker, Anteil der Periegese an der Kunsthistorie (1890), and R. Beberley, Die Reisen des Pausanias in Griechenland, with two maps (Heidelberg, 1894).

The present writer is much indebted to Gurlitt's comprehensive monograph, and to the admirable Introduction prefixed to G. Frazer's excellent Translation and Commentary. See also C. Krieger, Pausanias, ed. by J. Seidler, Munich, 1882 (2d ed.); Frazer's Paean, ed. by W. Ehrhard, Berlin, 1890, 1897.

Pausanias, a Greek painter of the 4th century, of the school of Sicyon. He introduced the custom of painting ceilings of houses. His great merit appears to have lain in the better rendering of foreshortening. The words in which Pliny (xxxv. 127) describes a bull painted by him should be quoted: "Wishing to display the length of the bull's body, he painted it from the front, not in profile, and yet fully indicated its measure. Again, while others fill in with white the high lights, and paint in black what is less salient, he painted the whole bull of dark colour, and gave substance to the shadow out of the shadow itself, with great skill making its figures stand out from a flat background, and indicating their shape when foreshortened." This passage well marks the state of painting at the time.

Pavane, Payan or Favin, the name of a slow stately dance of the 16th and 17th centuries. The word has been variously derived: (1) from Lat. pav, peacock; the dancers, as they wheel and turn, spread out their long cloaks, which they retained in this dance, like the tail of the bird; (2) from Padova, i.e. of Padua, in Italy; the dance, however, is usually taken to have come from Spain. As an instrumental composition, common in the 16th and 17th centuries, the “pavane” was usually followed by the quick and lively “galliard,” as the “gigue” followed the “saraband” in the later suite (see Dance).

Pavement (Lat. pavimentum, a floor beaten or rammed hard, from pavire, to beat), a term originally applied to the covering of a road or pathway with some durable material, and so used of the paved footway at the side of a street—the “sidewalk” as opposed to the roadway proper. The term is also extended to the interior floor of churches and public buildings. Early pavements consisted only of rammed clay, as in the “beehive” tombs of Mycenae, or of cement or stucco decorated with lines in coloured marls, as those mentioned in the Book of Esther (vi. 1) in the palace at Susa. W. M. Flinders Petrie discovered at Tello el Amarna in the palace of Akhenaton the remains of a stucco pavement, decorated with foliage, flowers, birds, &c., and a complete naturalistic treatment. The threshold of the doors of the Assyrian palaces were of stone carved with patterns in imitation of those in a
The pavements of Greek temples were either in stone or marble, and at Olympia the pronaoes of the temple of Zeus was laid in mosaic representing tritons, and the floor of the cella was in coloured marbles. The Roman pavements were invariably in mosaic, sometimes of a very elaborate nature, as in the House of the Faun at Pompeii, where the mosaic represented the battle of Issus between Alexander the Great and Darius III, a reproduction probably of some Greek painting of the period. In Rome the palaces on the Palatine Hill and the thermae were all paved with mosaic, and numerous pavements have been found in Carthage, many of which are in the British Museum, as are also examples from the Roman villas in England. Perhaps the richest Roman pavements outside Italy are those at Trèves in Germany. The Roman tradition was continued by the Byzantine architects, who, throughout the East, paved their churches with mosaics, frequently of the same design and execution as those of the Romans, but with Christian symbols. The churches of the Romanesque, Gothic and Renaissance periods were all paved in marble, but of a different character from those of the earlier period (see MOSAIC).

PAVIA (anc. Ticinum, q.v.), a town of Lombardy, Italy, capital of the province of Pavia, situated on the Ticino about 2 m. S. of Milan, by 253 ft. above sea-level. Pop. (1906), 28,706 (town), 36,424 (commune). On the right bank of the river lies the small suburb of Borgo Ticino, connected with the town by a remarkable covered bridge dating from 1351–1354. In 1872 the city ceased to be a fortress, and the bastions have been transformed into boulevards and public gardens. The church of San Michele Maggiore is one of the finest specimens of the Lombard style in existence, and as it was within its walls that the crown was placed on the head of those "kings of Italy" from whom the house of Savoy claims descent it was by royal decree of 1863 given the title of Basilica Reale. S. Michele (for plan see Architecture: § Romanesque and Gothic in Italy) was originally constructed under the Lombard kings, but was burnt in 1004, and the present building dates from the latter part of the 11th (crypt, choir and transepts) and the first half of the 12th centuries (façade and nave with two aisles), and was completed in 1155. The lower part of the façade is adorned with three fine portals, each relieved of a fantastic kind in sandstone, among which is the holy water font, supported by figures of angels, the whole being considered as an object of great beauty and value. The interior is barrel-vaulted. The dome is octagonal. The interior is vaulted and has eight pillars, supporting double round arches. The interior has a mosaic pavement of the 12th–13th centuries. The cathedral church of San Martino is a Renaissance building begun in 1488 by Cristoforo Rocchis; it is a vast "central" structure, finely designed, with four arms, which remained for centuries unfinished until the dome (only surpassed by those of St Peter at Rome and the cathedral at Florence) and façade were completed in 1808 according to Rocchis's still extant model; adjoining the church is the massive Torre Maggiore, 258 ft. high, which is mentioned as early as 1330. The upper part is due to Pellegrino Tibaldi (1533). The cathedral contains the tomb of S. Syrus, first bishop of Pavia (2nd century); an altar-piece (1521), the best work of Giampietro Rizzi (1522), a pupil of Leonardo da Vinci; and another, the masterpiece of Bernardino Gatti of Parma (1532). The church of S. Pietro in Ciel d'Oro, the origin of which dates from the beginning of the 6th (7th) century, but which as it stands was consecrated in 1138, is very similar to S. Michele in respect of its façade (though it has not the elaborate semi-dome and mosaic pavements. The use of disks of majolica may be noted in the decoration of the exterior. It has been carefully restored. It served as the burial place of the Lombard king Liutprand (711–744), whose bones were found there in 1896 (R. Majocchi in Nuovo bulletin d'archeologia cristiana, 1896, p. 139). The Arca di S. Agostino (after 1362) is a sumptuous tomb containing the relics of S. Augustine of Hippo brought hither by Liutprand from Sardinia. It was only restored to this, its original position, from the cathedral when the church itself was restored.

The church of S. Maria del Carmine is externally one of the most beautiful of the brick Gothic churches in northern Italy and dates from 1273 (or 1275). S. Francesco has also a good façade dating from the first half of the 13th century. The church of S. Maria di Canepanova with its small dome was designed by Bramante. Near it are three tall, slender brick towers of the Gothic period. S. Teodoro with a 12th-century exterior has frescoes by Bartolomeo Suardi (Bramantino) after 1507. Outside the town on the west lie the churches of S. Salvatore (founded in the 7th century but rebuilt in the 15th and 16th), and of S. Lanfranc (or the Holy Sepulchre, 12th century) with the fine tomb of Bishop Lanfranco Becci (d. 1180) by Giovanni Antonio Amedeo (1498), one of the best Lombard sculptors and architects of this period (1447–1532) and a native of Pavia, which has a few other works by him. He was for eighteen years in charge of the work at the Certosa. Interesting medieval views of Pavia exist in the churches of S. Teodoro and S. Salvatore; the former dating from 1322 has been published by F. Morighi in Bullettino storico paese (1863), i. 41 sqq. (See Magenta, I Visconti e gli Sforza nel castello di Pavia (Milan, 1884), for other medieval plans).

Of the secular buildings the most noteworthy is the university founded by Galeazzo II. in 1381 on the site of a law school after the latter was in ruins (1280), where there now is a Pavia a centre of study as early as A.D. 825. The present imposing building was begun by Lodovico il Moro in 1490; in the library there are preserved some of the ashes of Columbus, who was a student here. Volta made here his first electrical experiments. For the maintenance of a number of poor students there are two subsidiary colleges, the Borromeo and the Ghislieri founded by S. Carlo Borromeo (1563) and Pope Pius V. (1569); of the latter a colossal bronze statue has been erected in the piazza before his college. The university of Pavia has long been famous as a medical school, and has the oldest anatomical cabinet in Italy; in addition it has a natural history museum founded under Spallanzini in 1772, a botanical garden, begun in 1774, and excellent geological, palaeontological and mineralogical collections. The old castle of the Visconti built in 1360 for Galeazzo II. is used as barracks. The Museo Civico is housed in the Palazzo Malaspina and contains many interesting national relics and a small picture gallery, with a large collection of offprints on paper from niello plates, including a very fine "Fountain of Life" in which is a dish brought from by the Duke of Sardinia. The Palazzo Mezzabarba, now used as the Municipio, is the former palace of the Counts of Pavia.

Pavia has a number of iron-works, military engineering and electrical production works, and other factories, as well as a large covered market, built in 1882. Pavia lies on the main line from Milan to Genoa (which crosses the Ticino by a bridge half a mile long, and shortly afterwards the Po), with several branch lines. Barges from Pavia can pass down the Po to the Adriatic or to Milan by canal. Five miles north of Pavia is the Carthusian monastery of Certosa di Pavia, one of the most magnificent in the world. Its founder Gian Galeazzo Visconti (also the founder of Milan Cathedral) laid the first stone in August 1366, and the nave was then begun in the Gothic style, but was not completed until 1465. However the influence of the Early Renaissance had meanwhile become supreme throughout Italy, and the rest of the church with its external arcaded galleries and lofty pinnacles (including the main dome and the cloisters were executed in the new style under Guiniforte Solari (1452–1498) with details in terra-cotta of great refinement and beauty. The completion of the cenotaphs in 1468, and the lower part of the façade was finished in 1497. It is perhaps the finest piece of elaborate and richly adorned Renaissance architecture in existence, and is the work of a number of different artists. In the south transept of the church is the tomb of the founder; the figure of Galeazzo guarded by angels lies under a marble canopy, with the Madonna in a niche above. It was begun in 1494–1497 by Giovanni Cristoforo Romano and Benedetto Briosco, but was not finished until 1562. In the north transept is the tomb of Lodovico Sforza, il Moro, and his wife, the figures on which were brought from S. Maria della Grazie in 1564 when the monument of the prince in
that church was broken up and sold; these statues are considered to be one of the chief works of Cristoforo Solari. The church contains numerous other works of art. An elegant portal leads from the church into the small cloister, which has a pretty garden in the centre; the terra-cotta ornaments surmounting the slender marble pillars are the work of Rinaldo de Staursis (1465–1478), who executed similar decorations in the great cloister. This cloister is 412 ft. long by 334 ft. wide and contains 24 cells of the monks, pleasant little three-roomed houses each with its own garden. Within the confines of the monastery is the Palazzo Ducale which since 1901 has been occupied by the Certosa museum. The Carthusian monks, to whom the monastery was entrusted by the founder, were bound to employ a certain proportion of their annual revenue in prosecuting the work till its completion, and even after 1542 the monks continued voluntarily to expend large sums on further decoration. The Certosa di Pavia is thus a practical textbook of Italian art for well-nigh three centuries. The Carthusians were expelled in 1782 by the emperor Joseph II., and after being held by the Cistercians in 1784 and the Carmelites in 1789 the monastery was closed in 1810. In 1843 the Certosa was restored to the Carthusians and was exempted from confiscation in 1866, but it has since been declared a national monument.

History.—For earlier period see Ticinum. Under the name Pavia (Pavia) the city became, as the capital of the Lombard kingdom, one of the leading cities of Italy. By the conquest of Pavia and the capture of Desiderius in 774 Charlemagne completely destroyed the Lombard supremacy; but the city continued to be the centre of the Carolingian power in Italy, and a royal residence was built in the neighbourhood (Cortolona on the Olona). It was in San Michele Maggiore in Pavia that Berengar of Friuli, and his quasi-regal successors down to Berengar II. and Adalbert II., were crowned "kings of Italy." Under the reign of the first the city was sacked and burned by the Hungarians, and the bishop was among those who perished. At Pavia was celebrated in 951 the marriage of Otto I. and Adelheid (Adelaide), which exercised so important an influence on the relations of the empire and Italy; but, when the succession to the crown of Italy came to be disputed between the emperor Henry II. and Arduin of Ivrea, the city sided strongly with the latter. Laid in ruins by Henry, who was attacked by the citizens on the night after his coronation in 1004, it was none the less ready to close its gates on Conrad the Salic in 1026. In the 11th and 12th centuries we find Pavia called the "Second Rome." The jealousy between Pavia and Milan having in 1056 broken out into open war, Pavia had recourse to the hated emperors, though she seemed to have no real fear of them, and in 1059 the emperor Henry IV. was led to Pavia. The city was fortified for the most part she remained attached to the Ghibelline party till the latter part of the 14th century. From 1360, when Galeazzo was appointed imperial vicar by Charles IV., Pavia became practically a possession of the Visconti family and in due course formed part of the duchy of Milan. For its insurrection against the French garrison in 1490 it paid a terrible penalty in 1500, and in 1512, after the victory of Ravenna, Pavia presented to Louis XII., as a sign of fidelity, a magnificent standard: this however fell into the hands of Swiss mercenaries and was sent to Fribourg as a trophy of war (it no longer exists). Having been strongly fortified by Charles V., the city was in 1525 able to bid defiance to Francis I., who was so disastrously beaten in the vicinity, but two years later the French under Lautrec subjected it to a sack of seven days. In 1655 Prince Thomas of Savoy invested Pavia with an army of 20,000 French, but had to withdraw after 32 days' siege. The Austrians under Prince Eugène occupied it in 1706, the French in 1713 and the French and Spaniards in 1743, and the Austrians were again in possession from 1746 till 1756. In May of that year it was seized by Napoleon, who, to punish it for an insurrection, condemned it to three days' pillage. In 1814 it became Austrian once more. The revolutionary movement of February 1848 was crushed by the Austrians and the university was closed; and, though the Sardinian forces obtained possession in March, the Austrians soon recovered their ground. It was not till 1859 that Pavia passed with the rest of Lombardy to the Sardinian crown.

At several periods Pavia has been the centre of great intellectual activity. It was according to tradition in a tower which, previous to 1584, stood near the church of the Annunziata that Boethius wrote his De consolatione philosophiae; the legal school of Pavia was rendered celebrated in the 11th century by Lanfranc (afterwards archbishop of Canterbury); Petrarch was frequently here as the guest of Galeazzo II., and his grandson died and was buried here. Columbus studied at the university about 1465; and printing was introduced in 1471. Two of the bishops of Pavia were raised to the papal throne as John XIV. and Julius III. Lanfranc, Pope John XIV., Porta the anatomist and Cremona the mathematician were born in the city.

See C. Dell' Acqua, Guida illustrata di Pavia (Pavia, 1900), and refs. there given; L. Beltrami, La Chartreuse de Pavia (Milan, 1869); Storia documentata della Certosa di Pavia (Milan, 1896). (T. A.)

Pavia y Albuquerque, Manuel (1828–1893), Spanish general, was born at Cadiz on the 2nd of August 1828. He was the son of Admiral Pavia, a naval officer of some note in the early part of the 19th century. He entered the Royal Artillery College at Segovia in 1841; became a lieutenant in 1846, a captain in 1855 and major in 1862. Three years later he joined the staff of Marshal Prim, and took part in the two unsuccessful revolutionary movements concerted by Prim in 1866, and, after two years of exile, in the successful revolution of 1868. Pavia showed much vigour against the republican risings in the southern provinces; the governments of King Amadeus of Savoy, from 1871 to 1873, also showed him much favour. After the abdication of that prince, General Pavia put down the Carlists and the cantonal insurrections of the chief towns of the south. On three occasions during the eventful year 1873, as captain-general of Madrid, he offered his services to put an end to the anarchy that was raging in the provinces and to the disorganization prevalent in the Cortes. To all he used the same arguments, namely, that they had to choose between an Alphonsoist restoration or a dictatorial, military and political republic, which would rally round its standard all the most conservatıve groups that had made the revolution of 1868. He hoped to realize with Castelar, but the plan was interrupted by the military pronunciamiento for the purpose of dissolving the Cortes of 1873. As soon as the federal Cortes had defeated Castelar, Pavia made his coup d'état of the 3rd of January 1874, and after the pronunciamiento was absolute master of the situation, but having no personal ambition, he sent for Marshal Serrano to form a government with Sagasta, Martos, Ulloa and other Constitutional and radicals of the revolution. Pavia sat in the Cortes of the Restored Monarchy, and defended himself skilfully against Emilio Castelar, who upbraided him for the part he had played on the 3rd of January 1874. He died suddenly on the 4th of January 1895.

Pavilion, properly a tent, a late use of Lat. papilio, butterfly, from which the word is derived through the French. The term is chiefly used of a tent with a high pitched roof, a small detached building used as a summer-house, &c., and particularly for a building attached to a recreation ground for the use of players and members. In architecture the term pavilion is specifically applied to a portion of a building which projects from the sides or central part. It is a characteristic of French renaissance architecture. Where the buildings of a large institution are broken up into detached portions, as in St Thomas's Hospital, London, the term is generally applied to such detached buildings.

For the musical instrument known as the Chinese pavilion or Jingling Johnny, see CHINESE PAVILION. 

Pavis, or Pavise, a large convex shield, some 4 to 5 ft. high and sufficiently broad to cover the entire body, used in medieval warfare, as a protection against arrows and other missiles. The word appears in innumerable forms in Old French, Italian and Medieval Latin, and is probably to be referred to Pavia, in Italy, where such shields were made. The term "pavisade" or "pavesade" was used of a portable screen of
hurdles behind which archers might find protection, or of a similar defensive screen formed by linking together “pavises,” especially on board a ship of war extending along the bulwarks, and hence in later times of a canvas screen similarly placed to conceal the rowers in a galley or the sailors on other types of ships.

PAVLOVO, a town in Russia, in the government of Nizhniy-Novgorod, 42 m. S.W. of the town of Nizhniy-Novgorod, on the Oka river. Pop. (1897), 12,200. It is the centre of a considerable cutlery, hardware and locksmith trade, which, carried on since the 17th century in cottages and small workshops, engages, besides Pavlovo itself, no less than 120 villages. There are also steel works and cotton, silk, soap and match factories. Pavlovo has a museum of cutlery models and a library.

PAVLOVO POSAD, or Vokhna, a town in Russia, in the government of Moscow, 41 m. by rail E. of the city of Moscow, on the Klyazma river. Pop. (1897), 10,030. It is the centre of a manufacturing district, with silk, cotton and woollen mills, and dyeing and printing works.

PAVLOVSKY, a town in Russia, in the government of St. Petersburg 17 m. by rail S. of the city of St Petersburg. Pop. (1897), 4049. It has an imperial castle (1782-1803) standing in a beautiful park and containing a small fine art museum and gallery. In the vicinity are smaller imperial palaces and summer residences of St Petersburg families.

PAWN. (1) A pledge, an object left in the charge of another, as security for the repayment of money lent, for a debt or for the performance of some obligation (see Pawning). The word is an adaptation of O. Fr. pan, pledge, plunder, spoil. This has usually been identified with pan, from Lat. panus, piece of cloth. The Teutonic words for pledge—such as Du. pand, Ger. Pfand have been also traced to the same source; on the other hand these Teutonic forms have been connected with the word which appears in O. Eng. as pending, a penny, Ger. Pfennig, but this too has been referred to panus. (2) The smallest piece on the chessboard. This, in its early forms, pown, poun, &c., is taken from Fr. poin, poun, variants of pion, Med. Lat. podo, pedaeis, a foot soldier, from pes, foot.

PAWNBROKING (O. Fr. pan, pledge, piece, from Lat. panus; for “broking” see Broker), the business of lending money on the security of goods taken in pledge. If we desire to trace with minuteness the history of pawnbroking, we must go back to the earliest ages of the world, since the business of lending money on portable security (see Money-lending, and Usury) is one of the most ancient of human occupations. The Mosaic Law struck at the root of pawnbroking as a profitable business, since it forbade the taking of interest from a poor borrower, while no Jew was to pay another for timely accommodation. And it is curious to reflect that, although the Jew was the almost universal usurer and money-lender upon security of the middle ages, it is now very rare in Great Britain to find a Hebrew pawnbroker.

In China the pawnshop was probably as familiar two or three thousand years ago as it is to-day, and its conduct is still regulated quite as justly as in the case of a modern pawnshop. The Chinese institutions, too, are decidedly favourable to the borrower. He may, as a rule, take three years to redeem his property, and he cannot be charged a higher rate than 3% per annum—a regulation which would close every pawnshop in England in a month. Both Rome and Greece were as familiar with the operation of pawning as the modern poor all the world over; indeed, from the Roman jurisprudence most of the contemporary law on the subject is derived. The chief difference between Roman and English law is that under the former certain things, such as wearing apparel, furniture, and instruments of tillage, could not be pledged, whereas there is no such restriction in English legislation. The emperor Augustus converted the surplus arising to the state from the confiscated property of criminals into a fund from which sums of money were lent, without interest, to those who could pledge valuables equal to double the amount borrowed. It was, indeed, in Italy, and in more modern times, that the pledge system which is now almost universal on the continent of Europe arose.

This was virtually the Augustan system, but it is obvious that an institution which costs money to manage and derives no income from its operations must either limit its usefulness to the extent of the voluntary support it can command, or must come to a speedy end. Thus as early as 1108 something of the kind was started at Freising in Bavaria; while in 1350 a similar endeavour was made at Salins in Franche Comté, where interest at the rate of 7½% was charged. Nor was England backward, for in 1361 Michael Northury, or de Northborough, bishop of London, bequeathed 1000 silver marks for the establishment of a free pawnshop. These primitive efforts, like the later Italian ones, all failed. The Vatican was therefore constrained to allow the Sacri monti di pietà—no satisfactory derivation of the phrase has yet been suggested—to charge sufficient interest to their customers to enable them to defray expenses. Thereupon a learned and tedious controversy arose upon the lawfulness of charging interest, which was only finally set at rest by Pope Leo X., who, in the tenth sitting of the Council of the Lateran, declared that the pawnshop was a lawful and valuable institution, and threatened with excommunication those who should presume to express doubts on the subject. The Council of Trent infelicitously confirmed this decision, and at a somewhat later date we find St Charles Borromeo counselling the establishment of state or municipal pawnshops.

Long before this, however, monti di pietà charging interest for their loans had become common in Italy. The date of their establishment was not later than 1464, when the earliest of which there appears to be any record in that country—it was at Orvieto—was confirmed by Pius II. Three years later another was opened at Perugia by the efforts of two Franciscans, Barnabius Interamnensis and Fortunatus de Copolis. They collected the necessary capital by preaching, and the Perugian pawnshop was opened with such success that there was a substantial balance of profit at the end of the first year. The Dominicans endeavoured to preach down the “lending-house,” but without avail. Viterbo obtained one of 1469, and Sixtus IV. confirmed another to his native town in Savona in 1479. After the death of Brother Barnabius in 1474, a strong impulse was given to the creation of these establishments by the preaching of another Franciscan, Father Bernardino di Feltre, who was in due course canonized. By his efforts monti di pietà were opened at Assisi, Mantua, Parma, Lucca, Piacenza, Padua, Vicenza, Pavia and a number of places of less importance. At Florence the veiled opposition of the municipality and the open hostility of the Jews prevailed against him, and it was reserved to Savonarola, who was a Dominican, to create the first Florentine pawnshop, after the local theologians had declared that there was “no sin, even venial,” in charging interest. The readiness of the pope to give permission for the opening of such pawnshops on alarm in England is the more remarkable, that the papal capital possessed nothing of the kind until 1550, and even then owed the convenience to a Franciscan. From Italy the pawnshop spread gradually all over Europe. Augsburg adopted the system in 1591, Nuremberg copied the Augsburg regulations in 1618, and by 1622 it was established at Amsterdam, Brussels, Antwerp and Ghent. Madrid followed suit in 1705, when a priest opened a charitable pawnshop with a capital of fivepena taken from an almsh-box.

The institution was, however, very slow in obtaining a footing in France. It was adopted at Avignon in 1577, and at Arras in 1624. The doctors of the once powerful Sorbonne could not reconcile themselves to the lawfulness of interest, and when a pawnshop was opened in Paris in 1629, it had to be closed within a year. Then it was that Jean Boucher published his Défense des mons de piété. Marseilles obtained one in 1695; but it was not until 1777 that the first mont de piété was founded in Paris by...
PAWN BROKING 973

royal patent. The statistics which have been preserved relative to the business done in the first few years of its existence show that in the twelve years between 1777 and the Revolution, the average value of the pledges was 42 francs 50 cents, which is double the present average. The interest charged was 10% per annum, and large profits were made upon the sixteen million livres that were lent every year. The National Assembly, in an evil moment, destroyed the monopoly of the most de piètre, but it struggled on until 1795, when the competition of the money-lenders compelled it to close its doors. So great, however, were the extortions of the usurers that the people began to clamour for its reopening, and in July 1797 it re-commenced business with a fund of £20,000 found by five private capitalists. At first it charged interest at the rate of 36% per annum, which was gradually reduced, the gradations being 30, 24, 18, 15, and finally 12% in 1804. In 1806 it fell to 9%, and in 1878 to 7%. In 1806 Napoleon I. re-established its monopoly, while Napoleon III., as prince-president, regulated it by new laws that are still in force. In Paris the pledge-shop is, in effect, a department of the administration; in the French provinces it is a municipal monopoly; and this remark holds good, with modifications, for most parts of the continent of Europe.

In England the pawnbroker, like so many other distinguished personages, "came in with the Conqueror." From that time, indeed, to the famous legislation of Edward I., the Jew money-lender was the only pawnbroker. Yet, despite the valuable services which the class rendered, not infrequently to the Crown itself, the usurer was treated with studied cruelty—Sir Walter Scott's Isaac of York was no mere creation of fiction. These barbarities, by diminishing the number of Jews in the country, had, long before a decree of banishment, begun to make it worth the while of the Lombard merchants to settle in England. It is now as well established as anything of the kind can be that the three golden balls, which have for so long been the trade sign of the pawnbroker, were the symbol which which Lombard merchants hung up in front of their houses, and not, as has often been suggested, the arms of the Medici family. It has, indeed, been conjectured that the golden balls were originally three flat yellow effigies of byzants, or gold coins, laid heraldically upon a sable field, but that they were presently converted into balls the better to attract attention. In 1338 Edward III. pawned his jewels to the Lombards to raise money for his war with France. An equally great king—Henry V.—did much the same in 1415, and the Londoners, in the person of Henry VII., harried them a good deal. In the very first year of James I. "An Act against Brokers" was passed and remained on the statute-book until Queen Victoria had been thirty-five years on the throne. It was aimed at "counterfeit brokers," of whom there were then many in London. This type of broker was evidently regarded as a mere receiver of stolen goods, for the act provided that "no sale or pawn of any stolen jewels, plate or other goods to any pawnbroker in London, Westminster or Southwark shall alter the property therein," and that "pawnbrokers refusing to produce goods to their owner from whom stolen shall forfeit double the value."

In the time of Charles I. there was another act which made it quite clear that the pawnbroker was not intended to be a very respectable or trustworthy person. Nevertheless a plan was mooted for setting that king up in the business. The Civil War was approaching and supplies were badly needed, when a very ingenious Royalist proposed the establishment of a state "pawn-house." The preamble of the scheme recited how "the intolerable injuries done to the poor subjects by brokers and usurers that take 30, 40, 50, 60, and more in the hundredth, may be remedied and redressed, the poor thereby greatly relieved and eased, and His Majesty much benefited." That the king would have been "much benefited" is obvious, since he was to enjoy two-thirds of the profits, while the working capital of £100,000 was to be found by the city of London. The reform of what Shakespeare calls "breaking pawn" was in the air at that time, although nothing ever came of it, and in the early days of the commonwealth it was proposed to establish a kind of mont de piètre. The idea was emphasized in a pamphlet of 1651 entitled Observations manifesting the Conveniency and Commodity of Mount Piecyers, or Public Banks for Relief of the Poor or Others in Distress, upon Pawns. No doubt many a ruined cavalier would have been glad enough of some such means of raising money, but this radical change in the principles of English pawnbroking was never brought about. It is said that the Bank of England, under its charter, has power to establish pawnshops; and we learn from A Short History of the Bank of England, published in its very early days, that it was the intention of the directors, "for the ease of the poor," to institute a "Lombard" for small pawns at a penny a pound interest per month."

Throughout both the 17th and 18th centuries the general suspicion of the pawnbroker appears to have been only too well founded. It would appear from the references Fielding makes to the subject in Amelia, which was written when George II. was on the throne, that, taken in the mass, he was not a very scrupulous tradesman. Down to about that time it had been customary for publicans to lend money on pledges that their customers might have the means of drinking, but the practice was at last stopped by act of parliament. Nor was respect for the honesty of the business increased by the attempt of "The Charitable Corporation" to conduct pawnbroking on a large scale. Established by charter in 1707, "this nefarious corporation," as Smollett called it, was a swindle on a large scale. The directors gambled wildly with the shareholders' money, and in the end the common council of the city of London petitioned parliament for the dissolution of this dishonest concern, on the ground that "the corporation, by affording an easy method of raising money upon valuables, furnished the thief and pickpocket with a better opportunity of selling their stolen goods, and enables an intending bankrupt to dispose of the goods he buys on credit for ready money, to the defrauding of his creditors." When the concern collapsed in 1731 its cashier was Mr George Robinson, M.P. for Marlow. In company with another principal official he disappeared, less than £30,000 being left of a capital which had once been twenty times as much.

The pawnbroker's licence dates from 1785, the duty being fixed at £10 in London and £5 in the country; and at the same time the interest chargeable was settled at 3/4% per Modern Pawns. month, the duration of loans being confined to one year. Five years later the interest on advances charged upon jewels was raised to 15% per annum. Modern history of legislation affecting pawnbroking begins, however, in 1800, when the act of 39 & 40 Geo. III. c. 99 (1800) was passed, in great measure by the influence of Lord Eldon, who never made any secret of the fact that, when he was a young barrister without briefs, he had often been indebted to the timely aid of the pawnshop. The pawnbrokers were grateful, and for many years after Lord Eldon's death they continued to drink his health at their trade dinners. The measure increased the rate of interest to a halfpenny per half-crown per month, or fourpence in the pound per mensem—that is to say, 20% per annum. Loans were to be granted for a year, although pledges might be redeemed up to fifteen months, and the first week of the second month was not to count for interest. The act worked well, on the whole, for three-quarters of a century, but it was twice found necessary to amend it. Thus in 1815 the licence fees were raised to £15 and £7, 10s. for London and the country respectively; another act of 1840 abolished the reward to the "common informer" for reporting illegal rates of interest; while in 1860 the pawnbroker was empowered to charge a halfpenny for the pawn-ticket when the loan was under five shillings. As time went on, however, the main provisions of the act of 1800 were found to be very irksome, and the Pawnbrokers' National Association and the Pawnbrokers' Defence Association worked hard to obtain a liberal revision of the law. It was argued that the usury laws had been abolished for the whole of the community with the
single exception of the pawnbroker who advanced less than £10. The limitations of the act of 1800 interfered so considerably with the pawnbrokers’ profits that, it was argued, they could not afford to lend money on bulky articles requiring extensive storage room. In 1870 the House of Commons appointed a Select Committee on Pawnbrokers, and it was stated in evidence before that body that in the previous year 207,780,000 pledges were lodged, of which between thirty and forty millions were lodged in London. The average value of pledges appeared to be about 45s., and the proportion of articles pawned dishonestly was found to be only 1 in 14,000. Later official statistics show that of the forfeited pledges sold in London less than 20 per million are claimed by the police.

The result of the Select Committee was the Pawnbrokers Act of 1872, which repealed, altered and consolidated all previous legislation on the subject, and is still the measure which regulates the relations between the public and the "brokers of pawn." Based mainly upon the Irish law passed by the Union Parliament it put an end to the old irritating restrictions, and reduced the annual tax in London from £35 to the £7, 10s. paid in the provinces. By the provisions of the act (which does not affect loans above £50) a pledge is redeemable within one year, and seven days of grace added to the year. Pledges pawned for 10s. or under and not redeemed in time become the property of the pawnbroker, but pledges above 10s. are redeemable until sale, which must be by public auction. In addition to one halfpenny for the pawn-ticket—which is sometimes not charged for very small pawns—the pawnbroker is entitled to charge as interest one halfpenny per month on every 2s. or part of 2s. lent where the loan is under 40s., and on every 2s. 6d. where the loan is above 40s. "Special contracts" may be made where the loan is above 40s. at a rate of interest agreed upon between lender and borrower. Unlawful pawning of goods not the property of the pawner, and taking in pawn any article from a person under the age of twelve, or intoxicated, or any linen, or apparel or unfinished goods or materials entrusted to wash, make up, &c., are, inter alia, made offences punishable by conviction. A new pawnbroker must produce a magistrate’s certificate before he can receive a licence; but the permit cannot be refused if the applicant gives sufficient evidence that he is a person of good character. The word "pawnbroker" must always be inscribed in large letters over the door of the shop. Elaborate provisions are made to safeguard the interests of borrowers whose unredeemed pledges are sold under the act. Thus the sales by auction may take place only on the first Monday of January, April, July and October, and on the following days should one not be sufficient. This legislation was, no doubt, favourable to the pawnbroker rather than to the borrower. The annual interest on loans of 2s. had been increased by successive acts of parliament from the 6% at which it stood in 1784 to 25% in 1800, and to 27 in 1860—a rate which was continued by the measure of 1872. The annual interest upon a loan of half-a-crown is now 260%, as compared with 175 in 1860 and 86 in 1784; while the extreme point is reached in the case of a loan of 2s. for three days, in which case the interest is at the rate of 1000%. The annual rate of interest in England and in Ireland was abated in 1873 and 1874 by the Salvation Army, and in 1894 the London County Council considered the practicability of municipal effort on similar lines; but in neither case was anything done.

The growth of pawnbroking in Scotland, where the law as to pledge agrees generally with that of England, is remarkable. Early in the 19th century there was only one pawnbroker in that country, and in 1833 the number reached only 52. Even in 1865 there were no more than 312. It is probable that at the present moment Glasgow and Edinburgh together contain nearly as many as that total. In Ireland the rates for loans are practically identical with those charged in England, but a penny instead of a halfpenny is paid for the ticket. Articles pledged for less than £1 must be redeemed within six months, but nine months are allowed when the amount is between 30s. and £2. For sums over £2 the period is a year, as in England. In Ireland, too, a fraction of a month is calculated as a full month for purposes of interest, whereas in England, after the first month, fortnights are reckoned. In 1838 there was an endeavour to establish monts de piété in Ireland, but the scheme was so unsuccessful that in 1841 the eight charitable pawnshops that had been opened had a total adverse balance of £5340. But 1847 only three were left, and eventually they collapsed likewise.

The pawnbroker in the United States is, generally speaking, subject to considerable legal restriction, but violations of the laws and ordinances are frequent. Each state has its own regulations, but those of New York and Massachusetts may be taken as fairly representative. "Brokers of pawn" are usually licensed by the mayors, or by the mayors and aldermen, and in Boston the police commissioners are the licensing authority. In the state of New York permits are renewable annually on payment of $500, and the pawnbroker must file a bond with the mayor, executed by himself and two responsible sureties, in the sum of $10,000. The business is conducted on much the same lines as in England, and the rate of interest is 3% per month for the first six months, and 2% monthly afterwards. Where, however, the loan exceeds $100 the rates are 2% and 1½% respectively. To exact higher rates is a misdemeanour. Unredeemed pledges may be sold at the end of a year. Pawnbrokers are not allowed to engage in any kind of second-hand business. New York contains one pawn-shop to every 12,000 inhabitants, and most of the pawnbrokers are Jews. In the state of Massachusetts unredeemed pledges may be sold four months after the date of deposit. The licensing authority may fix the rate of interest, which may vary for different amounts, and in Boston every pawnbroker is bound to furnish to the police daily a list of the pledges taken in during the preceding twenty-four hours, specifying the hour of each transaction and the amount lent.

The fact that on the continent of Europe monts de piété are almost invariably either a state or a municipal monopoly necessarily places them upon an entirely different footing from the British pawnshop, but, compared with the English system, the French is very elaborate and rather cumbersome. Moreover, in addition to being slow in its operation, it is, generally speaking, based upon the supposition that the borrower carries in his pockets "papers" testifying to his identity. On the other hand, it is argued that the English borrower of more than £2 is at the mercy of the pawnbroker in the matter of interest, that sum being the highest for which a legal limit of interest is fixed. The rate of interest upon a "special contract" may be, and often is, high. For the matter of that, indeed, this system of obtaining loans is always expensive, either in actual interest or in collateral disadvantages, whether the lender be a pawnbroker intent upon profit, or the official of a mont de piété. In Paris the rate charged is 7½%, and even then the business is conducted at a loss except in regard to long and valuable pledges. Some of the French provincial rates are as high as 12½%, but in almost every case they are less than they were prior to the legislation of 1831 and 1852. The French establishments can only be created by decree, and the President of the Republic, with the consent of the council communal. In Paris the prefect of the Seine presides over the business; in the provinces the mayor is the president. The administrative council is drawn one-third each from the council communal, the governors of charitable societies, and the townpeople. A large proportion of the capital required for conducting the institutions has to be raised by loan, while some part of the property they possess is the product of gifts and legacies. The profits of the Paris mont de piété are paid over to the "Assistance Publique," the comprehensive term used by France to indicate the body of charitable foundations. Originally this was the rule throughout France, but now many of them are entirely independent of the charitable institutions. Counting the head office, the branches and the auxiliary shops, the Paris establishment has its doors open in some fifty or sixty districts; but the volume of its annual business is infinitely smaller than that transacted by the London pawnbrokers. The amount to be
PAWNBROKING 975

advanced by a municipal pawnshop is fixed by an official called the _commissaire-priseur_, who is compelled to load the scales against the borrower, since, should the pledge remain unredeemed and be sold for less than was lent upon it, he has to make good the difference. This official is paid at the rate of ½ % upon loans and renewals, and 3 % on the amount obtained by the sales of forfeited pledges. This is obviously the weakest part of the French system. The Paris mont de piété undertakes to lend four-fifths of the intrinsic value of articles made from the precious metals, and two-thirds of that of other articles. The maximum and minimum that may be advanced are also fixed. The latter varies in different parts of the country from one to three francs, and the former from a very small sum to the 10,000 francs which is the rule in Paris. Loans are granted for twelve months from the right of renewal, and in case of default the pledged may then be sold by auction, but the proceeds may be claimed by the borrower at any time within three years. Pledges may be redeemed by instalments.

Somewhere between forty and fifty French towns possess municipal pawnshops, a few of which, like those of Grenoble and Montpellier, having been endowed, charge no interest. Elsewhere the rate varies from nil in some towns, for very small pledges, to 10 %. The constant tendency throughout France has been to reduce the rate. The great establishment in Paris obtains part of its working capital—reserves and surplus forming the balance—by borrowing money from the Bank of France for periods ranging to 20 years, at a rate of 4½%. Under this law the Paris mont de piété makes advances upon securities at 6 %, plus a duty of 5 centimes upon every hundred francs. The maximum that can be lent in this way is £500, but the rate varies according to the face value of government stock and on its own bonds, and 75 % upon other securities; but 60 % only may be advanced on railway shares. These advances are made for six months. Persons wishing to borrow a larger sum than sixteen francs from the Paris mont de piété have to produce their papers of identity. In every case a numbered metal check is given to the customer, and a duplicate is attached to the article itself. The appraising clerks decide upon the value that can be given to the pledged thing by comparing it with other like articles, or by ascertaining the average price of articles of the same description that have been sold in the permanent pawnshops, and the mont de piété, as a rule, charge 80 % of the value, and a fixed interest of 6 % is charged upon these securities. The values are fixed by professional valuers, who are liable to make good any loss that may result from over-estimation. The bulk of the loans are under £5, and the state office is used less by the poor than by the middle classes. Loans run for six months, but a further six months' grace is allowed for redemption before the article pledged can be sold by auction. The net annual profit usually amounts to little more than 1 % upon the capital employed. The pawnbroking laws of Austria-Hungary are very similar to those which prevail in England. Free trade exists, and the private trader, who does most of the business, has to obtain a government concession and deposit caution-money varying in amount from £80 to £150, according to the size of the town. He has, however, to compete with the monts de piété or Vorleihhäuser, which are sometimes municipal and sometimes state institutions. The chief of these is the imperial pawn office of Vienna, which was founded with charitable objects by the emperor Joseph I. in 1707, and one-half of the annual surplus has still to be paid over to the Vienna poor fund. Here, as in Berlin, the profits are relatively small. Interest is charged at the uniform rate of 10 %, which is calculated in fortnightly periods, however speedily redemption may follow upon pawning. For small loans varying from two to three kronen, 5 % only is charged. The Hungarian state and municipal institutions appear on the whole, to compete somewhat more successfully with the private firm than is the case in Austria. In Italy, the "country of origin" of the mont de piété, the institution still flourishes. It is, as a rule, managed by a committee or commission, and the regulations follow pretty closely the lines of the one in Rome, which never lends less than 10d. or more than £50. Five-fourths of the value is lent upon gold, silver and jewels, and two-thirds upon other articles. The interest, which is reckoned monthly, varies with the amount of the loan from 5 to 7 % but no interest is chargeable upon loans up to 5 lire. A loan runs for six months, and may be renewed for similar periods up to a maximum of five years. If the renewal does not take place within a fortnight of the expiration of the ticket, the pledge is sold, any surplus there may be being paid to the pawnee. When more than 10 lire is lent there is a charge of 1 % for the ticket. Agencies of the mont de piété are scattered about Rome, and carry on their business under the same rules as the central office, with the disadvantage to the borrower that he has to pay an "agent's
PAWNEE—PAWTUCKET.

fee of 2%, which is deducted from the loan. Private pawnshops also exist in Italy, under police authority; but they charge very high interest.

The Monts de piété in Spain have for a generation past been inseparably connected with the savings banks. We have already seen that the institution owes its origin in that country to the charitable exertions of a priest who charged no interest, and the system grew until in 1840, a century after his death, the Mont de piété began to receive the sums deposited in the savings bank, which had just been established, for which it paid 5% interest. In 1869 the two institutions were united. This official pawnshop charges 6% upon advances which run for periods varying from four to twelve months, according to the nature of the article pledged, and a further month's grace is allowed before the pledges are sold by auction. Private pawnbrokers are also very numerous, especially in Madrid; but their usual charges amount to about 60% per annum. They appear, however, to derive advantage from making larger advances than their official rivals, and from doing business during more convenient hours. In Portugal the monte pio is an amalgamation of bank, benefit society and pawnshop. Its business consists chiefly in lending money upon marketable securities, but it also makes advances upon plate, jewelry and precious stones, and it employs officially licensed valuers. The rate of interest varies with the bank rate, which it slightly exceeds, and the amount advanced upon each article is about three-fourths of its certified value. There is in Portugal a second class of loan establishment answering exactly to the English pawnshop. The pawnbroker is compelled to deposit a sum, in acceptable securities, equal to the capital he proposes to embark, and the register of his transactions must be submitted quarterly to the chief of the police for examination. As regards small transactions, there appears to be no legal limit to the rate of interest. The sale of unredeemed pledges is governed by the law affecting the "monte pio geral."

In Russia the state maintains two pawnbroking establishments, one at St. Petersburg and the other at Moscow, but only articles of gold and silver, precious stones and ingots of the precious metals are accepted by them. Advances are made upon such securities at 6% per annum, and the amounts of the loans are officially limited. Loans run for twelve months, with a month's grace before unredeemed pledges are put up to auction. The bulk of this class of business in Russia is, however, conducted by private companies, which advance money upon all descriptions of movable property except stocks and shares. The interest charged is not allowed to exceed 1% per month, but there is an additional charge of 1/2% per month for "insurance and safe keeping." The loan runs for a year, with two months' grace for redemption before sale. There are also a certain number of pawnshops conducted by individuals, who find it very difficult to compete with the companies. These shops can only be opened by a police permit, which runs for five years, and securities of £400 to £700 have to be deposited; 2% per month is the limit of interest fixed, and two months' grace is allowed for redemption after the period for which an article is pledged.

Pawnbrokering in Denmark dates from 1753, when the Royal Naval Hospital was granted the monopoly of advancing money on pledges and of charging higher interest than the law permitted. The duration of a loan is three months, renewals being allowed. The old law was extended in 1867, and now all pawnbrokers have to be licensed by the municipalities and to pay a small annual licence fee. The rate of interest varies from 6 to 12% according to the amount of the loan, which must not be less than 7d., and unredeemed pledges must be sold by auction. In Sweden there are no special statutes affecting pawnbroking, with the exception of a proclamation by the governor of Stockholm prohibiting the lending of money upon articles which may be suspected of having been stolen. Individuals still carry on the business on a small scale, but the bulk of it is now conducted by companies, which give general satisfaction. For many years the two were in Stockholm a municipal establishment charging 10% for loans paid out of the city funds. The cost of administration was, however, so great that there was an annual loss upon its working, and the opportunity was taken to abolish it when, in 1880, a private company was formed called the "Pant Aktie Bank," to lend money on furniture and wearing apparel at the rate of 3 öre per krone a month, and 2 öre per krone a month on gold, silver and other valuable: a krone, which equals 1s. 13d., contains 100 öre. Some years later an opposition was started which charged only half these rates, with the result that the original enterprise reduced its interest to the same level, charging, however, 2 öre per krone per mensem for bulky articles—a figure which is now usual for pledges of that description. The money is lent for three months, and at the end of five months the pledge, if unredeemed, is sold by auction under very carefully prescribed conditions. In Norway a police licence is required for lending money on pawn where the amount advanced does not exceed £4, 10s. Beyond that sum no licence is necessary, but the interest charged must not exceed such a rate as the king may decide. The fate of pawnbroking in Switzerland appears to be not very dissimilar from that of the Jews who is fabled to have once started in business at Aberdeen. Nevertheless the cantons of Bern and Zürich have elaborate laws for the regulation of the business. In Zürich the broker must be licensed by the cantonal government, and the permit can be refused only when the applicant is "known to be a person undeserving of confidence." Regular books have to be kept, which must be at all times open to the inspection of the police, and not more than 1% interest per month must be charged. A loan runs for six months, and unredeemed pledges may be sold by auction a month after the expiration of the fixed period, and then the sale must take place in the parish in which the article was pledged. No more than two persons at a time have ever been licensed under this law, the business being unprofitable owing to the low rate of interest. In the canton of Bern there were once two pawnbrokers. One died and the other put up his shutters. The Zürich cantonal bank, however, conducts a pawnbroking department, which lends nothing under 4s. or over £40 without the special sanction of the bank commission. Loans must not exceed two-thirds of the trade value of the pledge, but 80% may be lent upon the intrinsic value of gold and silver articles. The establishment makes practically no profit. The Swiss disinclination to go to the pawnshop is, perhaps, accounted for in some measure by the growing number of dealers in second-hand articles, to whom persons in want of ready money sell outright such things as are usually pledged, in the hope of subsequently buying them back. Since, however, the dealer is at liberty to ask his own price for repurchase, the expectation is often illusory, and can usually be fulfilled only upon ruinous terms. (J. P.-B.)

PAWNEE (perhaps from the native word for "horn," in allusion to their war-paint lock, which was "dressed" so as to stand straight up), a tribe of North-American Indians of Caddoan stock. They formerly lived on the Platte river in Nebraska. They call themselves Skidi-kahikis ("men of men"). They were a brave, war-loving tribe, whose history was one of continual strife with their neighbours. In 1823 their village was burned by the Delawares, and in 1838 the tribe suffered severely from small-pox, the death-roll being, it is said, 200. By treaty in 1837 they had ceded their territory south of the Platte, and in 1858 they surrendered all their remaining land except a strip on the Loup River. Here they lived till 1874, when they moved to a reservation in Indian Territory (now Oklahoma), where they now are.

Pawtucket, a city of Providence county, Rhode Island, U.S.A., on the Blackstone river (known below the Pawtucket Falls here as the Pawtucket or Seekonk river), 4 m. N. of Providence, and near the city of Central Falls. Pop. (1905, state census), 43,387, of whom 14,369 were foreign-born, including 4273 English, 3484 Irish, 2700 French Canadians, and 1198
Scotch (1910), 51,622. Pawtucket is served by the New York, New Haven & Hartford railroad; and the river is navigable below the falls. The city lies on both sides of the river and its land area in 1906 was nearly 8.6 m. The east bank of the river raises quite abruptly 15-30 ft., but back of this the surface is level or only slightly undulating. On the west side the surface is more diversified. The Blackstone River here makes a picturesque plunge of nearly 50 ft. (Pawtucket Falls) over an irregular mass of rocks, providing a good water-power. The most attractive public building is the Sayles Memorial Library, erected (1890-1902) by Frederick Clark Sayles (1835-1902) in memory of his wife. The city has a park of 181 acres in the east end, a park of 55 acres on the west side, three small parks near the business centre, a soldiers’ monument, a home for the aged, an emergency hospital, and a state armoury. Manufacturing is the principal industry, and the value of the factory products increased from $19,271,582 in 1900 to $25,626,809 in 1905, or 34.1%. More than one-half the value for 1905 was represented by textiles. Other important manufactures in 1905 were foundry and machine-shop products, packed meats, and electrical machinery, apparatus and supplies. The commerce of the city has been much increased by the deepening and widening of the channel of the Pawtucket river by the United States government. In 1867 the river could not be navigated at low water by boats drawing more than 5 ft. of water, but by March 1905 the government had constructed a channel 100 ft. wide and 12 ft. deep at low water, and Congress had passed an act for increasing the depth to 16 ft.; in 1907 the Federal Congress and the general assembly of the state made appropriations to complete the work.

That portion of Pawtucket which lies east of the river was originally a part of the township of Rehoboth, Massachusetts, but in 1812 the township of Seekonk was set apart from Rehoboth, in 1828 the township of Pawtucket was set apart from Seekonk, and in 1862 almost all of the Massachusetts township of Pawtucket was transferred to Rhode Island. The portion west of the river was taken from the township of North Providence and annexed to the township of Pawtucket in 1874, and in 1885 Pawtucket was chartered as a city. The first settlement within the present city limits was made about 1670 on the west side by Joseph Jenks (c. 1632-1717), a manufacturer of domestic iron implements. His manufactory was destroyed during King Philip’s War, but he rebuilt it, and until a century later the industries on the west side were managed largely by his family. In 1790 Samuel Slater reproduced here the Arkwright machinery for the manufacture of cotton goods; this was the first manufactory of the kind that had any considerable success in the United States, and his old mill is still standing in Mill Street.

See B. Grieve, An Illustrated History of Pawtucket, Central Falls, and Victory (Pawtucket, 1897).

**PAX** (Lat. for “peace”), the name given in ecclesiastical usage to a small panel or tablet decorated usually with a representation of the Crucifixion, which in the Roman ritual was kissed at the eucharistic service by the celebrating priest, then by the other priests and deacons, and then by the congregation. The “Pax” is also known by the names *osculatorium, tabula pacis* and *pax-bred* (i.e. “pax-board”). The use of the “pax” dates from the 13th century, and it is said to have been first introduced in England in 1250 by Archbishop Walter of York. It took the place of the actual “kiss of peace” (*osculum sanctum, or osculum pacis*) which was in the Roman Mass given by the bishop to the priests, and took place after the consecration and before communion. In the Greek Church the kiss (*eifieron, δοξασμος*) takes place at the beginning of the service, and now consists in the celebrating priest kissing the oblation and the deacons. (See E. Haydn, Liturgies Eastern and Western, 1869.)

Paxo is the scene of the legendary figure, recorded in Plutarch’s *De defectu oraculorum*, of the cry “Pan is dead” (see Paxos).

**PAXTON, SIR JOSEPH** (1801-1865), English architect and ornamental gardener, was born of humble parents at Milton Bryant, near Woburn, Bedfordshire, on the 3rd of August 1801, and was educated at the grammar school of that town. Having served his apprenticeship as gardener from the age of fifteen, and himself constructed a large pond when gardener to Battlesden in 1821, he was in 1823 employed in the arboretum at Chiswick, the seat of the duke of Devonshire, and eventually became superintendent of the duke’s gardens and grounds at Chatsworth, and manager of his Derbyshire estates. In 1836 he began to erect a grand conservatory 300 ft. in length, which was finished in 1840, and formed the model for the Great Exhibition building of 1851. In this year Paxton received the honour of knighthood. Perhaps his most interesting design was that for the mansion of Baron James de Rothschild at Ferrières in France, but he designed many other important buildings. His versatility was shown in his organization of the Army Works Corps which served in the Crimea, his excellent capacity as a man of business in railway management, and his enterprising experiments in floriculture. In 1854 he was chosen M.P. for Coventry, which he continued to represent in the Liberal interest till his death at Sydenham on the 8th of June 1865. Paxton was elected in 1826 a fellow of the Horticultural Society. In the following year he married Sarah Bown. In 1833 he became a fellow of the Linnean Society, and in 1843 he was made a knight of the order of St Vladimir by the emperor of Russia.

He was the author of several contributions to the literature of horticulture, including a *Practical Treatise on the Culture of the Dahlia* (1838), and a *Pocket Botanical Dictionary* (2nd ed., 1840). He edited the *Garden Calendar*, the *Horticultural Register*, and the *Botanical Magazine*.

**PAYMASTER-GENERAL**, in England, a public officer and a member of the ministry for the time being. The office was, by statutes passed in 1673 and 1848, consolidated with other offices through which moneys voted by parliament were previously paid. The paymaster-general is appointed by sign manual warrant, he is unpaid, and does not require to offer himself for re-election on acceptance of office. The money appropriated by parliament for the various services of the country is placed
by order of the Treasury to the account of the paymaster-general, and a communication to that effect made to the comptroller and auditor-general. The paymaster-general then makes all payments required by the various departments in accordance with the parliamentary vote. The duties of the office are carried out by a permanent staff, headed by an assistant paymaster-general, acting on powers granted by the paymaster-general.

**PAYMENT (Fr. paiement, from payre, to pay; Lat. pacare, to appease, pas, peace), the performance of an obligation, the discharge of a sum due in money or the equivalent of money. In law, in order that payment may extinguish the obligation it is necessary that it should be made at a proper time and place, in a proper manner, and by and to a proper person. If the sum due be not paid at the appointed time, the creditor is entitled to sue the debtor at once, in spite of the readiness of the latter to pay at a later date, subject, in the case of bills and notes, to the allowance of days of grace. In the common case of sale of goods for ready money, a right to the goods vested at once upon sale in the purchaser, a right to the price in the seller; but the seller need not part with the goods till payment of the price.

Payment may be made at any time of the day upon which it falls due, except in the case of mercantile contracts, where the creditor is entitled to receive payment only from the time the money has been tendered the seller's business. If no place be fixed for payment, the defaulter is bound to find, or to use reasonable means to find, the creditor, unless the latter be abroad. Payment must be made in money which is a legal tender (see below), unless the creditor waives his right to payment in money by accepting some other mode of payment, as a negotiable instrument or a transfer of credit. If the payment be by negotiable instrument, the instrument may operate either as an absolute or as a conditional discharge. In the ordinary case of payment by cheque the creditor accepts the cheque conditionally upon its being honoured; if it be dishonoured, he is entitled to his original rights. If payment be made through the post, in a letter properly directed, and it be lost, the debt is discharged if there was a direction so to transmit the money. The creditor has a right to payment in full, and is not bound to accept part payment unless by special agreement. Part payment is sufficient to take the debt out of the Statute of Limitation. It is a technical rule of English law that payment is not only sufficient to discharge the debt but, by acceptance, a sufficient discharge. In full satisfaction, there is no defence to a subsequent action for the debt. The reason of this rule seems to be that there is no consideration for the creditor foregoing his right to full payment. In order that payment of a smaller sum may satisfy the debt, it must be made by a person other than the person originally liable, or at an earlier date, or at another place, or in another manner than the date, place, or manner contracted for. Thus a bill or note may be satisfied by money to a less amount, or a money debt by a bill or note to a less amount; a debt of £100 cannot be discharged by payment of £90 (unless the creditor execute a release under seal), though it may be discharged by payment of £10 before the day appointed, or by a bill for £10. Payment must in general be made by the debtor or his agent, or by a stranger to the contract with the assent of the debtor. If payment be made by a stranger without the assent of the debtor, it seems uncertain how far English law regards such payment as a satisfaction of the debt. If the debtor ratifies the payment, it then undoubtedly becomes a satisfaction. Payment must be made to the creditor or his agent. A bonâ fide payment to an apparent agent may be good, though it has in fact no authority to receive it. Such payment will usually be good where the authority of the agent has been countermanded without notice to the debtor. The fact of payment may be presumed, as from lapse of time. Thus payment of a testator's debts is generally presumed after twenty years. A written receipt is only presumptive and not conclusive evidence of payment. By the Stamp Act 1891 a duty of one Penny is imposed upon a receipt for or upon the payment of money amounting to £2 or upwards, and also a fine of £10 upon any person who, in any case where a receipt would be liable to duty, refuses to give a receipt duly stamped. If payment be made under a mistake, it may be recovered, but it is otherwise if it be made under a misapprehension of liability. Payment into court is regulated by the Rules of the Supreme Court, O. xxii. The fact that money has been paid into court may not be questioned in a jury. Money may sometimes be paid into court by insolvency trustees. Payment of money out of court is obtained by the order of the court upon petition or summons or otherwise, or simply on the request or the written authority of the person entitled to it.

**Payment of Wages to Co-operators and Workmen.**—The laborer is the principal benefactor of society. Payment of wages to co-operators and workmen otherwise than in coin is prohibited. See **LABOUR LEGISLATION: Truck**. Domestic or agricultural servants are excepted. Payment of wages in public-houses (except in the case of domestic servants) is prohibited. **Tender.**—This is payment duly proffered to a creditor, but rendered abortive by the act of the creditor. In order that a tender may be good in law it must as a rule be made under circumstances which indicate an intention to part with the money tendered. The money tendered must be made a tender, unless the creditor waive his right to a legal tender, as where he objects to the amount and not the mode of tender. Bank of England notes are legal tender for any amount, and may be tendered to any amount, silver up to 40s., bronze up to 1s. (Coin Act 1870). Any gold coinage, whether British, colonial, or foreign, may be made legal tender by proclamation. The effect of the tender is not to discharge the debt, but to enable the debtor, when sued for the debt, to pay the money into court and to get judgment for the costs of his defence.

**Scotland.**—The law of Scotland as to payment agrees in most points with that of England. Where a debt is constituted by writ (see below), payment, if once made, is irrevocable. Where it is constituted by writ, payment to the amount of £100 Scots may be proved by witnesses; beyond that amount it can only be proved by writ or oath of party. The term tender seems to be strictly applied only to a judicial offer of a sum for damages and expenses, made by the defender during litigation, not to an offer made by the debtor before litigation. Bank of England notes are not legal tender in Scotland or in Ireland.

**United States.**—In the United States the law as a rule does not materially differ from English law. In some states, however, money may be recovered, even when it has been paid under a mistake of law. The question of legal tender has an important bearing on public finance. Notes are legal tender in the hands of the bank itself. Gold is legal tender to any amount, silver up to 40s., bronze up to 1s. (Coin Act 1870). Any gold coinage, whether British, colonial, or foreign, may be made legal tender by proclamation. After much litigation, the Supreme Court of the United States decided in 1871 (Knox v. Lee) in favour of the constitutionality of these acts, both as to contracts made before and after they were passed. These notes are legal tender for all purposes except duties on imports and interest on negotiable debt. All gold coins and standard silver dollars are legal tender to any amount. Silver coins below the denomination of a dollar are legal tender up to $10, and cent and 5-cent pieces legal tender up to $5. It falls exclusively within the jurisdiction of Congress to declare paper or copper money a legal tender. By the constitution of the United States, "no state shall . . . make anything but gold and silver coin a tender in payment of debts" (art. i, § 10). (T.A.I.)

**PAYMENT OF MEMBERS.**—From time to time proposals have been made to reintroduce in the English parliamentary system a practice which is in vogue in the United States; that of paying a state salary to members of the legislative body. In the earlier history of the English parliament the payment of commoners or representatives of the people was for long the practice. They had first been summoned to the great council of the realm in 1265 in the reign of Henry III. The shires and boroughs they represented paid them for their services, and reimbursed the expenses they were put to in journeying to and from the place of meeting. In 1322, by a statute of Edward III., the salary of a knight was fixed at 4s. a day, and that of a citizen or burgler at 2s. a day. These payments could be enforced by writs issued after the dissolution of each parliament, and there are many instances of the issue of such writs down to the reign of Henry VIII.; while the last known instance is that of one Thomas King, who in 1681 obtained...
PAYMENT OF MEMBERS

979

a writ for his salary against the corporation of Harwich. The practice of the payment of members of parliament gradually fell into desuetude, and in the second parliament of Charles II. strong disapproval was expressed of the practice. Its gradual abandonment was due first to the difficulty of securing representatives in the early parliaments. Men of business were unwilling to detach themselves from their affairs, as travel was slow and dangerous; in addition to the perils of the journey there was the almost certain knowledge that a safe return from parliament would be followed by the ill will of the member's neighbours, for every meeting of parliament was but a device on the part of the sovereign for inflicting some new form of taxation, and a refusal to vote such taxation was but to incur the royal displeasure. The towns themselves were equally disinclined to bear the burden of their member's maintenance, and resolutions simply specified an "adequate allowance"; but on the 7th of March 1906 a resolution was carried (by 348 votes to 110) in favour of an allowance "at the rate of £300 per annum."

Appended are the salaries paid to legislators in various countries in 1910.

BRITISH COLONIES

South Africa.—Before the South Africa Act 1909, which brought about the union of Cape Colony, Natal, Orange River Colony and the Transvaal, each colony had its own legislature. For purposes of comparison, the salaries which were paid to the members of these state legislatures are given below. The act of 1909 reduced the colonies to the position of dependent provinces, entrusted only with local administration by means of provincial councils. The act of 1909 (§ 76) enacts that the members of provincial councils shall receive such allowances as shall be determined by the governor-general in council. Members of the new South African legislature receive £400 a year, subject to a deduction of £3 a day for each day's non-attendance.

Cape Colony.—Members of either house were paid £25 a day, and the members of the Legislative Assembly received £15 a day. The Town an additional £3 a day, for a period not exceeding 90 days.

Natal.—Members of the legislature were not paid, but those residing more than 2 mi. from the seat of government received a travelling allowance of £1 1 a day during the session.

Orange River Colony.—At the end of the session each member received £150, and an additional £2 for each day of actual attendance, but not more than £300 in all.

Transvaal Colony.—As in the Orange River Colony.

Canada.—Federal government. Members of both houses are paid $2500 per session, but subject to a deduction of $15 a day for each day of non-attendance.

Ontario.—Members of the Legislative Assembly are paid mileage and an allowance of $5 a day for 30 days, with a maximum of $1000.

Quebec.—Members of the Legislative Assembly are paid $6 a day during the session.

Nova Scotia.—Members are paid an indemnity of $500 for the session.

New Brunswick.—Members of the Legislative Assembly receive $500 per session and travelling expenses.

Manitoba.—Members of the Legislative Assembly receive $1000 per session and travelling expenses.

British Columbia.—Members of the Legislative Assembly receive $1200 per session and travelling expenses.

Prince Edward Island.—Members of the Legislative Assembly receive $160 per annum and travelling expenses, with an additional $12 for postage.

Australasian Commonwealth.—Members of parliament receive £600 per annum.

New South Wales.—Members of the Legislative Assembly receive £300 per annum, and free travel over all government railways and tramways. They are also given official stamped envelopes for their postal purposes.

Victoria.—Members of the Legislative Assembly receive £300 per annum and free passes over all railways.

Queensland.—Members of the Legislative Assembly receive £300 per annum, with travelling expenses.
